As social mobility allowed people to move to external suburbs indicative of their social station, the poor internal sections of major cities were left to the poorer migrants or immigrants, who in turn also left when their economic conditions improved. However, within the city centers, more lucrative housing developments were also constructed, as many wealthy people would decide to move close to the downtown districts to enjoy the proximity to what was deemed a more exciting urban lifestyle than the humdrum suburbs and exurbs. In the United States, the poorest neighborhoods were often occupied by African Americans and recent immigrants (Russian Jews, Italians, and Poles) due to either racial or economic status. Poor neighborhoods were often adjacent to the city centers, often at the opposite end of a more affluent internal community and often geographically separated by roads or train tracks or the downtown or political center itself (for example, West End and East End in London).

While public transportation initially shaped the outgrowth of cities to a certain radius from the city center, the automobile allowed for an even greater expansion of conurbations, particularly in the United States. The automobile allowed for the middle class to live farther from the city center in exurban, almost rural environs and commute to their employment in the city center. Moreover, centers of distribution and commerce in the suburbs were already close to the residents of those outlying districts, allowing a level of detachment from the old city center (for example, Hollywood and Los Angeles). The urban core of the city was subsequently developed into surrounding ethnic neighborhoods (e.g., Chinatowns), working-class neighborhoods (e.g., Wedding in Berlin), or trendy affluent neighborhoods (e.g., Soho in London and Greenwich Village in New York City), most often with their own series of shopping districts and entertainment. Moreover, national and international trade allowed for the creation of consumer goods that entered all Western countries through major cities, which were the hub of the expanding global economy. While other world regions experienced similar processes of urbanization (prior to 1945) in their major industrial cities and political centers (e.g., Buenos Aires, Shanghai, and Tokyo), they would experience a far more accelerated rate of urbanization after 1945.

Railroads

By 1900, railroads interconnected much of the industrialized world, areas of Asia, European colonial possessions in Africa, and the rapidly growing economic centers in Central and South America. Although in most of the world the era of major railroad construction was coming to an end, innovations in operations and the

German soldiers use the railway to transport a long-range cannon during World War I. (Bettmann/Corbis)

➤ DEATH RAILWAY

During World War II, more than 50,000 British, Australian, Dutch, and American prisoners of war (POWs) were forced by their Japanese captors to build railway lines that would effectively link Burma and Thailand to other Japanese-held areas and facilitate a Japanese invasion of India. A similar scheme for a Burma-Thailand railway had been abandoned by the British earlier in the century because of the sheer difficulty in negotiating the rugged mountainous, disease-ridden jungle terrain. Pressed by logistical difficulties and the Allied submarines that were hampering efforts to supply troops at the front, the Japanese determined in 1942 to build the railway using forced labor. An estimated 25 percent of POWs died because of overwork, disease, malnutrition, and other factors. While these death rates are appalling, the toll on the forced Asian laborers was even higher. Out of an estimated 250,000 Asian laborers on the railway, perhaps as many as 100,000 or more died. The construction of the Death Railway, as it came to be called, was one of the acts highlighted through prosecution at the war crimes trials following World War II.

—Gerrit Dirkmaat

expansion of rail lines had a dramatic impact worldwide.

Although some important railroad expansion still occurred in the United States—such as the new Santa Fe rail line built in 1907 from San Diego, California, to Yuma, Arizona, that broke the Southern Pacific Company's monopoly—this period represented an explosion in the use of existing rails for commuting purposes. Major cities such as Chicago, Boston, New York City, and Philadelphia expanded their capacity in order to meet the rising demands of their rapidly growing suburban areas. By 1920 in the Boston area alone, nearly 250,000 commuters were riding the rails every day. In New York where commuter rails were slower to develop, commuters on rails increased from 14.5 million in 1913 to 33.5 million in 1929. Most cities adopted electrical lines for their commuter trains in the early decades of the twentieth century. However, as quickly as the railroad grew as a commuter transport, it began to just as rapidly decline in importance following its peak in 1929. By 1940 with the rise of the automobile, commuter rail traffic in the United States had been cut almost in half.

In Europe the strategic aspects of railways were essential during World War I. Although railways had been used by the Germans to win the Franco-Prussian War (1870–1871) and to an even greater extent in Africa by the British in their prosecution of the Boer War (1899–1902), World War I far surpassed any previous conflict in its utilization of railways for military purposes. Railways allowed armies to mobilize and reach the front in weeks rather than months. Many historians argue that the very existence of the railways facilitated the outbreak of hostilities at the outset of the war. Because mobilization was placed on a much more rigid and rapid timetable based on the usage of rolling stock, it was both difficult and imprudent to stop once it had begun, lest the resulting snarled transportation network left one's army disjointed and paralyzed if an enemy nation did in fact attack.

Throughout the war men and matériel were rapidly moved to the battlefield, and smaller branch lines were constructed to serve the evolving needs of the battlefield. Massive artillery pieces, such as the German Big Bertha, were

mounted on railcars to expedite their movement. Russia, whose lack of effective rail connections to the Far East had at least partially caused that nation's crushing defeat at the hands of the Japanese in 1905 during the Russo-Japanese War, had invested much in the way of railway construction and modernization and utilized these improvements to quickly move thousands of men to the front.

In the late interwar years, rail transport began to lose ground to other methods, namely airplanes and automobiles. The turn against railroads in this period was evident in the British efforts, or lack thereof, to build railways throughout their sphere of influence in the Middle East and Southeast Asia. While many plans were put forward, most were discarded in the face of prohibitive costs, difficult construction, and viable alternatives.

Despite the fact that railways were declining in relative significance economically and militarily, World War II greatly increased the need for locomotives, rolling stock, and new rail lines. On the Russian front, Germans undertook massive rail building and conversion efforts, as they were forced to contend not only with the scorched-earth policy of the Soviet Army that wrecked locomotives, tore up rail lines, and demolished railway bridges but also with the fact that the Russian rail gauge was a different size than the German lines. This necessitated a painstaking regauging process, first by the Germans in their advance and second by the Russians as they retook the lost rail lines later in the war. The Russians also built more than 4,000 miles (7,000 kilometers) of new track during the conflict. In Nazi-occupied Europe, railways were a major accomplice to genocide, as Jews were herded into train cars and taken to concentration and death camps. Allied strategists have been criticized for failing to target for bombing the rail lines to death camps such as Auschwitz.

Following World War II, the brief resurgence in rail traffic ended, and rail traffic steadily declined as automobiles and trucks proved more effective and flexible for the economic needs of the booming postwar economy.

Petroleum

Between 1900 and 1945 petroleum changed from a minor source of power to a major one. The primary reason for this transformation was the use of petroleum in the form of gasoline and diesel to power new modes of transportation that utilized the combustion engine, including automobiles, trucks, airplanes, and ships. These new modes of transportation affected all facets of social, economic, and cultural life, and the demand for petroleum altered the geopolitical climate.

From earliest recorded history humans utilized shallow pools of crude petroleum that rose to the surface as a lubricant, a source of lighting, and even medicine. But in 1859 the Drake well in Titusville, Pennsylvania, was the first successful attempt to drill into subterranean pools of petroleum. From 1859 until 1913, most of the petroleum was distilled into kerosene to provide fuel to light private homes. After the invention of the incandescent light bulb in 1879, electricity rapidly replaced kerosene lamps as a lighting source in the early twentieth century.

The development of the automobile in the late nineteenth and early twentieth centuries created an additional demand for petroleum. At first, gasoline was only one option to power automobiles; several engine designs used steam or electric motors. Neither steam nor electricity, however, could provide the power necessary in the United States to travel vast distances or across rugged rural roads. Henry Ford's production of the Model T, first begun in 1908, marked the emergence of the mass market for automobiles.

> VENEZUELAN OIL

Long before the arrival of the Europeans, the native inhabitants of Venezuela knew that their land contained petroleum deposits. Natural seepages of crude petroleum had been occurring around Lake Maracaibo for centuries, with the indigenous people using the black crude to caulk and repair their canoes. Although the Compañía Petrolera del Táchira (Táchira Petroleum Company) began production in the Venezuelan Andes in 1879, such operations were limited and primitive. The company produced only about 40 gallons of petroleum a day, achieved by manually digging pits and scooping the petroleum out with buckets. The first commercial oil well in Venezuela, Zumaque 1, was drilled in February 1914. By 1917, the first year that Venezuela exported petroleum, the industry was producing only about 125,000 barrels a year. Thus by the end of World War I, Venezuela had not yet become a major supplier of petroleum. By 1928, however, Venezuela was producing around 100,000,000 barrels a year, more than any other country in the world.

—H. Micheal Tarver

Over the course of two decades, Ford continued to manufacture the Model T at a declining cost to the consumer, turning the automobile from a toy of the rich to a staple of American life. By 1913 the United States claimed 485,000 of the 606,000 cars worldwide. In 1913 as automobiles created greater demand for petroleum, William Burton developed the process of thermal cracking. Using high heat to break down the carbon molecules, thermal cracking proved more efficient than distillation and allowed for the production of more gasoline from the same amount of crude. In addition, petroleum provided lubricants necessary to the automobile and to manufacturing equipment. Petroleum also provided the material to build the roads that the new cars traveled over. By 1907 the use of asphalt for road construction exceeded the use of natural materials. The road networks of North America and Europe grew exponentially, and during the 1920s and 1930s asphalt roads replaced older stone roadbeds in urban areas.

Military vehicles and railroads also stimulated reliance on petroleum. During the Boer War (1899–1902) the British made extensive use of gasoline-powered trucks for the first time in military history. For the navy, oil appealed to admirals such as Britain's John Fisher because it gave the fleet increased range, greater carrying capacity, and more speed. No longer would fleets be limited in range to the vicinity of their coaling stations.

In the years prior to World War I, several European nations and the United States began shifting from the use of coal-powered steam locomotives to diesel engines that had greater power and carrying capacity. By the end of World War II, most railroads in Europe and North America were diesel powered.

During the 1920s demand for private and commercial transportation increased the sales of both cars and trucks. To provide gasoline, service stations became a standard fixture of the roadways. New pumps were designed to fill the increased gas tanks. Prior to 1923 automobile engines tended to run very rough. The introduction of ethyl (leaded) gasoline dramatically improved engine performance although at a great expense to the environment. As Henry Ford had revolutionized the automobile industry in the 1910s, Alfred Sloan did so in the 1920s when General Motors introduced the annual model change. In so doing, Sloan removed the car from the sole realm of transportation and made it an item of consumption, style, and self-expression. Furthermore, in urban areas gasoline-powered buses replaced electric trolleys as the main source of public transportation.

In the 1920s gasoline-powered airplanes competed with airships (dirigibles and blimps) for long-distance commercial service. Charles Lindbergh and Amelia Earhart, among hundreds of barnstorming daredevils, glamorized the possibilities of airplanes. In the 1930s, new wing designs and building materials dramatically improved airplane capacity and distance. The *Hindenburg* disaster in 1937 sealed the fate of airships and guaranteed the supremacy of the gasoline-powered aircraft.

As demand for oil increased, scientists and geologists developed new technologies to locate

potential petroleum fields and extract oil from deeper wells. Aerial photography, seismography, and improved understanding of geological requirements for petroleum deposits allowed companies to identify potential oil fields. Improved rigs and drills increased access to deep oil reservoirs. In 1918 the best rigs could drill to a depth of 6,000 feet (1,800 meters), and by 1930 they could reach 10,000 feet (3,000 meters). In 1900 the United States and Russia were the leading petroleum extractor nations. Between 1900 and 1945 new fields were opened in North, Central, and South America; the Middle East; Southeast Asia; Russia; and Romania.

During World War II, oil played a tremendous role. Oil served as fuel for tanks, planes, ships, and trucks and served as a raw material for explosives, runways, roads, and synthetic rubber. A lack of petroleum forced the Axis nations of Germany and Japan to seek synthetic sources of fuel. By 1944 synthetic oil accounted for 57 percent of the German total supply. Following World War II the importance of petroleum as a source of energy increased as automobiles and airplanes became more common forms of transportation throughout the world.

The Economics of European Travel

Modern tourism originated in Europe as a result of the eighteenth-century Grand Tour, a coming-of-age ritual that drew wealthy young Englishmen, and a few women, to the continent for a stay of several months to a few years. Parents expected young tourists to master languages, de-

velop more sophisticated aesthetic sensibilities, and acquaint themselves with various European cultures. Tourists spent liberally, traveled with mountains of luggage, purchased art, and spent lavishly on alcohol, prostitutes, and accommodations. When visitors wrote about their experiences, more and more readers dreamed of making similar trips.

Two factors were particularly important to the dramatic growth of tourism after the middle of the nineteenth century. First, transportation options grew and became more affordable. By the 1880s, European railway companies offered express trains to particularly popular destinations such as the French and Italian Riviera, the Atlantic coast, and the Alps. Travelers could move from the French Channel ports to Cannes or Nice in under 24 hours. The addition of expanded steamboat service by the fin-de-siècle further expanded travel options and efficiency. Likewise airline travel, first for the wealthy after World War I and then for a growing segment of the middle and working classes after World War II, further increased the availability of holidays for both Europeans and non-Europeans alike.

The extension of available leisure time further expanded the popularity and importance of tourism. During the early nineteenth century most workers enjoyed almost no free time and therefore could not contemplate holidays. Gradually, agitation by workers' groups and unions prompted a half a day Sunday, free Sunday, and eventually the growth of weekends. Many workers earned unpaid summer holidays by the last two decades of the nineteenth century. After World War I many British employers awarded their workers with paid holidays; the government extended this benefit to all workers in 1938 by passing the Holidays with Pay Act. Similarly, in Germany workers gradually earned greater and greater free time, moving from an 80- or 90-hour week during the nineteenth century to a 50-hour week by World War I and a 40-hour week in 1975.

State-sponsored tourism development remained rare during the first years of the twentieth century. The Spanish government was among the first to include tourism development in the state's agenda for economic growth. The program strove to attract tourists from foreign

IRISH TOURISM

During the nineteenth century tourist traveling to Ireland increased, especially after an English entrepreneur launched a private tourism development association to promote the importance of tourism development. Irish tourism suffered greatly due to the Anglo-Irish War (1919–1921) and then the Irish Civil War (1922–1923), but after a group of mostly Irish entrepreneurs launched the Irish Tourist Association (ITA) in 1924, tourism development started in earnest. The Irish government established the first official tourist board in 1939 following pressure from the ITA. Following World War II the government again increased both interest and investment in tourism by creating a succession of new tourism bodies. Even to date, Irish tourism benefits from the picture-postcard appearance of many Irish towns.

—Eric G. E. Zuelow

markets such as Britain and France. Various European officials and journalists soon noted that tourism was a growing part of the French, Spanish, Swiss, and Italian economies, and patriots such as Spaniard Marqués de la Vega-Inclán presented tourism as an important national interest. By the eve of World War I nationalists in many European countries believed tourism to be an important national interest. Thus, private pressure groups urged their state governments to expand tourism initiatives.

During the interwar period several state governments, including France, Germany, Italy, and Ireland, formally instituted tourism development programs. Spanish dictator Miguel Primo de Rivera pursued the development of infrastructural improvements such as roadway development and maintained a belief that tourism would become a vital moneymaker for the nation. Likewise, in Ireland the Irish Tourist Association (ITA) pursued private development projects while applying constant pressure to the Irish Free State government. In 1938–1939 the ITA finally convinced the government to create one of Europe's first statutory tourist development bodies. The fascist regimes in both Italy and Germany pursued tourism as a significant component of state-

regenerative policies. Leisure organizations such as the Nazi's Kraft durch Freude strove to create both a tourism infrastructure and affordable vacation opportunities for workers, spawning both economic growth and loyalty to the regime.

World War II brought European tourism development to a grinding halt, while total war destroyed much of Europe's tourism infrastructure. Even in Ireland, which remained neutral during the war, tourism development as well as tourist traffic slowed to a crawl, while tourism revenue all but vanished.

During post-World War II reconstruction, the Marshall Plan encouraged European states to further expand official tourism efforts. In Ireland, for example, U.S. officials working to implement the plan threatened to revoke agricultural grants unless Irish officials reconsidered state tourism policy. Indeed, tourism development made sound economic sense because the market for tourism certainly did not vanish as a result of the war. In fact, in the immediate aftermath of V-E Day, tourists rushed to Ireland partly because the country had avoided the destruction inflicted on British and European cities and partly because it was virtually the only place in Europe where fresh meat and dairy products were easily available to visitors during a period of otherwise widespread rationing. By the 1950s Europe far exceeded other world tourist destinations. In 1950, for example, European states together earned \$490 million from tourism, ahead of the \$366 million earned by the United States and the \$215 million collectively earned by Latin American countries.

Politics and Statecraft

On November 9, 1923, a group of German nationalists attempted to launch a rebellion against the Weimar Republic from a beer hall in Munich. They believed that they would be joined by the local citizenry, but local authorities swiftly ended the uprising. Although they failed, many Germans shared their frustrations with the Weimar Republic, believing that the government was constituted by the “socialists and Jews” who had betrayed Germany and caused it to lose the war in 1918. The uprising’s leader, Adolf Hitler, was arrested and tried for treason by German authorities. With Hitler in prison, the National Socialist Workers Party of Germany (Nazi for short) faded from public consciousness. However, by January 30, 1933, Hitler would reemerge triumphant as the leader of this political party and become chancellor of Germany, still preaching the same rhetoric against the Weimar Republic that he uttered at what became known as the Beer Hall Putsch of 1923. As such, National Socialism emerged out of the aftermath of World War I, when ideologies like nationalism, anti-Semitism, imperialism, and socialism had a significant influence on national politics in many parts of the world. Such authoritarian movements developed across the world in reaction to the postwar settlement of World War I and were further spurred by the development of economic instability even before the great global economic depression of the 1930s. These authoritarian movements radically changed the political landscape of the world as well as the statecraft of individual nation-states, all of which sought to revise or preserve the existing power relations within and between states during the interwar period.

From 1900 to 1945 two world wars—and an interwar global economic collapse—led to ideological shifts and major changes to political systems worldwide. The disintegration of European hegemony shaped much of this period. Western Europe’s aura of invincibility disappeared in the aftermath of World War I. While Britain and France were able to maintain some stability in the interwar period, Germany, Italy, Spain, and Russia, among others, were drastically altered by revolutionary ideological movements. At the same time, in world regions under European direct or indirect rule, nationalist sentiment and resentment against colonialism led to the emergence of independence movements. The Boxer Rebellion (1899–1901) was a precursor of these developments as Chinese rebels sought to drive foreigners from China. Nationalist movements

The Boxer Rebellion (1899–1901) was a precursor of these developments as Chinese rebels sought to drive foreigners from China. Nationalist movements also increased in fervor in southern Asia as leaders such as Mahatma Ghandi organized Indian resistance to British rule.

also increased in fervor in southern Asia as leaders such as Mahatma Ghandi organized Indian resistance to British rule.

European investments had a wide impact even in areas where Europeans were not clearly hegemonic. For instance, about one-third of the capital in Russian companies was owned by foreign investors, primarily the British, French, and Germans. Russia, Mexico, and China underwent political and economic revolutions. The common goal of these revolutions was to eliminate external economic influence as well as the internal political control of elites who collaborated with foreign interests. Rebels in these states shared the goal of modernization and economic autonomy. New authoritarian states also came to power in this era not only in Russia but also in Germany, Italy, and Japan. With the unleashing of World War II, the authoritarian yet revolutionary political movements that ruled in the Axis nation-states of Germany, Italy, and Japan sought to destroy the international order established by Britain and France (and the United States) during the interwar period and to redraw the global map under shared Axis dominance.

Before World War I the European Great Powers, the United States, and Japan had launched various colonial ventures, creating expansive empires and territorial rule. Nonetheless, vast political changes reshaped developments at home and in their respective colonial domains. In Europe the multiethnic central European empires faced the growth of nationalist fervor within their minority populations. Britain and France, while both possessing republican governments, were confronted by large electorates seeking to ensure social and economic gains at the expense of landed wealth and the industrial class whose influence was being challenged. In the Americas, greater demands for political representation and economic opportunity extended from the United States to Argentina. Moreover, European women had been slowly gaining the right to vote in some areas since the mid-nineteenth century, attaining at first political and then greater social and economic autonomy. The working classes, many but not all of whom were influenced by socialist ideology, also sought greater changes, such as political power, higher wages, and better working conditions.

World War I and the Great Depression further destabilized the delicate political landscape in Europe, unleashing the forces lying below the surface. The institution of monarchy unraveled in major dynastic European states with the war, as the Hohenzollerns in Germany, the Habsburgs in Austria-Hungary, and the Romanovs in Russia were removed from power in their respective states, much as the Qing dynasty in China had been prior to the conflict. Socialism, fascism, and other forms of authoritarian political systems seemed viable ideological systems to replace “bourgeois” liberalism, which had failed to prevent the war. Some came to believe that elites had pursued the war for the alleged benefit of a small class of individuals. In theory the Treaty of Versailles was intended to establish new borders in Europe, following the doctrine of national self-determination, and aimed to create ethnically homogenous nation-states in central Europe. In practice, however, Germany, Italy, Hungary, and others immediately contested the new borders, increasing rather than alleviating tensions in the area.

The political uncertainty of the era, exacerbated by economic stresses and combined with the disgrace of being defeated in war, stimulated a radical new political outlook—fascism—first in Italy and then in Germany. As it developed fascism became a form of extreme nationalism, with a goal of promoting resistance to threats of decadence, particularly racial and cultural “pollution.” The element of ultranationalism was promoted in both states but particularly in Germany, which framed defeats, humiliation, and losses as the result of subversive attacks by impure elements from within. Italians were somewhat resistant to the racial messages, but German Romanticism—the idealization of mythical tribal ancestors—made Germans particularly susceptible to the message. Ravaged by the depression, burdened with the requirement for reparations (payment of fines for damages in World War I), and frustrated by unresolved issues left over from the war, Germans were willing to recast traditional institutional folkways along a reactionary modernist framework, emphasizing national unity and an aggressive foreign policy and ultimately leading to the invasion of Poland and World War II. Italy and Germany were not alone in their desire for strong, decisive leadership. Authoritarian dictatorships such as that established by Francisco Franco in Spain after the Spanish Civil War (1936–1939), while assuming the trappings of fascism, did not seek to establish racist ideologies as state policy, being inclined to restore the power of traditional elites and institutions.

The extreme nationalism expressed by fascist movements was in direct opposition to the extremely internationalist socialist movements of the day. Although there had been European precursors, Marxist socialism was born of the excesses of industrialization. Workers began organizing across Europe seeking to end abusive working conditions; communist ideology held the promise of a more egalitarian society with a fair distribution of wealth. The Russian Revolution, which established the first viable Marxist state in the former tsarist Russian empire, set a precedent for the working classes of the world. As World War I and the Russian Civil War ravaged and depleted the Russian countryside, the Bolsheviks sought to create, primarily through coercion, a socialist state administered by a small clique of communist leaders. On the opposite political extreme, Social Democracy (encapsulated in the Social Democratic Party, which established the liberal Weimar Republic), particularly in Germany, and the Popular Fronts of Spain and France sought a more conciliatory strategy to work within their respective republican systems of government while expanding their welfare states for the benefit of the masses and resisting fascist encroachment. In this context, a milder form of socialism would be established gradually through cooperation among socialists, liberals, and republicans within the existing constitutional framework of government.

As authoritarian movements came to power, however, voting rights vanished. This ensured that their leadership could not be challenged.

Authoritarian dictatorships such as that established by Francisco Franco in Spain after the Spanish Civil War (1936–1939), while assuming the trappings of fascism, did not seek to establish racist ideologies as state policy, being inclined to restore the power of traditional elites and institutions.

Authoritarian leaders insisted that they needed such power to effectively meet national emergencies, most notably the Great Depression. Germans voted into power the National Socialists to avenge the humiliations enacted by the Treaty of Versailles. Once in power, the Nazis implemented expansionist plans that led to the outbreak of World War II in Europe in 1939. In this context, National Socialism and Stalinism, while diametrically opposed, managed to muster and mobilize their respective national economies and populations for total war. Both movements inspired men, women, and children in the tens of millions to fight and die for their ideological tenets and the restoration of national greatness while demonizing the “other”: enemies both foreign and internal. In this manner, authoritarian regimes in Japan, Italy, Germany, Romania, Hungary, Austria, and Bulgaria eliminated democratic institutions.

In contrast the United States, under the New Deal of the 1930s, had found a way to maintain political liberalism by extending the powers of the federal government to coordinate the national economy and ameliorate the worst effects of the global depression, all for the benefit of its national population but at the expense of economic liberalism. President Franklin D. Roosevelt had established a valuable precedent that would serve the country well when it entered the war in 1941, when the federal government, in tandem with big business, would coordinate the economic mobilization of the nation’s resources and labor in order to fight on two global fronts. Similarly, governments in Britain, Australia, and Canada expanded the role of the state in the daily lives of the citizens. Britain in particular instituted the cradle-to-grave welfare state after the end of the war to address the needs of its populace, building on precedents of state-interventionism during the war, a model subsequently followed by other European and British commonwealth states.

In 1900 much of the world was under direct or indirect control by the European Great Powers (the Americas, while nominally politically independent, were nonetheless tied to European political and economic control). Nationalism, which had shaped European political movements in the nineteenth century, grew as a reaction against imperialism in much of the non-European regions of the world, drastically affecting the political cultures of people already resentful of European dominance. Resentment against European and U.S. interference led to the development of fervent nationalist movements. World War I ended with a promise of greater egalitarianism in global politics for the colonial world. U.S. president Woodrow Wilson announced this in the principle of national self-determination; however, this ideal was almost immediately shattered, as its premise was only extended to white Europeans. Despite its gains, Japan felt slighted that its territorial acquisitions did not correspond to its efforts. From the perspective of colonized nations, the newly established League of Nations served the interests of the European Great Powers and their efforts to retain their empires and annex the territories of the defeated Central Powers. The former Arab provinces of the Ottoman empire, for example, were seized as League of Nation “mandates” by Britain and France.

Economic collapse and the consequences of war, radiating out of Europe and eastern Asia, drastically shaped world regions and aspirations. Nationalist leaders in British India, Dutch Indonesia, and French Indochina at first shared a common cause with the Japanese ambition to drive the Europeans out of eastern Asia and the Pacific. In the same manner, nationalists in the Middle East and eastern Europe viewed Nazi Germany as a harbinger of freedom for their respective independence movements. Nationalist rhetoric to the contrary, Japan and Germany ultimately regarded such nations as only worthy of conquest and eventual subordination to either the Third Reich or the Greater East Asia Co-Prosperity Sphere. Nevertheless, such nascent political alignments are indicative of the resentment directed against European colonialism.

Political revolutions in Mexico and China attempted to eliminate Western economic dominance by overthrowing national elites and dismantling institutions that catered to foreign interests. In China, the May 4th Movement was a direct reaction to Japan gaining control of previously German-held Chinese lands through the Treaty of Versailles, despite China's labor contributions in World War I. Nationalist movements in sub-Saharan Africa, the Middle East, and Asia were shaped by developments in Europe and Japan, as their residents fought with their respective colonial authorities hoping for increased economic and political gains after World War I. Millions of colonial subjects fought for Britain and France in Europe, northern Africa, eastern Asia, and the Pacific alongside European regulars. Anticolonialism returned as a key force following World War II when independence movements gathered momentum and dozens of new states developed on former colonial holdings.

and Abraham O. Mendoza*

■ Introduction: Imperialism

During the first half of the twentieth century, imperialism reached its pinnacle before entering a steep decline. While European nations accounted for the majority of empires, the United States and Japan were also actively expanding at this time. Although there were several factors that contributed to imperialism, the more significant ones included economics, industrialism, and scientific racism. The imperial powers shared methods as well as motivations; violence defined diplomatic relations between the empires and their subject colonies. The older European empires, such as those of Britain and France, were already in decline at the

turn of the century, while newer imperial nations, such as Germany, actively conquered new lands, primarily in sub-Saharan Africa and Asia.

Economic expansion and exploitation motivated most imperial expansion. As the European nations, the United States, and Japan further industrialized, each sought new markets to control and new resources to fuel industrial output. Underdeveloped countries were often politically divided, militarily unprepared, and economically impotent compared to industrialized nations. Powerful nations colonized weaker ones through military and economic force as well as through convoluted diplomacy that

exploited the ignorance of the native populations. Once the imperialists were firmly entrenched as the dominant political power in an area, they coerced natives to labor for the benefit of the empire by extracting valuable natural resources. History has shown that King Leopold II of Belgium was among the worst offenders in this sense.

Culture was likewise forced upon native populations. Scientific racism attempted to explain the dominance of Western civilization through faulty interpretations of Darwinian science and Christian ideals. This belief justified and promoted the subjugation and forced acculturation of nonwhite populations as beneficial to the barbarous non-Europeans. In actuality, the cultural aspects and religious teachings most often disseminated were those stressing loyalty, obedience, and similar values in order to reinforce the imperial relationship as natural and holy. Within the British empire some of these cultural goals became reality. Canada and Australia enjoyed virtual autonomy as dominions with white majorities, while in India Mahatma Gandhi became motivated by British political ideals and worked toward achieving India's independence. Imperial Japan was exceptional only because it was not a Western nation; it too used violence as a means of securing colonies in Asia, sought colonies whose natural resources it could exploit, and forced Japanese culture in its colonies.

The cumulative effects of World War II changed society on virtually every level, thus effectively ending imperialism. Empires became too costly, and nationalism receded. Belief in the supremacy of European civilization ended, while at the same time Japan became a defeated nation through war.

Imperialism in the early twentieth century had been the product of extreme nationalism, economic competition, and international prestige. Industrialized nations exploited nonindustrialized nations for their natural resources. Scientific racism justified colonization and allowed greed to overpower altruistic goals. By 1945, World War II had explicitly demonstrated the potential for abuse and the repercussions of unchecked imperialistic motivations, thus destroying much of the desire for empire. The aftermath of the war changed the political, cul-

tural, and philosophical landscape of the globe, rendering such exploitative empires archaic.

—*Ian Patterson*

Imperialism in East Asia

Between 1900 and 1945, imperialism in East Asia changed from British economic domination in China to Japanese conquest of the region. In 1900, foreign powers had wide-ranging legal rights, territorial possessions, and financial investments in China. Protecting these interests prompted a multinational force to put down the Boxer Uprising (1900) in order to preserve the weak Qing dynasty, whose collapse might have jeopardized imperialist positions in China. During this same time Japan was a rising power in the region, having defeated China, gained control of Korea, and annexed Taiwan following the Sino-Japanese War of 1894–1895. By the beginning of World War II, Japan had vastly expanded its presence in China and displaced Britain as the foremost imperialist power in East Asia.

Britain, France, Germany, Russia, and the United States all had a significant imperial presence in China in 1900, but Japan would be able to expand its East Asian empire at the very time that two world wars made the cost of overseas empire building less tenable for European powers. Through victory in the Russo-Japanese War of 1904–1905, Japan gained Russian concessions in northeastern China (Manchuria). In 1910, Japan formally annexed Korea after 15 years of less formal control. Although World War I initially took some Western imperialist pressure off China because European attention was focused elsewhere, Japan turned this opening to its advantage.

In 1914, under a 1902 Anglo-Japanese treaty, Japan entered World War I on the Allied side by seizing German-held territories in China. The following year Japan issued the Twenty-One Demands, forcing China to grant the island nation still more privileges. Although China had supported the Allied war effort by sending over 100,000 Chinese laborers to assist behind the lines in Europe, the ensuing Treaty of Versailles

did not reward China. Although the treaty stripped Germany of its East Asian colonies, instead of returning them to China the treaty formally granted them to Japan. Thus, between 1895 and 1919 Japanese imperialist control had extended up the Korean peninsula, into north-eastern China, and down into coastal China.

In 1922, the United States, China, Japan, France, Great Britain, Italy, Belgium, the Netherlands, and Portugal signed the Nine-Power Treaty, designed to ease imperialist pressures and give China a chance to build an effective central government. The treaty was a tacit admission that imperialism had made a weak China even weaker. However, the emergence of a strong centralized government in China by 1928 prompted concern in Japan that the large republic might soon be able to overthrow imperialism; thus, a new wave of Japanese expansionism ensued, with clashes between Chinese and Japanese forces. In the Mukden Incident of 1931, officers of Japan's Kwantung Army staged what looked like a Chinese attack on Japanese installations to rally more support in Japan for the Kwantung Army's expansionist plans.

With Japan's all-out invasion of China in 1937, much of eastern China came under Japanese control, which Japan administered through several collaborationist governments. In January 1943, the puppet regime in Nanjing signed an agreement with Japan to eliminate extraterritoriality and return the foreign concessions to Chinese control. The United States and Britain signed similar agreements with Jiang Jieshi (Chiang Kai-shek) later that year. Japan's surrender in 1945 and the changed circumstances of the Western imperialist powers following World War II restored Chinese sovereignty to nearly all historically Chinese territories.

COMFORT WOMEN IN WORLD WAR II

After reports of Japanese troops raping Chinese women early on during World War II, the Japanese military decided to provide their troops with women. The hope was that if the troops had ready access to sex, assaults against the general population would diminish. Initially, the army transported Japanese and Korean prostitutes to China for the purpose. But as the army took over more territory in East and Southeast Asia, the demand exceeded the supply of prostitutes. The result was widespread forced prostitution. Most of the comfort women were poor and Korean, and many of them were captured during slave raids. By the end of World War II, an estimated 100,000 to 200,000 young women had been turned into comfort women. The story only received widespread attention once three former Korean comfort women took legal action in 1991.

Imperialism in Western Europe

The half century between 1900 and 1945 marks an ambiguous phase in the history of West European imperialism. On the one hand, the general characteristics of the period were the absence of major colonial crises and the normalization and bureaucratization of colonial relationships. The frenzied imperial scramble, which began in the 1870s, had all but come to an end by the turn of the century. Colonial policy increasingly shifted from territorial expansion and military conquest to administrative consolidation and economic penetration. Furthermore, the relatively widespread euphoria that had accompanied the imperial scramble in metropolitan Europe gave way to a more sober assessment of the advantages

► THE MANDATE SYSTEM OF THE LEAGUE OF NATIONS

At the end of World War I, colonial interest groups in the British empire and in France coveted as war booty the colonies of defeated Germany as well as the Middle Eastern provinces of the disintegrated Ottoman empire. Yet these interests collided with the antiannexationist and anticolonial ethos of the United States under the leadership of Woodrow Wilson, whose economic strength and ultimate military decisiveness gave the president considerable clout at the Paris Peace Conference. When the negotiations almost appeared to falter in the face of this conflict of interests, the idea of mandates, first developed by South African prime minister Jan-Christian Smuts, developed as a compromise formula. According to Article 22 of the Covenant of the League of Nations, mandates were defined as territories formerly ruled by Germany or the Ottoman empire “which are inhabited by peoples not yet able to stand by themselves under the strenuous conditions of the modern world.” They would, for the time being, be placed under the “tutelage”

of “advanced nations,” with the eventual goal of independence. The former German colonies were divided among Britain, France, South Africa, Japan, Australia, and New Zealand; the erstwhile Ottoman provinces were divided between Britain and France. The mandatory powers had to provide annual reports to the League of Nations about the progress achieved. Furthermore, unlike “regular” colonies, mandates should be open to trade to every member of the League of Nations. Most academic and political commentators on the mandate system during the interwar years remained skeptical about its efficacy, and some regarded it as nothing but an elaborate smoke-screen to veil “old-fashioned” colonial expansionism. However, it nevertheless created an unprecedented degree of international accountability and transparency in global imperialism. It also, for the first time, set certain, albeit often limited, standards of “good” colonial governance.

—Daniel Becker

and disadvantages of colonialism among elites and to a general loss of interest in colonial affairs among the broader strata of society. On the other hand, the first half of the twentieth century also saw the emergence of an international debate about the goals, methods, and ultimately the very legitimacy of colonialism that must, in retrospect at least, appear as a crucial element in the unraveling of imperialism after World War II. It gave birth to both the major classics of European anti-imperialist criticism—such as the theories of, among others, John Atkinson Hobson, Vladimir Lenin, and Joseph Schumpeter—and to some of the precursors of contemporary postcolonial criticism (e.g., the cultural-political thought of Mahatma Gandhi or of the *négritude* movement). It also aided in the formation of an often Western-educated nationalist elite in the colonies who would become the political leadership of the Third World during the decolonization era in the 1950s and 1960s.

In this interplay of imperialist and anti-imperialist tendencies, World War I proved a watershed moment. The global conflict was not primarily fought over the colonies, but it was very

much fought with them. France and Britain in particular relied heavily on the additional manpower their empires provided to sustain their military operations. Soldiers from North and West Africa and from India and Canada fought against Germany in the trenches of northern France; Indians, Australians, and New Zealanders made up a significant part of the British forces launched against the Ottoman empire in the Middle East. The imperial powers consequently had to acknowledge that their empires’ service to their European concerns would have to be rewarded with concessions once the war ended. On another plane, Germany’s ultimately unsuccessful attempts to infiltrate enemy colonies and weaken them by inciting unrest and rebellion—unrealistic as they may seem in retrospect—forced the British and French governments to make relatively explicit promises of future improvements, even if these promises often remained vague and bound to open-ended conditions and timetables. The war rhetoric employed against Germany in the international battle over hearts and minds, replete with ideas of national self-determination and the advancement of democracy, slowly devel-

oped a dynamic of its own that the European imperial powers found difficult to contain or control after hostilities had ceased.

In the 1920s and 1930s then, the colonial administrations found themselves entangled in a web of promises and expectations, which they could often ill afford to fulfill because World War I had left Europe politically, economically, and psychologically exhausted. The structure of the international system in the interwar years only exacerbated their dilemma. The creation of the mandate system of the League of Nations introduced a certain degree of international oversight into European imperialism, even in territories that did not legally fall under the purview of the league. Moreover, the mere existence of several colonial powers-in-waiting—especially Germany (deprived of its former colonies at the end of the war), Italy (disappointed in its share of the spoils of war), and Japan (increasingly expanding in East Asia)—as well as of two emerging superpowers, albeit still somewhat isolationist, new, and officially anticolonial, the United States and the Soviet Union, ensured that imperialism would henceforth be judged in the court of international public opinion. Last but not least, colonial elites—often, though not always, Western-educated intellectuals and professionals—both in the colonies themselves and in the metropolitan centers were beginning to form political associations and other forums in which they could express their disaffection with colonial rule and, in some cases, openly advocate for its end.

The European colonial powers thus increasingly faced the problem of turning the legitimating rhetoric of an imperial civilizing mission into practical policy. Due to the general economic situation, they often had to solve it on a shoestring. For several reasons, Britain proved generally more successful in this endeavor than France or the other remaining imperial states. First, because it could afford to withdraw from immediate European political, economic, and security concerns, Britain could concentrate on its imperial affairs in ways that its erstwhile allies could not. Second, the traditional British system of colonial governance—now cast in terms of quasi-official philosophies of indirect rule and the dual mandate—lent itself better to the emerging international discourse on good colo-

nial practices than, for example, the French notion of assimilation (which, at any rate, France was at the same time abandoning for a seemingly cheaper and clearly more racist associationism). Finally, because the British empire was significantly larger and thus politically and economically more diverse than any of its counterparts, it was more amenable to sustaining its own economic and political development and consolidation. In addition, its experience with diversity within the empire enabled the British colonial elite to experiment with various forms of co-opting or accommodating potential critics without necessarily compromising the empire as such, as, for example, in the ultimately futile but initially promising attempts to deal with the Indian nationalist movement under Mahatma Gandhi and Jawaharlal Nehru, which stood in stark contrast to the often violent French attempts to address anticolonial opposition.

Overall, European imperialism between 1900 and 1945 was shaped by a relatively stable interdependency or equilibrium of forces of affirmation and forces of contestation. It was only during World War II that this balance began to unravel. The loss of control over significant parts of the various empires as a result of German conquests in Europe and of Japanese conquests in Asia strengthened anticolonial tendencies, which would then largely dominate imperial history after 1945.

Imperialism in the Soviet Union

Despite its ideological pronouncements of being inherently “anti-imperialist” and actively working against the forces of capitalism that utilized colonialism as a means to oppress peoples abroad and extract their wealth and labor, the Soviet Union also held imperial dominion over vast expanses of Eurasia. The Soviet Union covered a landmass that extended from the Baltic, Caspian, and Black seas on its western flank all the way to the Bering Sea and the Sea of Okhotsk to the east. Much like its predecessor, the tsarist empire of the Romanovs, the Soviet Union held dominion over most of northern Eurasia with the exception of the Baltic republics (until 1940) and Poland to the west, which were lost in the Treaty of Brest-Litovsk of 1918 and which the Bolsheviks failed to recapture at the end of the Russian Civil War in 1922.

Communist ideology negated the idea that the Soviet Union could be imperialist and insisted that nationality was an oppressive bourgeois construct. However, under V. I. Lenin and Josef Stalin, the Soviet Union (the Russian Socialist Federated Soviet Republic until 1922) through military force conquered the former territories of the Russian empire and forced ideological conformity through military, political, and economic means. More often than not, Soviet national identity was enforced as state policy relying on the Soviet police state apparatus. Despite the recognition of various “national” Soviet Socialist Republics (or SSRs), the official policy of the Soviet state was to create a uniform Soviet identity at the expense of the hundreds of nationalities across their Eurasian domains.

The Russian Civil War (1917–1923), which broke out in the midst of the Russian Revolution, led to the devolution of various parts of the former Russian empire, most notably Ukraine. Initially, myriad White forces faced the Red Army across the expanse of Eurasia; the defense of the revolution was the Bolshevik’s top priority. However, as the Red Army was able to reverse the gains of the Whites, the conquest of former tsarist territories became part of overall Soviet military strategy. While some of the White forces were in fact monarchists fighting against the Reds to restore

the tsarist regime or at least a noncommunist government, various segments of those fighting for the Whites were non-Russian nationalists seeking to dislodge themselves from what was seen as yet another colonizer, namely the Soviets. As the Red Army organized under Leon Trotsky, all Whites were lumped together as “reactionaries” seeking to destroy the revolution and collude with the external forces of capitalism. American, Japanese, and British forces indeed did attempt to prevent supplies from falling to the Red Army in various incursions during 1917–1922.

As territory was claimed, the Red Army forces were followed by Communist Party officials and the myriad organs of the police state, all seeking to establish stability, most often by removing the leadership and sending them to prisons farther inland and enforcing ideological conformity. The People’s Commissariat of Nationalities, established in 1917, sought to create viable solutions to the issue of nationalities; the goal was to nurture nationalist identities without encouraging separatism. The establishment of the various SSRs under the aegis of the Russian Socialist Federated Soviet Republic, which was officially an “equal” among other SSRs, established the imperial domination through the establishment of an ideological identity (Soviet) that negated national identity.

With the ascension of Stalin after Lenin’s death in 1924, Soviet imperialism was characterized by the effort to enforce ideological conformity throughout the vast expanse of the Soviet territories, usually by force. The goal was to unify the Soviet Union—composed of Muslim central Asia, the Arctic stretches of Siberia, the Russian Far East, and the Caucasus Mountains—despite its multicultural character. Stalin desired to establish ideological uniformity throughout these lands, albeit under Russian tutelage, via the establishment of different Soviet organizations and commissariats emphasizing Soviet unity across multiple nationalities. However, this Soviet identity was in fact heavily influenced by various Russian characteristics and values that often clashed with non-Russian cultural groups and their religious traditions. Moreover, during the economic policy of collectivization, which displaced hundreds of thousands of Soviet citizens from their farms, as well as the First and Second

Five-Year plans, which sought to industrialize the Soviet Union at an accelerated rate, various Soviet nationalities suffered tremendously at the hands of the police state apparatus. In the most obvious case, the population transfers that occurred before and during World War II of large numbers of Poles, Koreans, and Crimeans, among other nationalities, across the expanses of Eurasia, with many ending up in the Gulag prison network, also dislocated various national groups from their former homelands.

The Nazi-Soviet Pact of 1939, which included a secret protocol by which Nazi Germany and the Soviet Union divided swathes of eastern Europe, notably Poland, between each other is another flagrant case of Soviet imperialist expansion. Under this deal, the Soviet Union acquired Latvia, Lithuania, Estonia, and eastern Poland. Moreover, the “winter war” against Finland, fought for strategic points to confront Germany in an eventual conflict, also presented the Soviet Union as an aggressor seeking to expand westward after sharing spoils with its ideological enemy. However, this arrangement ended with the German attack on the Soviet Union in 1941. During World War II, the Soviet state emphasized Russian nationalism over other nationalities to maintain the cohesion of the state under Russian domination against the Axis. Therefore, during the war Soviet imperialism was manifested through the auspices of the Soviet party apparatus, the secret police, and the military. Despite the official line that the Soviet people were fighting the “Great Patriotic War” against the fascists, non-Russian nationalities found themselves at the whims of the Soviet police state, constantly under suspicion of seeking common cause with either German or Japanese forces. After the end of the war in 1945, hundreds of thousands of non-Russians (as well as Russian Red Army troops who had served in Europe) were accused of espionage or sabotage, which led to further population transfers and long prison terms in the Gulag.

Imperialism in South Asia

The British in South Asia ruled over a vast colony in population and geographical space that became the envy of the other powers during the apex of European imperialism. British rule was predicated upon a paternalistic assertion that the Indians were not mature enough yet to rule themselves. However, South Asians increasingly resisted a British rule that became more and more oppressive. When the British partitioned Bengal in 1905, Bengalis responded with a fierce Swadeshi (self-sufficiency) boycott, prompting a change of the capital from Calcutta to Delhi in 1911. At the same time, the growing strength of the Indian resistance to the British empire made British control over the most precious jewel in their crown increasingly tenuous. The moderate influence of the Indian National Congress (founded in 1885) and the religious nationalism of Swami Vivekananda yielded to the Extremist elements during the Swadeshi campaign of 1905–1908. In response, the British cracked down hard on the rise of extremists, such as Aurobindo Ghose and V. D. Savarkar. The former went on trial in 1908 and later into a permanent self-imposed internal exile in Pondicherry, while the latter was transported to imprisonment on the Andaman Islands.

Without prior consultation with the South Asian leaders, the British declared war for their South Asian colony in both World War I and World War II. During the wars, India provided a cornerstone of British global power, providing significant numbers of troops and tremendous wealth to the war efforts. As a consequence, Britain was deeply indebted to its South Asian colony.

During and after World War I, Britain was faced with increasing opposition to its rule, including the Ghadar (or Ghadr, meaning “revolution”) movement of Indians living outside South Asia. This movement became further fueled by the *Komagata Maru* incident in September 1914, when a ship with South Asian immigrants attempted to land in Vancouver, Canada, but was refused admission. The ship then went to India, where the British police jailed the passengers after a bloody clash. In 1915 the British successfully suppressed unrest within India through

➤ GEORGE NATHANIEL CURZON, FIRST MARQUESS CURZON OF KEDLESTON

Lord Curzon, Viceroy of India from 1899 to 1905, was a promising, eloquent, arrogant, important, and ultimately classically tragic figure. Ironically, the more he worked the more remote his goals of furthering British rule and helping the Indian population became. Although he never appointed an Indian to his Executive Council, Curzon did spend lavishly to preserve ancient Indian monuments such as Fatehpur Sikri and the gardens of the Taj Mahal in nearby Agra. His fund-raising also proved instrumental in the construction of the British answer to the Taj Mahal, the Victoria Memorial Hall in Calcutta. To the admiration of Indians, Curzon personally intervened to punish a British military unit, the Ninth Lancers, whose members had covered up their killing of an Indian cook. To protest Curzon's fairness, the English cheered loudest for this unit at the Coronation Durbar in 1903.

While Curzon did much to build up British prestige and power, ultimately his legacy was bitterly divisive and counterproductive for British rule. For the sake of administrative efficiency and dividing nationalists into Hindus and Muslims, he partitioned the capital province of Bengal. Announced in 1903 and carried through a month before Curzon left India in 1905, it sparked a vehemently hostile response among Indians, fueling the Indian independence movement.

—Douglas T. McGetchin

George Curzon, British Viceroy of India from 1899 to 1905.
(Library of Congress)

the Defence of India Act, suspending civil rights and extending martial law. By 1917, Annie Besant and Bal Gangadhar Tilak organized parallel Home Rule Leagues that agitated against British rule.

Failure to deliver on wartime promises and British general Reginald Dyer's massacre at Amritsar in 1919 fed Indian unrest, including Mahatma Gandhi's several Satyagraha (nonviolent resistance) campaigns, such as the Salt March in 1930. The British were successful, however, in stalling Indian aspirations by offering several inconsequential Round Table Conferences and including some Indian ministers under the diarchy scheme of the Montagu-Chelmsford reforms of 1919. Likewise, the Government of India Act (1935) brought more South Asians into the gov-

ernment, despite Winston Churchill's dismissal of Mahatma Gandhi as a "half-naked fakir."

The British extended their control of the subcontinent in part through their bestowing of favors and privileges upon special "martial races"—such as Ghurkhas, Sikhs, and Muslims—who played important roles in the Indian military, illustrating the larger British strategy of divide and conquer. This approach by the British was also used to fuel communal religious differences, such as providing a separate electorate for Muslims under the Muslim League.

During World War II, the British faced more serious opposition from the Quit India movement and the Azad Hind, the Indian National Army (INA). The INA, led by Netaji Subhas Chandra Bose, fought on the side of the Japanese in

Burma against Allied forces, including the British and Indian troops loyal to the British. Although viewed as traitors by many Indians, a postwar trial of INA soldiers in Delhi's Red Fort backfired against the British. The INA enjoyed widespread sympathy in India, and the prominent venue produced much press coverage.

The British lost control of South Asia because of mounting pressure by nationalists, a desire to reduce the enormous debt amassed from fighting World War II, and a British Labour government. The British withdrew rapidly in 1947 from their colonies in South Asia, leaving behind a hastily drawn border in Kashmir and shaky political settlement between India and Pakistan, leading immediately to 1 million refugee deaths and decades of animosity and violence. On the other hand, India remains the world's largest democracy based upon political traditions and civil liberties developed while struggling against a British rule that in practice often failed to live up to the ideals its Indian subjects aspired for it.

Direct Rule

In contrast to indirect rule, direct rule refers to a method of ruling a colony without relying on native elites and/or institutions but instead ruling through bureaucratic and military institutions imposed upon the indigenous populations. Although direct rule was pursued by several imperial powers to varying degrees when it was deemed necessary and in regions where indirect rule was viewed as impossible, in general the policy of direct rule was followed by Britain, France, Germany, Japan, and the United States from 1900 to 1945. Typically, direct rule was imposed when military authorities were unable or unwilling to allow native collaboration due to in-

digenous resistance or a prior state of war with the native population. Britain, an advocate of indirect rule particularly in British India, also had to set up colonial bureaucracies for ruling certain colonies that could not be ruled through native elites or institutions, such as Burma. Direct rule also had social Darwinist and racist underpinnings that expressed a condescending perspective, such as in the paternalistic French notion of *mission civilisatrice* (civilizing mission). Colonizers assumed that certain Asian and African peoples could not be ruled by themselves but instead needed European tutelage and assistance to carry on daily life.

As the European empires made headway in colonizing most of the world's regions following the scramble for Africa and expansion into Asia in the late nineteenth century, they found it expedient to develop indirectly ruled colonies by using native political elites and existing institutions. This allowed them to rule cheaply, maintaining a limited bureaucratic and military presence in such regions while benefiting through economic and strategic advantages garnered by colonization. However, as these empires found themselves confronted by resistance or what they deemed to be vastly "uncivilized" native populations, colonizers found that establishing direct rule would be far more practical for themselves and for the "good" of the indigenous population. In these instances, after quelling a rebellion or a large-scale war of resistance, colonial troops would occupy the colony and set up martial rule, with limited to no native collaboration.

In the early twentieth century, most of the directly ruled European empires had already been established. However, there were instances, such as the American occupation of the Philippines, the British conquest of Burma, and the Italian seizure of Ethiopia, in which direct rule was imposed over a native resistance movement unwilling to comply with foreign demands and seeking to maintain its sovereignty.

Following the end of the fighting between Spain and the United States in the Spanish-American War in 1898, Filipino resistance against U.S. rule ensued. The Filipino resistance against Spanish rule, under the leadership of Emilio Aguinaldo, had declared its independence from Spain toward the close of the Spanish-American War.

THE THIRD REICH—DIRECT AND INDIRECT GERMAN RULE

Within Nazi-occupied Europe before and during World War II, intra-European colonialism was imposed through means somewhat similar to those of European colonial practices overseas. German military administrators ruled directly over German-occupied provinces such as the Protectorate of Bohemia-Moravia (formerly Czechoslovakia) and the General Government (rump of Poland), both of which were seen as integral parts of the expanded German Reich. The General Government was in effect a racial dumping ground for the Reich, as a bulk of the concentration and death camps were located within its boundaries. Indirect rule, through quisling (collaborationist) rule was effective in areas with elites wishing to adhere to or work within the greater Third Reich. Vichy France and Norway are the most notable examples of this type of arrangement. However, given the nature of National Socialism, its racist doctrines, and its lack of consistent policies, along with the competing policies of the SS, the Wehrmacht, party-state bureaucracy, and local administrators (*Gauleiters*), German-ruled Europe was fraught with chaos.

Mazower, Mark. *Hitler's Empire: How the Nazis Ruled Europe*. New York: Penguin, 2008.

However, when the United States was ceded the Philippines by a defeated Spain, the United States did not recognize Philippine sovereignty. The First Philippine Commission, appointed by President William McKinley in 1899 to assess the new territory, recommended that the Philippines were not ready for self-government and were in need of American direct rule with some characteristics of indirect rule at the local level. This resulted in Filipino resistance to U.S. rule and a war of attrition that lasted until 1902, although guerrilla resistance continued until 1913. The Philippine Organic Act of July 1902 passed by the U.S. Congress ratified President McKinley's Executive Order establishing the Philippine Commission as the upper house of the legislature with a popularly elected Philippine Assembly. While most local affairs were handled by natives according to this new arrangement, the U.S. colonial authori-

ties had the last say in political affairs in the rule of the Philippines until 1946.

British direct rule of Burma was instituted as a result of a series of wars between British forces and the Burmese resistance in the late nineteenth century. Burma was made a part of British India in 1886. Well into the twentieth century, the civil service of British Burma was composed primarily of Anglo-Burmese and Indians. The Burmese were excluded almost entirely from military service, which also was composed primarily of Indians and Anglo-Burmese. Local Burmese were not seen as reliable enough to serve the British administration. Widespread resistance by Buddhist organizations established by Burmese students was an annoyance to British authority; however, this form of resistance did eventually lead to the development of British Burma as a colony separate from British India in 1937. Continued resentment against British rule led some Burmese resistance organizations to seek common cause with the Japanese during World War II in the hopes that they would help them oust the British, although the prospects for Burmese independence under the Japanese soon proved groundless, and the British were then seen as allies in Burmese efforts to oust the Japanese occupation. After the war, Britain again set up its colonial authority over Burma, leading to widespread resentment. However, Britain could no longer retain the trappings of empire due to financial hardship and its ebbing role as a world power, and as a consequence Burma achieved independence from Britain in 1948.

A third example of direct rule was Ethiopia (Abyssinia). Italian rule over Ethiopia began after the Italian-Ethiopian War (1935–1936), which resulted in the creation of Africa Orientale Italiana (Italian East Africa), encompassing Italian Ethiopia, Somililand, and Eritrea. In the 1930s, despite the continued existence of the European overseas empires, European public opinion viewed expansive colonialism with distaste. Thus, Italy was criticized internationally for its war against a sovereign African power and subject to economic sanctions and condemnation by the League of Nations. Italian dominion of Ethiopia was characterized by military occupation authorities continuing to fight a war of attrition against remaining guerrillas even after the capitulation of the Ethiopian government.

Italian atrocities against captured militants and local resisters characterized Italian direct rule over Ethiopia. The inability of the Italian government to recruit Italian farmers to emigrate and the continuing resistance made Italian control of this colony particularly burdensome in terms of manpower and finances. The Italians placed local Muslim rulers in control of Ethiopian provinces under an Italian viceroy, a move that antagonized Ethiopia's Christian majority and led to continued widespread resistance. With the outbreak of World War II, Ethiopian resistance succeeded, as the beleaguered Italians, now fighting on multiple fronts at the whim of their German ally, were ousted and defeated with Allied assistance and support. By 1943, Italian forces were no longer in control of any part of Ethiopia.

Indirect Rule

Indirect rule is the governance of a conquered territory through the control of local institutions. The system gained particular prominence in nineteenth- and twentieth-century colonial empires. In colonial states relying on indirect rule, the higher tier of government was typically recruited from the motherland, while actual governance of the local population was delegated to tribal rulers. Different political, legal, and economic regimes were applied to both segments of colonial society. The system was usually perceived merely to integrate existing polities into the colonial state, but it often created and always deeply transformed local political structures. Indirect rule changed the political order and the relation between state and society in many colonized countries and contributed to the increasing role of ethnicity and patronage. While indirect rule is most widely associated

with British colonialism, many traits of the system are found in other colonies as well.

When modern colonialism started to strive for real territorial control during the nineteenth and early twentieth centuries, the paucity of colonial resources of domination quickly became apparent. The number of civil servants and military forces in the colonies was insufficient for an effective control of the entire population, and their lack of knowledge about and insufficient understanding of the colonized people created further problems. Attempts to replace effective governance by subjugation through terror had often proven dangerous and inefficient. In practice, colonial rule was mostly limited to some towns and to those areas immediately surrounding administrative and military posts.

In order to increase its reach, colonial powers began to negotiate with local rulers and co-opt them into their system of governance. In India, residents of the British East India Company managed to establish British suzerainty over local rulers, a system that was then taken over by the British government. In mid-nineteenth-century Natal (today part of South Africa), the British introduced a system of differentiation between whites and indigenous Africans whereby Africans were subject to a different set of laws that was applied by local headmen. These systems of indirect rule were gradually, and with much debate, adopted in other colonies. Between the world wars, this arrangement, born from failure rather than choice, was turned into a strategy, most notably by Lord Lugard, who published his *The Dual Mandate in British Tropical Africa* in 1922. Based on his experience as high commissioner (1900-1906) and governor-general (1912-1919) in Nigeria, Lugard systematized indirect rule into a coherent ideology of domination.

However, the system of indirect rule was not only founded on pragmatism. Its ideology was built on European assumptions about native societies. They were thought to be ahistoric, unchanging, paternalistic entities governed by chiefs and headmen. The role of the chiefs was conceptualized by many Europeans as similar to that of feudal lords in early modern Europe. Consequently, each individual was thought to be a member of a tribe that was fully represented by its chief, and if the colonial state established

➤ LORD LUGARD ON THE CREATION OF TRIBES AND TRIBAL RULERS

Lord Frederick John Lugard (1858–1945) served as a British colonial administrator and as governor-general of Nigeria from 1914 to 1919. In his work *The Dual Mandate in British Tropical Africa* (1922), he argues for the necessity of colonizing the natives for their own protection and progress in addition to the profit and prestige that imperialism would bring to Britain. The following excerpt illustrates his attitude regarding the policy of indirect rule of African peoples.

“Here, then, in my view, lies our present task in Africa. It becomes impossible to maintain the old order—the urgent need is for adaptation to the new—to build up a tribal authority with a recognized and legal standing, which may avert social chaos. . . .

The first step is to hasten the transition from the patriarchal to the tribal stage, and induce those who acknowledge no other authority than the head of the family to recognize a common chief. Where this stage has already been reached, the object is to group together small tribes, or sections of a tribe, so as to form a single administrative unit, whose chiefs . . . may be constituted a “Native Authority” . . . through whom the district officer can work instead of through alien subordinates. His task is to strengthen the authority of the chiefs, and encourage them to show initiative; to learn their difficulties at first hand, and to assist them in adapting the new conditions to the old. . . . In brief, tribal cohesion, and the education of tribal heads in the duties of rulers, are the watchwords of the policy in regard to these backward races.”

domination over the chief, it would be able to govern the whole group through him. In addition, natives were thought to be fundamentally different from Europeans. As such, they had to be subject to different laws based on their own customs and to a different system of governance

in line with their own traditions. The power of the idea of indirect rule lay in the combination of pragmatism and ideology. The system fit all of these wrong assumptions about natives and solved the problem of insufficient resources.

In the ideological rivalry between the different colonial powers, indirect rule was most closely associated with British colonialism, while French rule, for example, was thought to be much more assimilatory and direct. Practical constraints, however, made some elements of indirect rule necessary for colonial administration in general. All colonial powers experimented with different forms of government, and differences between two colonies belonging to the same European power could be as great as those between colonies of different countries.

The application of indirect rule had important consequences for colonized populations, consequences that continue to shape many post-colonial societies to this day. Local politics were retraditionalized, political tribalism was reinforced, and a rift was created between traditional and modern elites.

Precolonial political systems often did not meet the needs of the colonial state with regard to a clear distribution of competences and an established hierarchy of power. All variants of political systems occurred, from acephalous societies to authoritarian kingships. Power was often contested by several leaders or systems of leadership, and different types of power could balance each other. To make these divergent political systems compatible with colonial rule, the administration had to pick out individuals and institutions that could be strengthened and transformed into chiefs and tribes. As natives were thought best to be governed by traditional law, local norms and customs had to be identified and codified. Colonial officials usually relied on chiefs and old men to tell them about these customs, took their partial point of view as the reality, and started to enforce it. Both through the identification of local leaders and the codification of customary law one group of actors came to be privileged over all others. For the leaders co-opted by the colonial state, their new position often constituted an important source of power and wealth.

The frame of reference in which this establishment of political domination took place was

the tribe. Every colonial subject was allocated to an ethnic group and subject to the authority of its leaders. Any access to the colonial state was channeled through traditional authorities. This greatly increased the leverage of local rulers by providing the resources for internal patronage. Ethnic unities were established as politically and economically meaningful entities separately integrated into the colonial state. By creating a traditional system of governance compatible with colonial administration, the practice of indirect rule simultaneously strengthened ethnicity and local class structures.

The most radical application of the principle of indirect rule was the homeland system in South African apartheid politics. The ideology of a fundamental difference between Europeans and natives that found its expression in different laws and different economic regimes for both, the principle of limited self-government and self-taxation of natives, and the partition of a society into different isolated groups were all carried to extremes within the homeland system.

By establishing a principal difference between European and native societies, indirect rule subjugated local politics to the colonial state while simultaneously excluding its citizens from political participation in it. Indirect rule barred the way to upward mobility through local politics and helped to create a rift between society and the modern state that still shapes many post-colonial societies.

■ Introduction: Socialism

The first half of the twentieth century was characterized by the further development of socialist political structures and movements in much of the world, building on precedents from the prior century. The Russian Revolution led to the establishment of the first communist state in the world in 1917 followed by the establishment of the social democratic Weimar Republic in Germany in 1918. Moreover, socialist parties and movements across Europe, the Americas, Asia, and Africa thrived despite their curtailment under repressive regimes in certain instances. Socialism, in all its variants, criticized the oppression of colonial peoples and the working classes. Communists sought to remove all institutions and traditions that retained any semblance of the trappings of capitalism. In contrast, social democrats sought to create a more egalitarian society gradually through existing liberal political structures and to expand

state power in order to ensure social equality. These differences led to antagonism and divisiveness in the interwar period, most overtly in the case of Weimar Germany and the Spanish Republic during the Spanish Civil War; this lack of a unified front on the Left often led to the success of authoritarian movements.

—Abraham O. Mendoza

Socialism in Africa

Socialism in Africa dates back to the beginning of the twentieth century and the struggles against colonialism. Although the implementation of socialist policies was not possible in early twentieth-century Africa because colonial governments controlled the continent, the popular acceptance of socialist ideas was growing in response to the political and social needs of

➤ LÉOPOLD SÉDAR SENGHOR

Léopold Sédar Senghor (1906–2001), was one of Africa's leading intellectuals in the twentieth century and the author of African Socialism. As a poet, a politician, and a black citizen of France, he openly encouraged the celebration of blackness. Blending Marxism with the literary movement and ideology of negritude, his African Socialism advocated universal freedom. African Socialism attempted to integrate African communalism with Western modernization in an effort to return Africa to a path of egalitarianism and the allotment of resources for the enrichment of all members of a community. Born in Joal, Senegal, Senghor was the fifth child of Basile Diogoye Senghor and his third wife Gnylane Bakhoun. An ardent negotiator able to balance competing responsibilities and loyalties, Léopold Sédar Senghor was able to take his place as the first president of Senegal (1960–1980), a Christian leader in a Muslim nation.

Senghor's extensive writings demonstrate knowledge not just in political theory, Marxism, and socialism but also in linguistics, philosophy, and sociology. Yet he is equally renowned for the passion of his poetry. Senghor's poetry celebrated rhythms of the African landscape and life as it admired the strength and beauty of African women and paid homage to African music and art. He published seven volumes of poetry. His early poems collected in volumes titled *Chants d'ombre* (1945), *Hosties noires* (1948), and *Éthiopiennes*

(1956) provide the essential components of negritude, which contrasted the warmth and richness of Africa to the sterile coldness of Europe. In 1964 he published a collection of essays on negritude, humanism, and socialism titled *Liberté*. Other essays, lectures, and speeches appear in volumes published by Éditions du Seuil, Paris.

An essential objective of Senghor's writings was to define black as beautiful against a global milieu of racial injustice and discrimination. Using poetry and politics, his theory of negritude attempted to rebuild the validity of African culture and to establish a positive image of black consciousness. negritude held that there existed in blackness a special social quality and humanness. Senghor's 1948 *Anthologie de la nouvelle poésie negre et malgache de langue française* (introduced by Jean-Paul Sartre's landmark essay "Black Orpheus") was perhaps the true manifesto of negritude.

Senghor received numerous honors for his writings and political leadership, including the Dag Hammarskjöld Prize (1965), the Peace Prize of German Book Trade (1968), the Haile Sellassie African Research Prize (1973), and the Apollinaire Prize for Poetry (1974). In 1969 the French Academy of Moral and Political Sciences awarded him membership. He received a nomination for the Nobel Prize in Literature in 1962.

—Lorna Lueker Zukas

Africans, which were not being met by colonial rulers. Socialist leaders promoted an independent Africa in which the state controlled the redistribution of wealth, the development of economic programs for the well-being of all people, the need to develop institutions to create appropriate paths to development, the quest for a cohesive society without class or tribe distinctions, and finally the creation of stronger links between state policies and cultural practices. Socialism, as it was conceived, would help African nations overcome the brutalities of colonialism, discover the essence of human purpose in traditional African societies, and allow Africa to reassert itself in a modern context and develop through egalitarian policies scientifically devised and appropriately applied.

After 1917 Marxist-Leninist ideas defined socialism throughout colonial Africa. These ideas resonated with African intellectuals, educated in Europe and America, who were rebelling against colonial intruders who had no room for the majority of Africans except as low-paid exploited workers and against political systems that did not allow for black majority rule. International ideological movements resembling the Leninist anti-imperialist Communist International (Comintern) and other social movements as well as independence struggles on other continents of the world fueled the development of socialist ideas. Socialism in Africa began as a borrowed idea from Europe, namely from the French Communist Party, the German socialists, and the Russians. However, African intellectuals indi-

genized socialism as a path toward a higher and reconciled form of society that could reaffirm Africa's cultural and political heritages. Expressions of socialist ideals were prominent among individuals who were active in trade unions and political parties.

A shared history of socialism, working-class organizations, and national liberation struggles began in South Africa in 1909 when a Native Convention was held in Bloemfontein and subsequently led to the formation of the African National Congress (ANC) in 1912. Also in 1909 the South African Labor Party formed among white working-class laborers. This organization became the anti-imperialist International Socialist League (ISL) in 1915. In cooperation, the ANC and the ISL launched the first industrial African trade union in South Africa, the Industrial Workers of Africa. In 1919 the Industrial and Commercial Workers' Union of Africa (ICU) was formed in Cape Town, and within ten years membership reached 100,000 workers. The ICU was clearly influenced by socialist ideas; in the preamble to its constitution members are assured that the union will seek higher wages, better working conditions, pensions, sick leave and unemployment allowances, and the protection of workers' rights. The International Trade Union Committee for Negro Workers (ITUC-NW) was also formed with socialist backing and strong African representation.

The International Socialist League and several other South African socialist organizations merged in 1921 to form the Communist Party of South Africa (CPSA), the first Communist Party on the African continent. The ISL was the main component of the CPSA when it became a member of the Comintern in 1921. By 1924 the vast majority of its membership was black, and by 1928 the CPSA had become the first party in South Africa to call openly for independence and black-majority rule. Communists were instrumental in forming the first Non-European Trade Union Federation (1927) and in 1941 the Congress of Non-European Trade Unions.

International connections were strengthened among socialists, nationalists, labor parties, and freedom fighters in 1927 when members of the ANC traveled to the inaugural Congress of the League against Imperialism that

took place in Brussels during February 10–15 that year. This historically significant congress brought together anticolonial fighters from around the world. The conference also marked the first time in history that representatives of the progressive labor movements of the capitalist countries were united with delegates from the labor and national liberation movements on all continents. The aim of the participants was to take up the struggle for the independence of colonized countries and fight against imperialism on a wider front.

International travel and exposure fueled the development of socialist ideas across Africa. The men who became Africa's first generation of leaders were primarily socialist. Studying the philosophy of political freedom and democracy and examining the history of representative institutions, legal codes, and the impartial judiciary, these students began to demand political independence and the right to self-government for Africa. Colonialism represented alien control of mind and body; the ideas of socialism offered a chance for freedom and unity. Immediately following World War II, African leaders called for the implementation in Africa of the principles for a free world order as were laid down in the 1941 Atlantic Charter, and at the 1945 United Nations Conference they demanded that these principles apply wholly to the colonized world and thus end colonialism.

Despite the progress of socialism in Africa, little homogeneity existed among the various plans of action to bring about the creation of independent African socialist states. The main points of contention of socialism in Africa were the problem of continental identity, the form of economic development, and the dilemmas of control and class formation. Not willing to completely align themselves with the East or the West, African socialists strove to define their own political ideology. To avoid becoming pawns in the international struggles, African socialists developed doctrines that distinguished them from their European counterparts. The socialist leaders contended that prior to colonialism Africa was indigenously based on socialist practices of communal land ownership, the existence of primarily noneconomically stratified societies, and the redistribution of resources

among kinship networks. After 1945 leaders of Africa's newly independent nations attempted to implement the political, economic, and social ideals of socialism. Men such as Kwame Nkrumah, Léopold Senghor, Ahmed Sékou Touré, and Julius Nyerere stand out among the important early national African leaders.

Socialism in South Asia (British India)

In considering socialism in south Asia, we are considering the area from Kashmir southward encompassed by the British empire until its independence in 1947. Economic resentments were at the forefront of the development of Indian nationalism, with various forms of socialism contending for primacy as parts of the many developing nationalist movements.

After 1858 the British ruled or controlled all of the south Asian subcontinent from Kashmir southward under the generic name “India.” The economies of the societies gathered under the rubric ranged from herding and subsistence farming to sophisticated urban areas with dynamic banking and commercial trading networks. There is no doubt that British rule was extractive—India was supposed to pay its fair share of the debts of the empire—but the actual degree of British economic influence cannot be precisely established. Certainly it can be argued that the British-Indian relationship delayed industrialization by at least half a century and perhaps much more, but there were great areas in the interior that appear to have been relatively untouched. Until the beginning of World War I, their relationship was typical of colonial ar-

rangements: India exported raw materials to Great Britain and imported manufactured wares. Such arrangements, working to the detriment of colonies, produce fertile soil for the introduction of socialism in one form or another. Although political action intensified after World War I, the Indian National Congress of 1885 provided a good start. Trying to trace the various groups after that point is possible (but difficult) for only the most dedicated historians; organizations of the various groups identified as “Congresses” or “congressional” that were agitating and planning for nationalism merged, blended, and separated at a dizzying rate as the focus of elements of their membership shifted from time to time.

In the development of Indian nationalism, a sense of economic oppression was fed by other important issues. Although “indirect rule” was the British goal, all the upper-level government posts were held by Britons, yet Indians were expected to support the empire in all instances. Furthermore, about 60,000 Indian soldiers died in World War I, a war in which Indians felt that they had little to gain and much to lose. Indian taxpayers were expected to pay their prorated share of the expenses of war. After the war, a realization of British dependency on Indian wealth and manpower made European might far less intimidating; many Indians in fact realized that Britain needed India more than India needed Britain, economically as well as politically. Indian nationalism burgeoned, and the “drain of wealth” from India to Great Britain was the topic of heated debate (and an issue that has never been fully resolved), but it is impossible to deny that great wealth did drain from India into British projects.

As nationalist groups agitated for independence, the colonial state unwisely responded with repressive laws at a time of economic uncertainty. By the 1930s the severe economic crisis brought about by the Great Depression had intensified resentment of British economic policies in India. Several distinct forms of socialism were proposed by various groups. Socialism per se is a political system based on ideas of equitable economic organization but is interpreted in many differing ways, some opposed to capitalism and others considering socialism a means of

maintaining a healthy capitalistic system. The most extreme group, the Communist Party of India, was active by the early 1920s, but other less radical socialist groups, such as the Congress Socialist Party (founded in 1934), organized and gained in influence during the depression. Early leaders of the Indian Congress Party, such as Dadabhai Naoroji (1825–1917), Gopal Krishna Gokhale (1866–1915), Jawaharlal Nehru (1889–1964), and Mahatma Gandhi (1869–1948) worked toward a national socialist democracy. On the local level, Gandhi especially promoted socialism but in a manner that emphasized a tight-knit community with strict social mores to promote a virtuous peace-loving society devoid of traditional caste divisions.

After independence and partition following World War II, under the leadership of the Congress Party India adopted aspects of socialism and nationalized a significant portion of industries and natural resources to control the economy and allow it to grow rapidly, but neither Gandhi's dreams of self-sufficient villages nor the Indian Communist Party's radical agenda prevailed. Even before independence, the Congress Party had established national planning committees with the goal of building an industrial base and combating illiteracy and poverty. At the time of independence, Nehru, the prime minister, was pursuing a policy of development involving both nationalization of heavy industry and close cooperation with powerful capitalist groups. Two splinter groups from the Congress Party formed the Praja Socialist Party (PSP) in 1952, indicating the enduring strength of the socialist vision in south Asian politics for the decades that followed.

Socialism in East Asia

Two factors spurred the spread of socialist ideas in early-twentieth-century East Asia. The first was the communist success in the Bolshevik Revolution of 1917; the second was the Paris Peace Conference of 1919–1920 that seemed to promise liberation from colonialism and ensure national self-determination. This gave hope to colonized people throughout East Asia and provided the motivation for two major nationalist movements in 1919: Korea's March First Movement and China's May Fourth Movement. Asian efforts failed to bring liberation, however, and the Western international community largely ignored them. When it became clear that the principle of national self-determination applied only to Europe, people throughout Asia rejected the West and its perceived hypocrisy. Many in Asia saw in Marxism a chance to reject the West and its values while at the same time surpassing them, and thus socialism began to attract a sizable following in East Asia.

Socialism's earliest and strongest followers in East Asia were in China. The Chinese Communist Party (CCP) was founded by leading Chinese intellectuals in Shanghai in 1921 with a small membership represented by some 12 delegates. Mao Zedong, who would emerge in the 1930s as the leader of the CCP, was among the delegates. In a marriage of convenience designed to further their goal of socialist revolution in China, the fledgling CCP allied itself with the larger Nationalist Party, the Guomindang, (GMD) in 1923 with the intent of wiping out the warlords who had come to power in the wake of the 1911 fall of the Qing dynasty. A reunified China, went the reasoning, would then move through a capitalist phase toward the ultimate goal of socialist revolution. This goal, however, was interrupted by years of conflict with Japan during which time serious conflict also broke out between the CCP and the GMD. After Japan's defeat in World War II, civil war once again broke out between the CCP and the GMD, as both parties struggled for control of China. Defeated in 1949, the GMD retreated to Taiwan, and the victorious CCP established the People's Republic of China in October 1949.

Socialist ideas also found adherents in both Korea and Japan in the early decades of the twentieth century. In both cases, however, government repression prevented their early spread. Japan's strongly authoritarian government succeeded in limiting communist activity, and during the war years (1931–1945) thousands of Japanese were arrested and imprisoned for espousing communism. A major turning point in the history of socialism in Japan came in 1933 with a wave of *tenko* (“turn-about” or “about-face”) when two leaders of the JCP issued jail-cell repudiations of socialism and professed allegiance to Japan's imperial government and its military “Mission in Asia.” This all but crippled the communist movement in Japan. At war's end while endeavoring to promote democracy in Japan, the Allied Occupation released all political prisoners, including the communists. After an initial swell in communist ranks in the immediate postwar period, improved living conditions—fostered in part by sweeping land reform—undercut the growth of socialism in postwar Japan.

As in Japan, socialism was thoroughly suppressed in Korea under Japanese colonial rule from 1910 to 1945. When Japan's surrender in World War II led to Korean independence, socialist ideas again caught the popular imagination. However, the postwar occupation by the United States in the south and Soviet involvement in the north prevented the Koreans themselves from determining socialism's success or failure on the peninsula. While the United States endeavored to contain the growth of socialist organizations in the south, the Soviet Union fostered their growth. Separate elections in 1948 resulted in the creation of the noncommunist Republic of Korea in the southern half of the peninsula and the communist Democratic People's Republic of Korea in the north. The 1950–1953 peninsular war failed to reunify the country and led to a 1953 armistice that created an uneasy truce between the commonly called North Korea and South Korea.

Socialist Movements in Southeast Asia

Socialist movements typically develop within industrialized societies where popular politics and electoral processes are firmly established. In much of Southeast Asia, however, Western colonial rule in the early twentieth century provided little room for electoral politics, and the region's primarily agricultural economies also deterred European-style socialism. The local socialist impulses that did emerge tended to find expression in unionism, particularly among workers employed in small but growing industrial enterprises.

Such progressive developments occurred largely at the fringes of colonial society. Metropolitan powers used a combination of local rulers, traditions of hierarchy and order, and external military force to maintain their control of Southeast Asia, and in turn they financed mining and plantation agriculture, used cheap and unorganized labor, and oversaw the collection of taxes, tariffs, and fines. By the mid-1930s most Southeast Asian colonies had links to the international economy, and the combined effects of World War I, the Russian Revolution, and the Great Depression forced colonial authorities to allow some progress, albeit unevenly, across the region. This progress was primarily aimed at promoting self-governance and political expression. Elections were introduced, notably in Burma and Malaya, and small socialist movements began to take shape, sometimes aided by socialist activists from the metropolitan power.

By 1910 Indonesian indigenous leaders with political interests began to establish Pan-Islamic movements and organizations, including the broadly popular Sarekat Islam (Islamic Union) alliance. The Sarekat Islam promoted popular political activity beyond the reach of Dutch authorities and stimulated the creation of Indonesia's first labor union, organized by railway

workers. Dutch socialists arriving in Indonesia from the Netherlands helped found socialist groups including the Indies Social Democratic Association (1919) as well as socialist newspapers and journals. During World War I Indonesian socialists, initially focused on labor issues and land reform, shifted to more radical anticolonial and communist political agitation. By 1920 the nation's socialist movement had been eclipsed by the ill-fated Bolshevik-style radicalism of the new Perserikatan Kommunist di India (Communist Party of the Indies).

The French Indochinese colonies in Laos, Cambodia, and Vietnam experienced virtually no popular electoral activity before or during World War II, but in the Philippines, which the United States seized from Spain after the Spanish-American War (1898), municipal and local elections were introduced in 1901, just as a powerful guerrilla movement developed against U.S. rule. While American troops suppressed the insurgency, new electoral institutions, including by 1907 a National Assembly, were taking shape. However, political party development in the Philippines was dominated by the issues of nationalism and progress toward independence from the United States, and no significant socialist movement emerged. America's defeat of the Japanese occupying forces in the Philippines returned the United States to power in 1945. However, by this time the U.S. government had determined that in order to prevent the rise of Leftist groups in the colony, the islands should gain political independence, which was granted in 1946.

Each Southeast Asian colony also housed relatively small but economically powerful ethnic Chinese minorities. Operating as traders, merchants, and financiers, these Chinese minorities were firmly entrenched in the increasingly internationalized economy of the region. Moreover, most of the overseas Chinese in Southeast Asia remained closely connected to political events in China and rejected both the ideals and the local expressions of socialism. By the late 1930s the political sentiments of overseas Chinese communities in Southeast Asia were split by the civil war in China. Except where Chinese workers dominated industrializing economies, as in Malaya and Singapore,

➤ LABOR UNIONS IN MALAYA AND SINGAPORE

The worldwide depression of the early 1930s caused exports of Malaya's chief products, tin and rubber, to plummet. Job losses led skilled tradesmen and unskilled laborers, many of them Chinese, to organize unions in Malaya and Singapore. Strikes involving thousands of workers were launched in 1936. Beginning at pineapple canning factories in Singapore and Johore, socialist-inspired sympathy strikes developed among construction, quarry, and municipal employees. By 1937 more than 10,000 plantation and mine employees joined the movement. Rather than suppressing the unions, colonial authorities urged employers to meet the strikers' demands. Communist influence was derailed. Laborers' wages improved, and by 1941 socialist-oriented unions were common throughout Malaya and Singapore.

—Laura M. Calkins

most overseas Chinese in Southeast Asia opposed labor movements and socialist politics in favor of unrestricted free trade.

Socialism in Western Europe

From 1900 to 1945, socialism, as a political force, expanded in Europe as socialists gradually attained political power, particularly in Britain, France, and Germany. At the turn of the century, European socialist parties had been able to gain many seats in their respective legislatures as the main representatives of the working class. Yet throughout these decades, the movement also found itself threatened by the growth of the fringe Left and Right.

➤ ANARCHO-SYNDICALISM IN SPAIN

One fringe political movement that shaped the course of Spanish politics during the interwar Spanish Republic (1931–1939) was anarcho-syndicalism. Anarcho-syndicalism in Spain was advocated by the Confederación Nacional del Trabajo (National Confederation of Labor, or CNT), which was a national Spanish organization composed of various anarcho-syndicalist labor unions. Ideologically anarchist—which meant that they were in opposition to any form of organized government—these unions supported the establishment of a society completely run by labor union councils, be it in the factory, in the market, or in agriculture. They were not only at odds with the previously existing conservative regime of Alfonso XIII but were also opposed to the liberalism advocated by republican and socialist parties. The CNT was also opposed to communism, which it viewed as just another form of centralized government. Nonetheless, CNT members voted for and supported the Popular Front in the elections of 1936, which ultimately prompted the outbreak of the Spanish Civil War. During the war, the anarcho-syndicalists became adamant supporters of the Spanish Republic as it fell under siege by Francisco Franco's nationalist rebels and their German and Italian fascist allies. This meant that CNT followers set aside their ideological fervor in order to work with liberals, republicans, socialists, and communists against a common aggressor. While ultimately defeated by Franco's forces in 1939, they had provided substantial support to the beleaguered Spanish Republic in the form of anarchist militias.

—Abraham O. Mendoza

Before World War I, socialist parties, particularly in France and Germany, made significant inroads into their respective governments as representatives of not only their working-class constituencies but also segments of the middle classes and some rural districts. “Revisionists,” such as Eduard Bernstein in Germany and the Fabians in the Labour Party in Britain, advocated a more moderate stance and rejected the original Marxist call for revolution. These moderates, found within some socialist parties, preferred to work within the confines of liberalism until the day when they could lead their respective societ-

ies into utopia. However, this meant that many socialist parties in Europe, such as the Social Democratic Party (Sozialdemokratische Partei Deutschlands, SPD) in Germany, the French Socialist Party (Section Française de l'Internationale Ouvrière, SFIO) in France, and the Labour Party in Britain would break with their Far Left Marxist brethren who still yearned for revolution. Moreover, this allowed them to develop a certain air of respectability among more moderate voters who sympathized with the working class. Nonetheless, they were deemed as traitors by their fellow Marxists on the Left.

The outbreak of World War I led to further rifts among European socialist parties. Socialist parties in France and Germany split into those supporting the war and those opposed to fighting their fellow proletarians. In Germany, the antiwar faction split and formed the Independent Social Democratic Party (Unabhängige Sozialdemokratische Partei Deutschlands, USPD) in 1915 after refusing to vote for further war credits. The Spartacus League was a significant element within the greater USPD organization, with Karl Liebknecht and Rosa Luxembourg in its stead. At war's end, with the outbreak of the German Revolution in 1918 under the leadership of the USPD (KPD or Communist Party of Germany after December 1918), the SPD sought the support of the militarist Freikorps (Far Right militias) to end the urban uprisings. By 1920, the Freikorps had destroyed the insurgency and restored order, placing the SPD under suspicion in the eyes of many German Leftists.

The outbreak of the Russian Revolution in 1917 also had a significant impact on European socialism in the interwar period. The primacy of Bolshevism and the formation of the Third International (Comintern) in 1919 created an international network of communist parties following directives from Moscow. As a result, the SPD, the SFIO, and the British Labour Party were all threatened by the emergence of stronger communist parties during the interwar period. The SFIO was split in 1917 as its more Leftist members formed the French Communist Party, which was part of the Comintern. The split weakened the SFIO during this period as the Center Right was able to hold power throughout much of the 1920s. In Germany the KPD, under the leader-

ship of Ernst Thälmann, established closer links with Moscow and thus managed to develop a significant role in the context of the interwar politics of the Weimar Republic. As a result, the SPD developed a more moderate course of action to distinguish itself from the more radical KPD, thus advocating social democracy within the confines of the German republic. The SPD managed to create a viable welfare state in Germany in the early 1920s as long as they held power. In Britain, Ramsay MacDonald's Labour government of 1924 was suspected of working for the Comintern as he sought to recognize the Soviet Union. As a result, his government fell late that year. While he was able to lead another government from 1929 to 1931 as His Majesty's prime minister, he was deemed a traitor to his class for working with the British Conservative Party to seek a solution to the financial crisis.

The Great Depression throughout Europe also contributed to the weakening of socialism during the 1930s. As conservative Center-Right governments in Britain, France, and Germany were increasingly unable to deal with the expanding global economic crisis, socialist parties found themselves in a seemingly opportune moment that did not turn to their advantage. In Britain, Conservative prime minister Stanley Baldwin and his cabinet took the pound off the gold standard and raised tariff barriers after forming a trade bloc with the British dominions and colonies. As a result, German, French, and Italian governments did likewise, severely cutting off imports and reducing their own exports. Socialist parties, which were out of power by then, had become powerless to stop this development, which sent all European economies into a downward spiral, throwing millions out of work and into destitution. As a result, fascist and communist parties, formerly on the political fringes, became a more popular and significant threat to the moderate socialist parties. With the Soviet Union showing itself immune to the Great Depression, many desperate workers flocked to Communist Party rallies, particularly in Germany. Other Germans found the Nazi Party appealing, as it blamed Jews for the ills of the country and promised to restore the glory of the Reich.

By 1935, Josef Stalin worried that the economic collapse of Europe and the resulting

growing popularity of fascism might threaten the Soviet Union. The rise to power of Adolf Hitler and National Socialism in 1933 had proven to be disastrous to both socialism and communism, as the SPD and KPD were outlawed and its members persecuted. Many of its leaders ended up either in concentration camps, in exile, or in resistance movements for the duration of the war. As a result, the Comintern advised its affiliate European parties to form "Popular Fronts" with socialist and centrist republican parties against the fascists, taking into consideration the interests of the middle classes. The Popular Front tactic led to the victory of socialist Leon Blum in France as a result of the collaboration of the French socialist and communist parties. The tactic also led to the election of the socialist government of Largo Caballero in Spain as a result of the collaboration of socialists, communists, and anarchist-syndicalists. However, the Popular Front government of Leon Blum was unable to stay in power long due to a large worker uprising and the outflow of gold from France. In Spain, the victory of the Popular Front led to the Spanish Civil War, as General Francisco Franco led a nationalist revolt against the Spanish Republican government with the help of Nazi Germany and fascist Italy. Soviet support of the Spanish Republic waned as the Comintern sought to impose its directives on the Spanish socialists (Socialist Party of Spain, PSE), not to mention anarchist-syndicalists and Trotskyites. As a result, socialists fell out of power in Europe as fascists gained the upper hand. With the signing of the Nazi-Soviet Non-Aggression Pact of 1939, the official Comintern line against fascism was that communism held no quarrel with Germany and its fascist allies. This angered many communists, who broke away from their Comintern-affiliated parties, leading some to join socialist parties.

During World War II (1939–1945), socialists in Axis-occupied Europe were persecuted. People such as Blum and Thälmann spent the duration of the war in concentration camps. Other socialists and communists managed to escape to Britain or the United States or even the Soviet Union, where Thorez spent the war, while others chose to work as part of underground resistance organizations. In 1945 with the end of the

war, European socialist parties sought again to distinguish themselves from the communists advocating revolution, as the future antagonism between the West and the Soviet Union was already beginning to show itself.

Socialism in Latin America

During the first half of the twentieth century, three general stages characterized socialist movements in Latin America. At the turn of the century, socialism persisted as an imported political ideology that aided in the creation of early workers' parties. During the second stage, the Russian Revolution of 1917 inspired the rise of political activism, which received support and leadership from the Soviet-led Communist International (Comintern). Finally, the influence of Stalinism, the policy of a popular front uniting many center-Leftist political parties, and the decrease in anti-imperialist rhetoric marked the development of socialism after 1935.

Socialism was first introduced throughout Latin America toward the end of the nineteenth century by European immigrants. Increased urbanization and the beginnings of industrialization accompanied the large-scale immigration of Europeans to Latin America. As a result, the first workers' parties began to form as their early leaders embraced socialist ideas and European precedents. However, in Latin America the moderate socialist goals sometimes failed to attract the interest of immigrant workers. For example, the Argentine Partido Socialista (Socialist Party), founded by Juan B. Justo (1865–1928) in 1895, advocated an electoral and evolutionary strategy for reform, but Argentine workers generally supported anarchist organizations that called for direct action via

general strikes. By contrast, the more revolutionary Chilean Partido Obrero Socialista (Socialist Workers Party), founded in 1912 by journalist and intellectual Luis Emilio Recabarren (1876–1924), achieved immediate electoral success and played a leading role in the nascent Chilean labor movement.

The terms “socialism” and “communism” were almost interchangeable until the consolidation of power by the Bolsheviks as the Communist Party in postrevolutionary Russia. The Third International (Comintern), held in 1919, cemented Soviet leadership of worldwide socialist movements, and after 1919 communism as a form of government became the political goal of socialist movements affiliated with the Comintern. In addition, the rise of the Comintern limited interaction between socialist movements in Latin America and their contemporaries in the United States in part because of the split between the Socialist Party of America and the Comintern and the latter's anti-imperialist, and hence anti-U.S., rhetoric. Support from the Comintern facilitated the foundation of communist parties across Latin America, including in Argentina (1918), Guatemala (1922), Brazil (1922), Ecuador (1925), and Venezuela (1931).

This establishment of communist parties in Latin America took place during the politically active period of the 1920s that lasted through 1935. The most significant socialist theorist in Latin America during this time was Peruvian José Carlos Mariátegui (1895–1920), while the most important political expression of socialism in Latin America was the failed Salvadoran insurrection in 1932. Mariátegui believed that Latin American society needed a socialist transformation that would include agrarian and anti-imperialist objectives. He contradicted the policies of the Comintern by stating that a socialist revolution in Latin America ought not result from the mechanical imposition of a European formula but should instead evolve organically from local conditions and practices. In 1932 the Communist Party of El Salvador, founded in 1930 by a group of union leaders and Leftist intellectuals that included Agustín Farabundo Martí, Miguel Mármol, and Modesto Ramírez, tried to enact such an indigenous, socialist transformation. However, the

➤ AGUSTÍN FARABUNDO MARTÍ

Agustín Farabundo Martí (1893–1932) was born and raised in rural El Salvador, where from an early age he identified with rural laborers. As an adult this socialist and revolutionary leader moved across Central America from one self-consciously anti-imperialist fight to another. His itinerant career began in 1920 when, as a result of antigovernment agitation at the Universidad Nacional, the Salvadoran government deported Farabundo Martí to neighboring Guatemala. There he bonded with Quiché-speaking Indian peasants and soon became involved in revolutionary activity against the owners of Guatemalan coffee plantations, who forced his escape to Mexico.

Between 1925 and 1930 Farabundo Martí divided his time between Mexico, El Salvador, Guatemala, Nicaragua, and the United States. He became affiliated with the Liga Antiimperialista de las Américas (Anti-Imperialist League of the Americas) and fought in Nicaragua against the U.S. military occupation under Augusto César Sandino. In 1930 Farabundo Martí became the Latin American leader of the International Red

Aid, an international social service organization affiliated with the Communist International. Also at this time he helped found the Partido Comunista Salvadoreño (Salvadoran Communist Party). The government again deported Farabundo Martí, but he returned clandestinely to his native country.

In March 1931 Salvadorans elected Arturo Araujo president primarily because of his appeals to the lower classes. Neither the ruling classes nor the army favored Araujo, and after an economic crisis began in December 1931, a military coup ousted the president. Popular discontent against the conservative regime built quickly, and in January 1932 a communist-led insurrection of Salvadoran farmers attacked government forces. Farabundo Martí's followers succeeded in taking control of several towns, but the poorly armed group was no match for the army. A strong military repression—popularly remembered as La Matanza (the slaughter)—led to the deaths of up to 40,000 revolutionaries, including Farabundo Martí.

—Jonathan Hagood

conservative and ethnically European government and military leaders easily put down the insurrection, which included peasants' and workers' unions as well as many indigenous enlisted men.

In contrast to Mariátegui's belief in a particularly Latin American variant of socialism, adherence to Stalinism and implementation of the policies of the Comintern characterized socialism after 1935. The model of the Soviet Communist Party and the influence of Stalinist ideology led directly to the creation within communist and socialist parties throughout Latin America of a hierarchical and authoritarian bureaucracy connected to the Soviet leadership. As a result, socialist movements in Latin America adopted the Stalinist doctrine of revolution by stages, and because Latin American society was not yet ripe for socialism, the political goal became the realization of the national-democratic (antifeudal and anti-imperialist) stage.

The Seventh Comintern Congress in 1935 endorsed a method for achieving this stage of

development in the concept of the popular front, an antifascist alliance of communist, socialist, and bourgeois-democratic parties. Although nearly every Socialist Party in Latin America attempted to forge such an alliance, the strategy only succeeded in Chile. There, the Chilean socialist and communist movements united behind the Radical Party and elected Aguirre Cerda president in 1938. By the early 1940s the anti-imperialist portion of the popular front had been replaced by antifascism and an accommodation with the United States and the United Kingdom because of the broad alliance against Nazi Germany.

Socialism in the United States and Canada

Socialist movements in the United States have a history that stretches back to the early nineteenth century. The steady growth of the Socialist Party in the United States was checked during the Red Scare that followed World War I. By the time of the second Red Scare of the 1950s, socialism, along with communism, had been pushed to the fringe in the United States. Labor and laborers did not wish to be associated with movements that had been pathologized by critics. Canada's parliamentary politics ultimately aided socialists' efforts to establish an official presence in politics and governance from the turn of the twentieth century to the present.

In the 1820s the first Workingmen's Parties in the world, commonly called "Workies," were founded in the United States. On December 26, 1877, the Workingmen's Party at its convention in Newark, New Jersey, changed its name to the Socialist Labor Party (SLP). The bitter labor disputes and strikes of the turn of the twentieth century radicalized many labor supporters such as Eugene Victor Debs (1855–1926), who became the secretary-treasurer of the National Brotherhood of Locomotive Firemen in 1880. Serving in this position until 1892, Debs also became the city clerk of Terre Haute (1879–1883) and was elected to the Indiana state legislature as a Democrat in 1885. In 1892 he accepted a position with the American Railway Union (ARU), an industrial union that sought to organize all railway workers regardless of skill. During the Pullman strike, Debs was arrested and sentenced to six months in the Woodstock jail in Illinois for contempt of court. By the time Debs left prison, he was moving toward socialism.

Although Debs supported the populist Democratic candidate William Jennings Bryan (1860–1925) in the 1896 election, by the following year he was ready to break with the Democrats. In the January 1, 1897, edition of ARU's *Railway Times*, Debs declared that "The issue is Socialism versus Capitalism. I am for Socialism because I am for humanity." Later that year the ARU met in a convention in Chicago and voted to dissolve itself and to merge with other socialist groups to form the Social Democracy of America (SDA).

This new organization called for public ownership of monopolies and utilities, public works projects to employ the unemployed, a shorter workday, and a utopian plan for colonization of a western state where socialists could concentrate, win elective office, and thus establish a model cooperative commonwealth. With the success of socialism in one state, they reasoned, the movement would eventually fan out and bring a national cooperative commonwealth to the entire country. In the election of 1900 Debs was their presidential candidate, with Job Harriman (1861–1925) as his running mate.

In the years before World War I the Socialist Party of America (SPA) steadily grew in size, reaching a peak of 118,045 members in 1912. That year the party had elected 1,039 dues-paying members to public office, including 1 congressman, Victor Berger; 56 mayors; and numerous state legislators and local councilmen. The Socialists were strongest in the city of Milwaukee, the only U.S. city to have three Socialist mayors: Emil Seidel from 1910 to 1916, Daniel W. Hoan from 1916 to 1938, and Frank P. Zeidler from 1946 to 1960. In 1904 and again in 1908, the party ran Debs for president and Ben Hanford (1861–1910) for vice president, receiving over 400,000 votes. In 1912 the party ran Debs and Seidel, with their vote doubling to the highest they ever received, 897,011, or about 6 percent of the vote.

The American socialist movement in these years was publishing scores of newspapers and magazines, notably the *Appeal to Reason* from Girard, Kansas, with half a million subscribers. There were several labor colleges and other left-wing schools being established at this time, such as the Rand School of Social Science in New York. Among the student wings of the movement was the Intercollegiate Socialist Society (ISS), founded in 1905 and a direct predecessor of the League for Industrial Democracy, whose student group became the Students for a Democratic Society in 1960. Also founded in 1905 with the participation of many of the Socialists was the radical trade union Industrial Workers of the World (IWW), led by William D. "Big Bill" Haywood (1869–1928). A fight developed in the party over the IWW's syndicalist tactics of sabotage and violence, which led to Haywood's expulsion for the Socialist Party's Executive

Committee in 1913 and the SPA's rejection of violent tactics as counterproductive.

The steady growth of the party was interrupted by events far from American shores. With the outbreak of World War I in 1914, the SPA urged the United States to remain neutral. In the 1916 election the party used a referendum vote for the first and only time in its history to nominate writer Allan L. Benson (1871–1940) for president and lecturer and former college teacher George R. Kirkpatrick (1867–1937) as the running mate, campaigning on a prosocialist and antiwar ticket. Opposition to the war was divisive both within and outside of the world socialist movement. Most of the Second International parties supported their governments when they declared war. Many, like the German Social Democrats, suffered defections and splits over this stance. Within the SPA its antiwar position cost it members and votes, and in the 1916 election the party's vote dropped by a third over its previous 1912 high.

The crisis intensified shortly after the United States entered World War I in 1917. In that year the party's emergency St. Louis convention rejected a prowar resolution offered by John Spargo (1876–1966) and instead adopted a resolution proposed by Morris Hillquit, pledging the party's unalterable opposition to the war and calling upon the workers of all countries to refuse to support their governments in making war. Following the convention, a number of influential prowar socialists quit the party, including Spargo, Robert Hunter (1874–1942), Charles Edward Russell (1860–1941), J. G. Phelps Stokes (1872–1960), Rose Pastor Stokes (1879–1933), and William English Walling (1873–1936), to form the short-lived Social Democratic League of America, which conducted educational campaigns on behalf of the war effort.

In June 1917 the U.S. Congress passed the Espionage Act, amended in 1918 to include a Sedition Act that made several nonmilitary offenses illegal, including using profane, scurrilous, or abusive language about the government. SPA headquarters around the country were raided, and the attorney general withdrew second-class mailing privileges for the party's paper, the *American Socialist*, for the crime of advertising a pamphlet that claimed that the plutocrat John

Pierpont Morgan Jr. (1867–1943) had loaned the Allies \$1.9 billion before U.S. entry into the war and that the U.S. government was protecting this loan that was behind U.S. involvement in the war. As the war continued, other Socialist newspapers also were denied mailing rights.

The October Revolution and Russia's withdrawal from the war brought another wave of mass arrests and censorship in direct violation of the U.S. First Amendment guarantees of freedom of speech, press, and peaceable assembly. Thousands of Socialists were arrested, including Debs for the crime of giving an antiwar speech. Debs was convicted, and the U.S. Supreme Court upheld the decision in *Debs v. United States* (1919). He was sentenced to eight years and served four in the Atlanta federal penitentiary before being pardoned by postwar president Warren G. Harding (1865–1923) in 1922. Debs was the first man to run for president from a prison cell, receiving over 900,000 votes in 1920. He also wrote a valuable and still timely work on prison conditions, *Walls and Bars*. During World War I and the Red Scare period following it in 1919 and 1920, thousands of communists and anarchists were jailed or deported, in some cases for merely making a critical comment in the privacy of their own homes. The SPA and the socialist press never fully recovered from this blow of massive government repression.

During the Great Depression the SPA's membership increased somewhat, although by then the SPA was outdistanced in size by the Communist Party, USA. The Depression had brought into the Socialist Party a new group of young "Militants" who challenged the Old Guard, whom they felt were not doing enough to build the party with the opportunities to do so presented by the extraordinary economic crisis in which American capitalism found itself in the 1930s.

Students of Socialism attempting to explain why Socialism has such a weak presence in the United States focus on issues of factionalism within the party, U.S. government repression during the Red Scares that followed the two world wars, the population's mobility, the refusal of workers to view themselves as "labor" and thus forge a "class consciousness," and the difficulties of creating an effective political presence with the U.S. two-party system.

In Canada, as early as 1890 branches of the U.S. SLP had been established in the cities of Montreal, Toronto, and Winnipeg. By 1899 a Canadian Socialist League was formed by dissidents opposed to Daniel De Leon's (1852–1914) autocratic style of rule in the SLP, as were U.S. radicals at the time who would go on to form the SPA in 1901. Other socialist groups were forming as the nineteenth century gave way to the twentieth century, and they united in 1905 into the Socialist Party of Canada, paralleling the split from the SLP that was taking place in the United States. Although unable to elect any members to the Canadian Parliament in the years before World War I, nevertheless the Socialist Party of Canada was able to win elections in the provincial legislatures in Alberta and Manitoba. In 1911 a second democratic socialist group was founded, the Social Democratic Party of Canada. Shortly thereafter it joined the Second International, something that the older and more radical Socialist Party of Canada refused to do as long as the decidedly nonradical British and Australian labor parties were members.

During World War I and the period following, the Canadian socialist movement gave much attention to the idea of building One Big Union, a syndicalist idea popularized by the Industrial Workers of the World (IWW) especially in the wake of the general strike in Winnipeg in 1920. Various labor parties also sprang up in parts of Canada during this period and were able to win elections to provincial legislatures. With the support of the United Farmers of Ontario, one such group, the Canadian Labour Party, sent its first candidate, Angus McDonald, to the Canadian Parliament in April 1920. In 1921 the Labour Party of Winnipeg Center, Manitoba, elected to the federal Parliament John Shaver Woodsworth (1874–1942) the leader of the Canadian Labour Party movement in the 1920s and 1930s. In addition to various socialist and labor parties winning elective office in Canada in these years, the communists began to form their own groups in Canada in 1920 and the following year united to form the Communist Party of Canada, which was soon banned by the government.

What was clearly needed was a uniting of the various socialist and labor parties operating

in Canada in the interwar years. To this purpose, labor and farm leaders met in Calgary in 1932 to form the Cooperative Commonwealth Federation (CCF). The same had been tried and is still being tried in the United States—so far unsuccessfully—where many labor leaders remain tied to the Democratic Party and the capitalist system. However, the Canadians apparently had no such ties. At the CCF's first convention in Regina, Saskatchewan, it adopted a socialist platform calling for public ownership of industrial monopolies operating against the public interest and for an independent political party. The CCF core was a group of parliamentary members led by J. S. Woodsworth, already dubbed the "Ginger Group" (another way of calling them the Reds) because of their left-wing stands on social issues.

The CCF grew steadily in the years before World War II, electing 8 members to Parliament by 1940. In 1942 CCF member Joseph Noseworthy was able to defeat the former prime minister and leader of the Conservative Party, Arthur Meighan, for one of Toronto's parliamentary seats. By the following year, the CCF had elected 69 members to various provincial legislatures and were the official opposition in four provinces. Then in 1944, for the first time, the CCF was able to win a majority in a provincial legislature, and Saskatchewan became Canada's first province with a socialist government, electing T. C. Douglas (1904–1986), a former minister and member of Parliament, as provincial prime minister. Whereas the Socialist Party, USA, was going into decline in these years, the CCF was forging ahead, something perplexing and yet an inspiration to socialists in the United States. The CCF continued to thrive in the decades that followed and spearheaded important legislation, including comprehensive health insurance.

■ Introduction: Fascism

Fascism is a sociopolitical philosophy that originated in southern and central Europe in the years immediately following World War I and grew into a mass political movement. Fascist regimes eventually took power in some countries, most notably Italy, Germany, Japan, and Spain, and it was the aggressive expansionism of fascist nations that brought about the conflicts that eventually culminated in World War II.

The term “fascism” was used in 1919 by Benito Mussolini in Italy to name his political party, which stood for a combination of socialist and nationalist policies. The term refers to the ancient Roman icon of an ax blade affixed to a bundle of sticks, or *fascies*, that make the axe unbreakable. This symbolized the power of a completely unified state. In Germany at the same time, a new party, the Nationalsozialistische Deutsche Arbeiterpartei (National Socialist German Workers Party, NSDAP), or Nazi Party, was emerging as well, with similar notions of unity, struggle, and exclusive nationalism.

Though fascist ideology draws on a number of political and philosophical traditions (such as authoritarianism, syndicalism, and anti-Semitism), its origins are most closely associated with conditions in Europe at the end of World War I. A sense of national disappointment and victimization was common to nearly all nations that produced fascist regimes or significant fascist parties. This sense of national humiliation was then exacerbated by serious economic downturns in the interwar years. The social and economic demands of World War I placed exceptional pressures on nations like Germany, Italy,

and Japan, which were only partially modernized. The early 1920s produced serious slumps with the termination of wartime production, and later the consequences of the Wall Street crash of 1929 produced depression conditions and massive unemployment. With the seeming collapse of capitalism and the apparent inability of liberal-democratic regimes to deal with it, these conditions produced a significant advance for the Marxist Left. This perceived threat to private property in turn produced an opportunity for fascists to appear as the protectors of property and order.

The German populace after the war to a great extent rejected the idea that German troops had been militarily defeated. No combat had taken place on German soil, and the military command had not communicated the seriousness of the German military situation. Therefore, when the military government abdicated and set up a democratic republic led by the German Socialist Party (SPD), it was the new government that was blamed for surrender and the signing of the Treaty of Versailles. The Treaty of Versailles, signed at the conclusion of the Paris Peace Conference, explicitly placed the blame for World War I on Germany, demanded significant reparations payments (in money and resources), and limited the size of the German military to a token force. In the years that followed, Germany's new republican government struggled to deal with the economic difficulties of the worldwide slump. Germany suffered through hyperinflation in 1923 and then disastrous unemployment in the early 1930s, all of which discredited the liberal regime and produced fertile ground for Nazism.

Italy had joined the Allies in World War I based upon guarantees of territorial expansion in the secret Treaty of London (1915). However, after the termination of the war, Woodrow Wilson's principles of diplomatic openness and self-determination for ethnic peoples ruled out Italy's territorial expansion. Vittorio Emanuele Orlando, the Italian prime minister, eventually walked out of the conference. This failure caused the collapse of his government and produced a wave of reactions, including Gabrielle D'Annunzio's occupation of the port city of Fiume and Mussolini's Fascist Party violence.

In Italy as elsewhere in Europe, Marxist political movements gained great momentum after the success of the Russian Revolution and as a reaction to diminishing conditions for workers. Especially in Italy, this resulted in a wave of strikes and factory occupations. Mussolini's Fascist Party, like the Nazi Party in Germany, used the often unemployed demobilized soldiers to form private uniformed paramilitary units. Mussolini's "blackshirts" used violence to combat strikes, intimidate Socialist Party leaders, and burn the offices of socialist newspapers. This violence was not confronted by the weak liberal state, and the fascists were partially financed by the business community, who appreciated the suppression of the labor Left regardless of the means. After gaining a small presence in the Italian Parliament, the fascists were able to gain power by constitutional means in 1922, when the intimidated Italian king, with few alternatives, called upon Mussolini to form a government. Mussolini would rule Italy until his fall in 1943 as a result of the Allied invasion of Italy.

In Germany, Adolf Hitler had taken charge of the Nazi Party by 1923 and staged an armed coup now known as the Beer Hall Putsch. The coup failed, and Hitler was arrested but was given a light sentence by an unreformed judiciary. During his nine months in prison he wrote *Mein Kampf* (*My Struggle*), which outlined his conception of a world defined by the struggle between racial groups and was a manifesto for the Nazi Party. By 1933 as Germany suffered through terrible economic depression, the Nazi Party claimed a significant number of seats in the Reichstag, and Hitler was named chancellor under President Paul von Hindenburg. Hinden-

burg soon died, and Hitler managed to consolidate his power into a dictatorship. As did Mussolini in Italy, Hitler violently eliminated all political opposition. He ruled Germany without significant resistance until that nation's defeat in World War II. Hitler produced an economic recovery based upon a massive rearmament program that prepared Germany for a war of territorial expansion and enjoyed great popularity among the German people. His radically racist views resulted in progressively harsher legislation that barred Jews from government, business, and cultural life and would eventually lead to their mass execution in concentration camps during World War II.

Italy and Germany are the most recognizable examples of fascist regimes, but fascist or fascist-inspired governments appeared all over Europe during the interwar years. In Portugal, a military coup in 1926 eventually placed Antonio de Oliveira Salazar in charge in 1928. Salazar's regime included some important fascist practices but suppressed the more radical fascist parties. Fascist-inspired regimes also took power in Austria (1934–1938) under Engelbert Dolfuss and (after his assassination, Kurt Schuschnigg) in Hungary (1919–1944) under Admiral Miklos Horthy.

The longest lasting of the explicitly fascist regimes was that of Francisco Franco in Spain. After the establishment of the Second Republic in 1931, Spain's government swung dramatically to the Left as a result of the Popular Front in the 1936 elections. Members of the Falange, Spain's most important fascist party, were arrested, and important members of the military were dismissed. General Franco led a military revolution to overthrow the government that resulted in the Spanish Civil War (1936–1939). Franco's movement was aided directly by both Italy and Germany, while the democratic governments of Britain and France provided no help to the Republican forces. The Republic eventually accepted the aid of the Soviet Union. Franco's Nationalists won the war and used the Falange party apparatus to rule the nation, violently exterminating political opposition. Franco aided Italy and Germany during World War II but remained neutral. After the defeat of the Axis Powers, Franco gradually reduced the overtly

fascist characteristics of his government, but Spain remained a military dictatorship until Franco's death in 1975.

Less successful fascist movements developed all over Europe and throughout the world during this period. Significant movements developed in France (Action Française), Great Britain (British Union of Fascists), and Belgium (Rexist Movement). These movements made important social and political impacts but never seriously threatened to take power.

In 1935 fascist Italy invaded the nation of Abyssinia (modern-day Ethiopia) despite loud protests from the League of Nations, to which both Italy and Abyssinia belonged. Italy eventually defeated the Abyssinians by means of a brutal strategy that included the use of poison gas on military and civilian targets. This began the process of aggressive and rapacious imperial expansion by the fascist powers. Soon after, Hitler reoccupied the Rhineland in 1936 and then annexed Austria in 1938. Though these were outrageous breaches of the League of Nations and the Treaty of Versailles, no other powers (most importantly France and Britain) moved to stop them, instead using diplomacy to try to reach a negotiated settlement. This strategy is known today as the policy of appeasement. Later, in 1938, Hitler made clear his intention to move into Czechoslovakia to reclaim the German-speaking area of the Sudetenland. France and Great Britain negotiated desperately to avoid a major conflict and eventually reached an agreement that gave the Sudetenland to Germany in exchange for peace. Germany soon occupied the rest of Czechoslovakia and in September of 1939 invaded Poland. At this point appeasement was seen to be a failed policy, and war broke out. Through the first years of the war, Nazi Germany invaded and occupied in succession Poland, Denmark, Norway, Holland, Belgium, and France. In France, the northern part of the country remained under direct Nazi control, but in the south a French fascist-style government was established with its capital at Vichy. After Germany's invasion of the Soviet Union and the entry of the United States into World War II in 1941, the war gradually but inexorably led to the fall of fascist regimes and the material devastation of Germany, Italy, and Japan by 1945.

Even before the end of World War II, fascism had been essentially discredited as a political system. Great lengths were taken by occupying Allied Powers to ensure the rebuilding of Europe, the denazification of Germany, and the reconstruction of Japan to both guard against the development of communism and to suppress the reemergence of fascism. However, fascist-inspired regimes did develop in the postwar period. In Argentina, Juan Peron (1946–1955) openly admired and communicated with European fascist powers and established what is often referred to as a pseudofascist regime. In South Africa, the Afrikaner Nationalist Party took power in 1948 and was led by many open fascists and fervent admirers of Nazism. Though the regime had no single mythic leader and retained a parliamentary structure, its radical policy of apartheid (legal racial separation and suppression) has led many to see it as a particular variant of fascism. Other semifascist governments emerged in places such as Guatemala, Rhodesia, and Iran. Most recently, a case can be made for the Slobodan Milosevic regime in Serbian Yugoslavia, which openly advocated exclusive nationalism and ethnic cleansing. Most neofascist movements today are marginalized fringe groups of the extreme Right that attract members most concerned with simple race hatred and anti-immigration policies.

The Ideology of Fascism

The characteristics, values, and priorities of fascist movements were highly particular, with various combinations of policies and sometimes contradictory notions. Few scholars agree on a single description of fascism, and its very definition remains to this day the most controversial

➤ GERMAN FATHERLAND PARTY

The German Fatherland Party (Vaterlandspartei) was formed in 1917 in response to efforts in the Reichstag (German parliament) to formulate a peace proposal with the Allies in World War I. Composed mostly of right-wing military officers and supporters of the German Supreme Command (military dictatorship), the Fatherland Party was specifically focused on continuing the war effort. The Supreme Command held a near-dictatorial grip over the state in mobilizing for war. Led by Paul von Hindenburg and Erich Ludendorff, the Supreme Command eagerly accepted the support of the rapidly expanding Fatherland Party. Along with supporting the Supreme Command's annexationist policies on both fronts, the Fatherland Party also supported the dictatorial hold that the current militarist regime had over the economy and society in addition to advocating the impotence of the parliament. In the interwar period former members of the Fatherland Party, such as Wolfgang Kapp and Anton Drexler, continued to support such views. Kapp led a coup against the German government in the famous failed Kapp Putsch (coup) of 1920. In 1919 Drexler formed the German Workers' Party, which eventually became the German National Socialist Workers' Party (NSDAP).

—Abraham O. Mendoza

debate on the subject. Making the task even more difficult is the fact that fascist dictators, such as Benito Mussolini and Adolf Hitler, often sneered at ideologies and programs, insisting that pragmatic action alone was important. Mussolini was very open about his lack of a concrete ideology early in his political life, describing fascism merely as a series of policies designed to gain power. Despite this, the combined actions and writings of the various fascist movements provide areas that stand out as characteristic and can be assembled into a generalized picture of fascist ideology.

Fascist ideology begins with the conception of the state as the supreme entity to which all other areas must be subordinated. This is a rejection of the Enlightenment philosophies of the priority of individual liberties, individual worthiness, and equality of citizens before an impartial

law. In fascist ideology, individual rights are explicitly subject to the will of the state.

The definition of precisely what constitutes a nation is problematic. During the early twentieth century, nation was typically viewed as the composite of traditional ethnicities, language, and culture of a political state. This was often seen by fascist leaders as the justification for expanding their political states to include those who shared their culture but had been left outside of the new boundaries as a result of the reorganization of Europe after World War I. Citizens of a state, however, who were not seen as part of the traditional ethnicities, were considered foreign or impure elements. Many of these groups were subject to oppression, expulsion, and even extermination in order to preserve national integrity.

Politically, fascist movements were led by political parties, typically with a single charismatic leader who was seen as the embodiment of the nation. This leader was perceived as possessing the vision and the will to lead the nation to a so-called mythical rebirth as a dominant power. Fascist movements were nearly always antiparliamentarian, violently denouncing the impracticability of multiple parties vying for influence. Fascist regimes, once in power, typically moved to eliminate opposition parties, often through violence, and retained parliaments merely for the sake of appearance. Fascist leaders sometimes used plebiscites to legitimize themselves, but these were hardly trustworthy given the use of violent coercion and the lack of voting alternatives.

Another characteristic of fascist ideology was the militarization of political culture. Fascist political parties often used groups of uniformed paramilitary squads to intimidate and defeat political opposition as well as to maintain internal order. Violence was generally celebrated in fascist doctrine because a great nation, it was asserted, could only arise out of struggle. This extended to the practice of mass political meetings and rallies, which were often regimented and ritualized affairs. They typically included marches, uniforms, symbols, and insignia.

In terms of economic issues, fascism was, first of all, concerned with maintaining the private ownership of the means of production but

under state direction. Older Marxist interpretations saw fascism as merely a tool of the industrial bourgeoisie and the defense of that class by violent means. More recent scholarship has demonstrated that although some fascist regimes accepted financial help from industry in the early stages, after taking power fascist governments instead dictated terms to the business community.

One of the most common economic policies of fascism was the reorganization of governmental infrastructure into corporations. First attempted in Italy, these corporations were composed of business leaders, technicians, labor representatives, and government agents. These would monitor and regulate entire industries, including prices, labor conditions, production levels, and wages. The corporative model was highly attractive to most fascist movements during periods of economic depression. Corporations figured prominently in the regimes of António de Oliveira (Portugal) and Francisco Franco (Spain) and in the programs of many of the movements that never took power. In both Italy and Germany, however, the corporative structure produced little in the way of industrial progress and eventually became a mere instrument of government economic policy. Labor suffered severely under the corporative model. Having lost the ability to strike effectively, labor organizations became increasingly marginalized and irrelevant.

Many fascist movements also aspired to create self-sufficient economies. In Germany, Hitler created the Four-Year Plan, led by Hermann Göring, that was designed to make the nation self-sufficient in terms of all military-sensitive materials. In Italy, Mussolini declared autarky (an economy that does no trade with the outside world) to be the number one economic priority as economic sanctions were imposed by the League of Nations after Italy's invasion of Abyssinia. Franco's Spain followed suit, attempting to reach economic self-sufficiency in the 1940s. This pursuit of economic independence reflected the fascist desire for an independent political agenda. It was also a contributing factor in the imperial expansion of fascist nations as they attempted to obtain natural resources, labor, and markets to construct economies large and rich enough to be self-sufficient. Autarky was never

achieved by any fascist power, and the attempts often produced economically disastrous results.

Some scholars have seen the pursuit of a closed, self-sufficient economic system as the economic counterpart to the exclusive racial attitudes of fascist ideology. Given the exclusive nationalism of fascist regimes, it followed that foreign elements were generally weeded out. Nazi Germany was the most fanatical in this respect, reflecting Hitler's obsession with a racially pure German citizenry. He conceived the nation in terms of a gene pool and saw any "impurities" as harmful threats to national integrity. Nazi ideology was especially concerned with the Jews. In Germany, laws were passed that excluded Jews from government, business, and cultural participation. Eventually, Jews were forced to wear humiliating identification and were segregated, persecuted, and expelled from the country. Finally, during World War II, Nazi Germany embarked on a radical project to exterminate the Jews through an industrialized system of death camps, known today as the Holocaust. Six million Jews, as well as many other groups such as the Gypsies, were murdered in this way.

In Italy, there was relatively little formalized racial legislation until the invasion of Abyssinia. After 1935, however, Mussolini passed legislation against Africans and against their intermarriage with Italians. After his alliance with Hitler in the late 1930s, Italy also passed anti-Semitic legislation. Some degree of anti-Semitism was common to nearly all fascist movements, which saw the world in racial terms, like Hitler, and saw Jewish investors and financiers as involved in a conspiracy to control the world economy.

In terms of religion, fascists were divided in their attitudes. Hitler and Mussolini both saw religion in pragmatic terms and reached agreements with the Roman Catholic Church for reasons of mass appeal. Their real aims, however, were to create a kind of political religion, and they kept the Church well out of politics. In more conservative fascist regimes such as Spain, Portugal, and Austria, fascist leaders saw the Church as an important pillar of the state and allowed it a modest influence on policy. This more integrative approach to religion by conservative regimes is sometimes referred to as clerical fascism.

Finally, fascist ideology was vague about the role of women, but most regimes were discriminatory. Fascist culture was typically very masculine, celebrating virility, strength, domination, and violence. Women's roles were mostly seen in the idealized terms of motherhood. Women were seen as crucial to producing and nurturing new, vital, and energetic generations capable of fighting and winning in the world struggle. There were medals and awards created in Germany and Italy, for instance, that decorated the best examples of fascist motherhood. Despite this, many women were attracted to fascism, and most movements had special women's sections with their own marches, uniforms, and insignia.

Fascism in Germany

German fascism is better known to the world as Nazism and is closely associated with the name of Adolf Hitler (1889–1945). Like its counterparts in Italy and elsewhere in Europe, Nazism was a product of the severe social dislocations experienced after World War I and found a ready audience in the urban and rural middle classes. In Germany, these highly nationalistic classes were shocked and frightened by the overthrow of the German monarchy in 1918 and the inexplicable German defeat in World War I. Furthermore, this group was anxious about the loss of their savings in the hyperinflation of 1923, the growth of Leftist trade unions and socialist parties, and the perceived anarchy of democratic politics. As a result of this collective angst, they desperately looked for someone who could save them from their economic and political woes. Hitler's racism, antisocialism, anticommunism, anti-industrialism, xenophobia, and antidemocratic politics appealed to these classes. He promised to save Germany and the Germans from enemies at home and abroad. As time would show, however, his plans would bring

about another world war, the deaths of tens of millions of people, and the complete destruction of the Germany they all knew.

The full name of the Nazi Party was the Nationalsozialistische Deutsche Arbeiterpartei (National Socialist German Workers' Party, NSDAP). The so-called socialism that Hitler espoused was the comradeship of the front in World War I. It was an experience, he believed, that destroyed class barriers and made everyone German. The movement was national because it was the solidarity against foreign powers that would prevent the disintegration of the German nation. Hitler's workers were anyone who earned a living, thus wage and salaried employees. In fact, the wage-earning German working class had not supported the Nazis before Hitler came to power in 1933 but instead backed the socialist and communist movements. As its leader, Hitler hoped to create a *Volksgemeinschaft* (a folk community) of equal German citizens. The community would be based on race, and membership would be limited to those of the Aryan race. Such a *Volksgemeinschaft* would first have to be purged of the alleged traitorous or unnational elements, which for Hitler meant the communists, socialists, trade unionists, Jews, and Gypsies. As he made clear in his book *Mein Kampf* (*My Struggle*), he believed that the struggle between the races was the key to history, and he planned to lead Germans in a neo-Darwinian life-and-death struggle for living space (*Lebensraum*) against the Jews and Slavs of eastern Europe. Without living space, the Germans, whom Hitler believed were the world's premier Aryan race, would lose this racial battle and be extinguished as a people. To fight this war successfully, Hitler argued that Germany would have to become a dictatorship, a *Führerstaat* (leadership state), with him as the *Führer* (leader).

The Great Depression gave Hitler the opportunity to rule Germany. The economic, social, and political crises caused by mass unemployment and business failures created panic among the middle classes. Surprisingly, unemployed workers did not vote for Hitler, but the middle classes did. In the July 1932 parliamentary elections, the NSDAP garnered 31 percent of the popular vote. Although the party lost votes in the subsequent November 1932 election and

never became a majority party in Weimar Germany, it was the only right-wing party with a mass base of support. As such, the conservative notables around German president Paul von Hindenburg (1847–1934) urged him to appoint Hitler as chancellor (prime minister) of Germany. Since 1930, Germany had been a constitutional dictatorship in a state of emergency where the elected president was able to pass laws and appoint governments without the approval of the Reichstag (parliament). Using this authority, von Hindenburg appointed Hitler as chancellor on January 30, 1933.

Hitler quickly capitalized on the opportunity afforded him by his appointment to bring about a *Machtergreifung*, or seizure of power. He attacked and banned the Kommunistische Partei Deutschlands (Communist Party of Germany), held new elections in March 1933 during a reign of terror, and had the new parliament pass the Enabling Act that gave him dictatorial powers for four years. He methodically eliminated all constitutional and organizational obstacles to a dictatorship while at the same time preserving the facade of legality. He used the Enabling Act to ban trade unions, outlaw all other political parties, create a one-party state, dissolve the federal structure of the government, purge the civil service, and terrorize regime opponents whom he ordered sent to concentration camps, whose first inmates were trade unionists, socialists, and communists. After von Hindenburg's death in 1934, nothing stood in the way of the Nazi regime's ruthlessness and brutality, especially once the press, radio, and film industries had been synchronized with the regime's propaganda apparatus under Josef Goebbels (1897–1945).

Once Hitler's left-wing opponents and their organizations had been liquidated, he turned his attention to getting people back to work and strengthening Germany's armed forces. His rearmament drive lifted Germany out of the Great Depression by 1936 and was a needed component of his drive for living space. Without a modern-equipped army, he could not conquer his neighbors' territory—Poland and the Soviet Union—where he believed German living space existed. Hitler argued that the Slavs were an inferior race and deserved to lose their right to live and occupy good agricultural land on which

➤ GREGOR STRASSER AND NATIONAL SOCIALISM

Gregor Strasser (1892–1934) was a member of the top ranks of the leadership of the German National Socialist Workers' Party (NSDAP), also known as the Nazi Party. After World War I, Strasser was heavily involved with right-wing paramilitary groups known collectively as the Freikorps and became associated with the Nazis in 1921. He was also involved with Adolf Hitler's botched Beer Hall Putsch of 1923, a plot to take over the Bavarian state government in Munich. Strasser, like Hitler, was sentenced to prison for these actions. Upon Strasser's speedy release, he was instrumental in the reorganization of the national structure of the party organization, responsible for transforming the NSDAP from a fringe splinter party into a national party capable of winning seats in the Reichstag (national legislature) and state houses. Unlike Hitler, whose ideological beliefs were strongly anti-Semitic and anti-Marxist, Strasser advocated social and economic reforms more akin to Marxism, which put him at the Left of the party. Ultimately, as Hitler secured his domination of the NSDAP, Strasser's profile as party leader lessened from the late 1920s to the early 1930s. After Hitler's rise to power in 1933, Strasser remained high in the party leadership but was nonetheless deemed a liability, as conservatives flirted with him and not the more radical Hitler in an effort to break up the power of the NSDAP in 1932. In 1934 during the *Nacht der langen Messer* (Night of the Long Knives), Strasser was captured and assassinated by the *Sturmabteilung* (SA), a Nazi paramilitary organization, under Hitler's orders.

—Abraham O. Mendoza

he hoped to settle sturdy German peasants. Besides Slavs, Jews were the other major ethnic group pathologically hated by Hitler, who saw in both of them the antithesis to German civilization. While the Slavs would be dealt with later when war broke out in 1939, the Nazis began their racial attacks against the Jews soon after they took power. Most Jews were expelled from the civil service in 1933 and lost their citizenship rights in 1935. In 1938 Jewish shops were destroyed across Germany in the *Reichskristallnacht* (Night of Broken Glass). Once war started in September 1939, the German Army (*Heer*)

and the Security Forces (Schutzstaffel) began rounding up Slavs and Jews in Poland, many of whom were pressed into forced labor, put in concentration camps, or murdered. Hitler's race war began in earnest with the German invasion of the Soviet Union in June 1941. There, hundreds of thousands of Russians and other peoples were murdered, often for being communists, while millions starved to death. Meanwhile in Germany and Poland, death camps such as Birkenau began the mass murder of Jews in the spring of 1942. By the time World War II was over, approximately 6 million Jews had been killed along with 11.5 million Soviet civilians (mostly Slavs) and more than 2 million Polish civilians. Total Polish and Soviet casualties, including soldiers, were nearly 29 million people, which included 4 million Jews.

When Hitler launched his war for living space in 1939, he meant to overturn the international order of his day and make Germany the strongest nation on the European continent. It was more than a conventional war, however: it was an imperialist war, a race war, and a war against communist collectivism. Nazism was a form of fascism distinguished by the sheer scale and scope of its brutality, its racial ideology, and its expansionist drive, all of which turned on their creators and buried them by 1945 in the broken cities of the Fatherland.

Fascism in Italy

Fascism originated in Italy out of the political party activity of Benito Mussolini in the years immediately following World War I. Mussolini ruled Italy from 1922 until he was deposed in

1943 during World War II. During Mussolini's reign an Italian fascist philosophy took shape, and he was able to consolidate his power into a dictatorship. He produced the perception of an economically sound society with strict order, efficiency, and modernization. Fascist Italy invaded Abyssinia in 1935, alienating other democratic powers, and eventually formed an alliance with Nazi Germany. This led Italy to enter World War II on the side of Germany, whereupon its illusion of modernized efficiency was exposed as fiction. Italy was defeated time and again in combat and suffered invasions from both the Allies and Nazi Germany. Mussolini was deposed in 1943, and Italy was left materially devastated after the war.

Benito Mussolini was born in 1883 to relatively poor parents, who brought him up in the tradition of revolutionary socialism. In his early adult life he moved around Italy and Switzerland, taking jobs as a teacher and writer and consistently getting into trouble for his temper and violence. He joined the Socialist Party and was eventually given the post of editor of its newspaper *Avanti!* This was a notable responsibility given his age. In *Avanti!* he continued to promote a violent revolution to overthrow the state and capitalism. In the years leading to World War I, however, he made clear his opinion that Italy should show its strength in the war, as great nations, he asserted, could only be forged out of struggle. This was in direct opposition to the Socialist Party program, and he was soon expelled from the party. He thereupon founded his own newspaper, *Il Popolo d'Italia*, (*The Italian People*), and his own political party, which he named the Fasci di Combattimento, in 1919 that later became the Partito Nazionale Fascista (National Fascist Party) in 1921.

During 1919–1922 the Italian people suffered greatly. Economically, the end of wartime production brought unemployment and lower wages, which led to a wave of strikes and factory occupations by workers, mostly of the Socialist Left. At the Paris Peace Conference, Italy found that it could gain none of the territory it had been promised in the Treaty of London, and the Italian prime minister, Vittorio Emanuele Orlando, returned home empty-handed. This triggered the collapse of his government, and a succession of

weak and ineffective administrations followed. As it turns out, these later administrations were ill-equipped to deal with the difficulties that Italy faced. In the elections, the Socialist Party gained a significant number of seats, becoming Italy's majority party. This produced a great deal of anxiety among those in the middle classes who worried about the elimination of private property and the prospects of a violent revolution.

All of these conditions provided an opportunity for Mussolini's fascists to appear as the protectors of private property and internal order. Mussolini had assembled a private uniformed army mostly of demobilized soldiers who could find no work. These *squadristi* (action squads) broke up strikes, violently attacked Socialist leaders, and destroyed the offices of the Socialist Party and the press. In the rural areas, this was especially appreciated by large landowners who wanted to keep wages low among the agricultural day laborers. Industry and large landowners contributed financially to the movement, providing some of its membership during these early years.

By 1922 the fascists had gained a small number of seats in the Italian Parliament but were by no means a majority. The government of Francesco Nitti collapsed that year, and widespread violence was feared. The king, fearing violent uprisings and suspecting that the army might defect to Mussolini, called upon him to form a government. Mussolini thus took the reins of power by constitutional means but immediately afterward orchestrated a massive march of fascist squads known as the March on Rome to create the illusion of a forceful seizure of power.

In the early years of Mussolini's regime, there was little in the way of a political program beyond restructuring the government and eliminating political opposition. In 1924 the Socialist Giacomo Matteotti was murdered by Fascist Party squads presumably at the suggestion of Mussolini. Parliament eventually became merely a Fascist Party assembly, with Mussolini, now known as Il Duce, as head of the Grand Council of Fascism. The Grand Council became a tool for Mussolini, who had exclusive rights to summon it and decide which issues it would review.

Economically, Mussolini restructured Italian trade, beginning in 1927, on the corporative model. Corporations were composed of manag-

➤ GIOVANNI GENTILE, *A DOCTRINE OF FASCISM* (1932)

Italian philosopher Giovanni Gentile (1875–1944) devised the philosophical basis for fascism, the political system implemented by Benito Mussolini in 1922 in Italy. Gentile, known as “the Philosopher of Fascism,” has been credited with the writing of *A Doctrine of Fascism* (1932), although the work was signed by Benito Mussolini. In this work, Gentile described the central tenets of Italian fascism, necessary for the creation of the Italian fascist state. These were the institution of compulsory state corporatism, the abolition of the parliamentary system (and all forms of hated liberalism), and the implementation of economic autarky (self-sufficient national-centered economy with little to no international trade). He also wrote the *Manifesto of the Italian Fascist Intellectuals*, signed by many members of the Italian intelligentsia including playwright Luigi Pirandello. Gentile also served the Italian fascist state as minister of education and member of the Fascist Grand Council. He remained under Mussolini with the establishment of the Republic of Salò. Ultimately, Gentile was murdered by antifascist partisans in Florence in 1944.

—Abraham O. Mendoza

ers, technicians, labor, and government representatives. Their purpose was to monitor and regulate entire industries based on the belief that the needs of the state and national unity transcended class. Trade unions, even the historically fascist trade unions, were eliminated in favor of the National Council of Corporations, established in 1930. The corporate structure, however, produced very little industrial progress, mostly choking the economy with bureaucracy and handling issues on an inconsistent and ad hoc basis. Labor interests were crushed as their organizations disappeared, while private ownership remained in place. In 1926 Mussolini decided to arrest the rapid decline of the lira and fixed it to the gold standard. This created an adverse economic recession as exports became far more expensive. Mussolini cared little for the economic consequences; however, the value of the lira was a matter of national prestige.

On the heels of smaller imperial expeditions such as annexing the island of Corfu, in 1935 Mussolini made the decision to invade the Kingdom of Abyssinia (present-day Ethiopia). This was partly aimed at gaining additional natural resources, labor, markets, and farmland for Italian settlers. It was also clearly done as a display of strength and national glory. It was a costly decision, as Abyssinia yielded little in the way of economic assets, and Italy's blatant aggression, including the use of poison gas, was denounced by most of the democratic world. The League of Nations imposed economic sanctions on Italy, whereupon Mussolini campaigned for an intensified policy of economic autarky, which further inhibited Italy's industry.

Having alienated most of the democratic powers, Italy eventually formed an alliance with Nazi Germany. Mussolini visited Germany in 1936, and soon after both Italy and Germany provided direct support to Francisco Franco's Nationalist forces in the Spanish Civil War. Franco's victory as well as Mussolini's role in the diplomatic crisis over Czechoslovakia in 1938 marked the apex of the Italian dictator's popularity on the world stage, but in reality Italy was fast becoming beholden to Germany. After the decisive success of German forces in the early months of World War II, Mussolini entered the war on the Axis side in order not to miss out on the spoils of victory. The demands of total war, however, starkly exposed the limitations of Italy's backward industrial economy and its inept military. The poorly equipped Italians suffered many defeats, more than once forcing German troops to come to their aid.

After the entry of the United States and the Soviet Union into the war in 1941, the Allies advanced deliberately toward victory. In 1943, the year of the Allied invasion of Italy, Mussolini was deposed by members of his own government, arrested, and imprisoned in a mountain fortress. German commando forces, however, came to his aid in a dramatic rescue operation. Hitler then set up Mussolini in a tiny puppet government at Salò in northern Italy. As German forces retreated and Allied forces advanced, Mussolini attempted to evacuate but was discovered by a group of Italian Leftists and shot along with his mistress. Their bodies were hanged and dismembered by the crowd.

After World War II a neofascist party, the MSI (*Movimento Sociale Italiano* or Italian Social Movement), persisted in Italy and remained loyal to the principles of Mussolini's fascist program. It was not very popular and did not enjoy legal status, as it refused to recognize the new Republic of Italy.

Fascism in Japan

The term “fascism,” when related to Japan, is most often used to describe its ultranationalist, militarist, and expansionist regimes of the 1930s that lasted until the end of World War II. Some apply the term to the early period of the Showa Restoration (Emperor Hirohito's reign) from 1926 to 1945. Although Japan in this period shared many similarities with European fascist regimes, there were also many differences, and so there remains much debate about applying the term “fascism” to Japan.

The roots of modern Japanese nationalism go back to the beginning of the Meiji Restoration, which began in 1868. A process began then, with the accession of Emperor Mutsuhito (the Meiji Emperor), to consolidate power in the hands of the emperor and to embark upon modernization. To the Japanese, modernization included constitutionalism, industrialization, a well-trained and modernized military, and the formal abolition of feudalism. The combination of these efforts brought Japan rapid economic growth and a more unified national identity. The Constitution of 1889 established a Western-style parliament, but the emperor retained significant power, including the power to call and dismiss parliament.

To help in the process of modernization and the social upheavals it inevitably produced, mod-

ernizers proposed policies and reintroduced ideas associated with Japan's ancient and feudal past. There was a revival of the Shinto religion and Confucianism. There were also notions regarding the divinity of the emperor as well as the concept of *Kodushugisha* (Imperial Way), which suggested that Japan had a divine mission to bring the entire world under its rule. Modernization and industrialization brought with them social upheaval and, eventually, social reaction. Labor movements and even a small Communist Party appeared after 1900, which threatened the nationalist Right. From this point, Japan implemented a series of policies to suppress these movements, culminating in the Peace Preservation Laws of 1928 that formed a police force to root out "dangerous thoughts." The only progressive social legislation passed during the period was the gradual expansion of the franchise, which granted universal manhood suffrage in 1925. The 1929 Wall Street crash, however, sent the Japanese economy reeling, especially with its dependence on exports. This served to discredit Japanese politicians, who were seen as being unable to deal with the crisis while serving their own interests at the expense of the nation.

Certain elements of the military were especially convinced of the worthlessness of Japan's party politics. Through 1930–1931, Japan endured a wave of violent confrontations and assassinations of top-level officials, as the Young Officers defied the government. The Young Officers' ideas gelled easily with the group of secret right-wing societies that had developed. The latter rejected parliamentary government and demanded a return to authoritarian Japanese traditions and also advocated racial purity. Much like fascist parties in Europe, these societies took to the streets and used violence and terrorist acts to intimidate their opponents.

In September 1931 the Manchurian Incident occurred in which the Japanese military on the continent determined that a train had been bombed by Chinese resistance forces. This prompted the military to move into a full occupation of all of Manchuria. Despite the objections of the Japanese parliament, military officers went ahead with their occupation. For the next five years a power struggle developed between military officers, who constantly tried

➤ THE GREAT KANTO EARTHQUAKE OF 1923

The Great Kanto Earthquake struck Japan on September 1, 1923. The 8.3 magnitude earthquake devastated the Kanto plain, the densely populated, industrial heart of Japan. Tokyo and Yokohama lay in ruin, rendering the vast majority of their inhabitants homeless and bringing the economy to a halt. Even after the four to ten minutes it took for the earthquake to subside, the damage to Japan was further amplified by more than 800 aftershocks as well as tsunamis along the coast and widespread fires that swept across the rubble. The death toll is estimated to be 143,000 from the earthquake and resulting fires. However, the repercussions did not end there. Rumors began to spread that Korean residents were using the disaster to loot and rob. In response to these rumors, Japanese vigilante groups began to form and took the law into their own hands, identifying, beating, and often killing Koreans. It is estimated that as many as 10,000 Korean residents were killed as a result of vigilante violence. Although the Japanese government condemned the violence, it too used the chaos to its own advantage. Fearful that the state of disorder could prove a threat to its power, the Japanese government began to round up and execute prominent socialist and anarchist leaders. The most notable instance was the highly publicized Amakasu Incident. The radical Japanese feminist Sakae Osugi, her anarchist husband, and their six-year-old nephew were arrested by the military police and beaten to death. The state of panic and chaos in the aftermath of the Great Kanto Earthquake revealed the presence of a number of traits that would come to define fascism in Japan. The distrust and mistreatment of their neighbors and the government's silencing of political dissidents became all too prevalent in the buildup to World War II.

to get the government to move to marshal law, and the parliament, which tried to control imperial expansion. In July 1937 Japanese and Chinese troops again skirmished, which served to renew the war between Japan and China. Japan continued to occupy increasingly larger areas of Chinese territory right into World War II.

Japan joined Nazi Germany in a wartime alliance in 1940, as Germany experienced consistent success in its war in Europe. While Japan

was friendly with the fascist powers, it did not itself have a dictatorial government but instead maintained its parliament and constitution. In 1940, however, the Konoe Fumimaro government created the Imperial Rule Assistance Association, which consolidated all parties into one organization. In late 1940 the Japanese moved into Indochina, and when the United States was unable to negotiate a settlement, the North American nation responded with an oil embargo. Although he was willing to leave Indochina, Konoe could reach no agreement with the United States and resigned in October 1941, replaced by his minister for war, General Tojo Hideki.

In December 1941 the Japanese made the decision to bomb the U.S. naval fleet in the port of Pearl Harbor, Hawaii. The attack achieved complete surprise and devastated the U.S. fleet. The Japanese leadership was convinced that recovery and invasion would be far too costly for a weak liberal democracy such as the United States. With this in mind, the Japanese continued their march through East Asia accumulating imperial territory at a very rapid pace and ruling in an extremely dictatorial way. The Philippine Islands fell to Japan in early 1942 followed by Singapore, the Dutch Indies, and Burma. These successes brought Tojo unprecedented popularity, and he began to govern and present himself in a more totalitarian, or fascist, fashion. In 1943, however, Japan began to experience a series of setbacks as the United States resolutely rebuilt its fleet and steamed into the Pacific with the goal of absolute victory. Guadalcanal and the defeat of Japanese carriers at Midway turned the tide of the war in the Pacific, and from that point the U.S. military pursued its deliberate advance toward Japan.

By July 1944 it was clear that Japan was losing the war, and Tojo's government was replaced by that of Koiso Kuniaki. Despite forming a war cabinet with direct links to the military, the United States continued to defeat the Japanese in repeated engagements. In April 1945 U.S. forces landed on Okinawa in the bloodiest battle of the Pacific war and secured the island. The Kuniaki government fell, and the new prime minister, Suzuki Kantaro, unsuccessfully pursued a negotiated settlement to end the war. Having not yet attained absolute victory and facing the possible

necessity of an invasion of Japan, the United States made the decision to drop atomic bombs on Hiroshima and Nagasaki in August 1945. The extraordinary destruction that the bombs inflicted and the looming possibility of Russian entry into the Pacific war pressed the emperor to discuss peace terms with the United States. The United States accepted the single condition of retaining the institution of the emperor (subject to the will of the Japanese people), and Hirohito then immediately pressed for surrender. Military leaders attempted to prevent the news from reaching the Japanese people, and several committed suicide at the dishonor. Despite their efforts, however, the Empire of Japan came to an end with the signature of the surrender documents aboard USS *Missouri* on September 2, 1945.

Fascism Movements in Eastern Europe

Amid the political and economic chaos that followed World War I, eastern Europe developed various fascist movements similar to those developing in interwar Weimar Germany and fascist Italy in the 1920s and the 1930s. However, these movements lacked the momentum and mass appeal that fascism developed in Central Europe. Moreover, fascist groups in Austria, Hungary, Poland, Czechoslovakia, Yugoslavia, and Romania were restrained from seizing power by the authoritarian dictatorships that saw these Far Right groups as too radical and divisive in their rhetoric and ideology. These authoritarian dictatorships, imbued with conservative values, were also reluctant to allow these groups to come into power, given that these were sympathetic to the revisionist foreign policy goals of both Italy and Germany.

The end of World War I resulted in the dissolution of the Habsburg Austro-Hungarian state and in the creation of the new successor national states of Austria, Hungary, and Czechoslovakia. Former Habsburg lands also went to the newly formed states of Poland and Yugoslavia. The attempt to create homogenous national states amid large population exchanges and territory losses resulted in increased xenophobia and resentment of new borders. Political, social, and economic instability within these new states further exacerbated the domestic situation. Suspicions grew of new national minorities protected by international League of Nations treaties, particularly of Jewish populations that were a marginal yet economically preponderant community within eastern Europe.

In the late 1920s and early 1930s both Austria and Czechoslovakia developed fascist movements affiliated with the National Socialist movement in Germany, and these were primarily separatist nationalist organizations that advocated union with Germany. Austria developed a fascist movement aligned with the National Socialist Party (NSDAP) of Germany, working toward the union of Austria with greater Germany. With the accession to power of Adolf Hitler in Germany in 1933, the Austrian Nazi Party became viewed with suspicion by the Catholic authoritarian party in power. While this Austrian Nazi Party was not able to muster a significant voting bloc in Austrian elections, it was nonetheless a threat to Austrian security due to its affiliation with Nazi Germany. The Sudeten Nazi Party of Czechoslovakia, made up primarily of Austrian “Germans,” seeking union with Germany (a country that they, as former Habsburg subjects, were never part of), also were insignificant in Czechoslovakian elections but carried weight given their ties with the Nazis. Both of these movements would be crucial in justifying German annexation of these regions in the late 1930s.

The East European states of Hungary, Yugoslavia, Poland, and Romania also developed fascist movements with close ties to Germany and Italy, but these movements were kept from seizing power by their respective authoritarian regimes. Within Hungary the Arrow Cross movement, which had similar ideological elements with the fascist movements in Germany

Engelbert Dollfuss, chancellor of Austria's authoritarian government, addresses a rally in Vienna, Austria, 1933. (Bettmann/Corbis)

➤ AUTHORITARIANISM IN INTERWAR EUROPE

Authoritarian dictatorships in postwar Europe are often categorized as fascist regimes, but many of these regimes did not possess the same radical ideological goals as fascism in Italy and Germany. While the authoritarian regimes of Francisco Franco in Spain, Admiral Miklos Horthy in Hungary, General Ion Antonescu in Romania, Joseph Pilsudski in Poland, and Dr. Antonio de Oliveira Salazar in Portugal were characterized by conservative, traditionalist values, these regimes often advocated reactionary policies toward communists, socialists, and fascists. And while many of these regimes did sympathize with Germany and Italy on some of their revisionist foreign policies, they did not share radical ideological goals based on anti-Semitism, racial organization of society, or the corporatist organization of society. These regimes were geared toward retaining the conservative institutions of the church, the army, and major landholders, albeit with some policies directed against Jews and socialist (and fascist) agitation. However, these authoritarian regimes did not share the antipathy toward religion and tradition that fascism espoused in its more extreme forms of German National Socialism and Italian fascism. While they did tolerate fascist movements, at times reluctantly to gain favor with the Axis Powers, they also quelled these movements when they posed a danger to the domestic political stability.

—Abraham O. Mendoza

and Italy (i.e., anti-Semitism, nationalism, revision of international borders, and organized shirt formations), was a significant party in the political life of the state. By 1939 the military dictatorship of Admiral Miklos Horthy ended the Arrow Cross's potential rise to power. Similarly, the fascist movement of Corneliu Codreanu, the Romanian Iron Cross, was cut off from access to power by the military dictatorship of General Ion Antonescu. In Poland, the fascist Falanga and the Camp of National Unity (OZN) were also stamped out by the military dictatorship of Joseph Pilsudski. Lastly, the Croatian Ustasha movement under Ante Pavelić in 1929 called for the creation of an independent, authoritarian Croatia free from Yugoslavia. Although repressed by the Yugoslavian government, this fascist group gained control over Croatia after the German invasion in 1941. The Ustasha was eventually dissolved by Marshall Tito at war's end when he re-created the Yugoslavian state under communism.

Fascism in Portugal

In the early twentieth century, Portugal had fallen from the heights it had achieved in the sixteenth century. The empire was now impoverished, having declared bankruptcy in both 1892 and 1902. This fall in prestige and wealth contributed to the collapse of the monarchy in 1910 and the subsequent establishment of Portugal's First Republic. Unfortunately, the republic proved to be no more efficient a government than the last kings had been. After the outbreak of World War I, the British government began urging Portugal to enter the war on the side of the Allies. The republican government decided to comply with the request in the hope that it would rally national support against the Ger-

mans and around the government. In the end, however, the war only caused further financial stress on the new government and allowed the entrance of two military dictators in 1915 and 1917.

As public resentment grew, new political and economic ideas began circulating among the educated and the elite. As a result fascism grew in popularity, primarily in reaction to the chaos that reigned and to the "atheism" of the government. Beginning in 1914, groups such as *Intehralismo Lusitano* (Lusitanian Integralism) and groups with strong Catholic origins began to gain support. The Integralists supported a strong single-party government, preferably a monarchy. The group offered to support the exiled ex-king Manuel II, but since he supported a constitutional government, he declined the offer. The Integralists then threw their support behind Duarte Nuno, the grandson of Miguel I. On May 28, 1926, a military rebellion overthrew the Republic and instituted the *Ditadura Nacional* (National Dictatorship). Several temporary rulers were appointed by the military, and in 1928 the constitution was changed in order to allow for elections. General Antonio Carmona, the only candidate on the ballot, was elected the first president of the Second Republic in April 1928. Included in President Carmona's cabinet was Antonio de Oliveira Salazar, an economics professor who had been appointed as finance minister. Salazar's economic knowledge became immediately apparent, as the 1928–1929 budget produced the first surplus in 15 years.

Salazar was viewed as the "savior of the country" and soon began addressing the populace on issues unrelated to finances. His popularity grew not only within the general population but also within specific groups that supported his views. He had the support of the Catholic Church, who looked to move away from the atheism of the First Republic; the capitalists, who wanted to conduct business without restrictions or strikes; the army; the intellectuals, which included groups like the Integralists; and the monarchists, who hoped that as a fellow monarchist Salazar would be able to bring about a return of the monarchy. On June 25, 1932, Prime Minister Domingos Oliveira resigned from the government, and Salazar took over the post. Salazar's term as prime minister is the begin-

ning of what he would call the Estado Novo (New State). A new constitution was drafted and ratified by popular vote on March 19, 1933. The voting results showed that 6,190 people voted “no,” 800,000 voted “yes,” and 500,000 abstained. The government took the abstentions as approvals and declared a victory. Salazar placed himself at the head of the União Nacional (National Union) Party, the only party now allowed, and the death of Manuel II dashed the hopes of the monarchists. Fascism was firmly entrenched in Portugal.

This New State continued on a right-wing course. All labor unions, secret societies, and political parties other than the National Union were disbanded. Salazar’s platform was one of stability, financial responsibility, and Catholicism. His commitment to the Catholic Church meant that he wanted to create a Catholic Social Order, and he based all secular laws on the Bible and the doctrine of the Church. However, the Catholic faith was never forced on anyone, and even though it was taught in public schools, non-Catholic parents had the option to remove their children from religious instruction. In addition, like the other fascist regimes, Salazar strongly opposed communism and persecuted communists as well as anyone else who opposed his power. Education was not a priority for the government, but the curriculum was centered on Portugal’s glorious past, particularly in 1940, which marked the 300th anniversary of Portugal’s independence from a 60-year period of Spanish rule. In addition, Salazar also had a secret police force, which after 1945 would be officially known as the *Policia Internacional e de Defesa do Estado* (PIDE, International Police for the Defense of the State). Up until 1945 the secret police modeled itself after Adolf Hitler’s Gestapo, arresting suspected political prisoners and using methods of torture at their prison in Cape Verde.

Despite Salazar’s admiration of Benito Mussolini, when war started in Europe, Salazar found that he did not have much use for Hitler and his ideals. Not only was the Führer becoming a real threat, but Portugal was still allied with England, a 550-year alliance that was the oldest in Europe. After the disaster of World War I, Salazar decided that it was best to stay neutral during World War II, although he did allow the allies to construct a base on the island of Ter-

➤ LUSOTROPICALISM

One of the goals of the Salazar regime was to revive the glorious history of Portugal to both the Portuguese and the rest of the world. One aspect of this glory would come partially from a theory conceived by Gilberto Freyre in the 1930s called lusotropicalism: the idea that the Portuguese had been the most humane and color-blind of the colonial empires, especially vis-à-vis the Spanish. Salazar upheld lusotropicalism as a reason why Portugal needed to maintain its colonial empire, despite the widespread decolonization that was occurring throughout the world and the growing skepticism of the Portuguese that keeping the overseas empire was necessary. Freyre maintained that the Portuguese were the most natural colonizers, especially in Africa, because as a maritime society many different people had passed through its borders over the centuries. In addition, the Portuguese policy of miscegenation proved that they were more color-blind and tolerant than other nationalities. Finally, Salazar used these concepts to prove that without its overseas empire, Portugal could not maintain its independence or its glory. In reality, the Portuguese reacted the way they did to the indigenous populations they encountered because the goal of the Portuguese was to establish trade rather than conquer. Since the Portuguese population was small, they did not have the necessary number of people to populate their colonies. Therefore, they intermarried with the indigenous populations out of necessity as opposed to being motivated by an inclusive tolerance unique to Portuguese culture and history. This idea of lusotropicalism is the opposite of the Black Legend: the idea that the Spanish were cruel to indigenous Americans because of their history and nationality.

—Monique Vallance

ceira, in the Azores. Portugal was also a favorite place for many exiles from both the Spanish Civil War and World War II.

Salazar remained in office until he suffered a brain hemorrhage in 1968. The Estado Novo fell relatively quickly after that, lasting only another six years and falling with the Carnation Revolution in 1974, when democracy was restored to Portugal.

Fascism in Spain

Through the late nineteenth and early twentieth centuries, the political situation in Spain was extremely complex and fluctuating. The nation was highly fragmented into regional interests (especially Catalan and Basque), nationalists, republican liberals, monarchists (Carlists), socialists, communists, and anarchists (most popular

among the rural workers). From the Revolution of 1868, Spain was racked by a succession of liberal advances and conservative reactions, which often undid liberal legislation, reinstated the monarchy, and protected the Catholic Church. In 1898 Spain endured the loss of most of its remaining empire to the United States in what Spaniards termed simply “the Disaster.” In the early twentieth century Spain continued to suffer through political near-chaos and a lingering sense of national humiliation.

By 1918 the labor agitation of Spanish anarcho-syndicalists gained tremendous momentum beyond the control of its organizational leadership. Strikes (including the highly successful Barcelona Strike of 1919) and violence between workers and employers racked the country. In an effort to bring stability, General Miguel Primo de Rivera staged a military coup, or pronunciamiento, in 1923 with the support of King Alfonso XIII. Primo de Rivera believed that it was his mission to provide a temporary military government that would clean out corruption and subversion and then hand over the government to legitimate politicians.

Primo de Rivera is not considered a genuine fascist even though he openly admired Mussolini and often consulted him on matters of policy. Primo de Rivera’s rule became increasingly contentious, as he alienated the Left as well as the Catalan regionalists. By 1930 in spite of some important successes, the political situation in Spain had returned to one of constant uprisings and demonstrations. The king dismissed Primo de Rivera, but his earlier support of the dictator guaranteed his own unpopularity with the people. On August 17, 1930, an alliance of various liberal and moderate groups agreed to overthrow the monarchy. King Alfonso left Spain rather than face a civil war and further violence. A new government, the Second Republic, was established, although its leadership fluctuated from those who represented the socialists to those who represented the more conservative interests.

In response to the Second Republic, Jose Antonio Primo de Rivera, son of Miguel Primo de Rivera, founded the Falange Española (Spanish Phalanx) in 1933. He was driven by an ambition to vindicate the work of his father, who had died

Falange Española was a Spanish political party, founded in 1933 by José Antonio Primo de Rivera. Professing generally the principles of fascism, the Falange distinguished itself from other fascist groups by its great emphasis on national tradition. (Library of Congress)

in disgrace, and to unite Spain along the lines of a strong fascist state. His party promoted the reorganization of the economy into a “Corporate State,” the preservation of the rights and privileges of the Roman Catholic Church, the celebration of Spain’s imperial past, and the adherence to a fierce anti-Marxist stance.

Though very small at first, the Falange grew and eventually led street squads in violent confrontations with demonstrating workers. The squads of the Falange were uniformed in the fashion of fascists all over Europe, wearing blue shirts and a red military beret. In the 1936 elections the Popular Front (an alliance of Leftist organizations) produced a victory for the socialists, who immediately suppressed the fascist agitators, including the arrest of Primo de Rivera. This prompted the Falange party leadership to join the military conspiracy of General Francisco Franco, who was preparing a new pronunciamiento to overthrow the Leftist government. On July 17, 1936, the African Army (stationed in Morocco) rebelled and eventually joined the right-wing forces, including Falange troops, in Spain. The Spanish Civil War had begun.

The Spanish Civil War holds an important place in the history of fascism. It involved a struggle between the legitimately elected Spanish Republican Government and the Nationalist military led by Franco. Franco was able to procure direct material and military support from Fascist Italy and Nazi Germany, both crucial to his securing supreme command. The liberal-democratic powers, most importantly France and Britain, remained neutral, which forced the Republican Government to accept military aid from the Soviet Union. Thus the Spanish Civil War was seen by many as representative of the coming struggle for power between the extremes of fascism and communism.

The Nationalist forces eventually defeated the Republic, primarily due to better equipment, better-trained troops, and aid from the fascist powers. Also of consequence was the fact that while the Republican command was becoming fragmented, the Nationalists were being strengthened by troops and equipment from Italy and Germany. In fact, the most notorious example of fascist military ruthlessness was the bombing of

➤ SPAIN AND WORLD WAR II

Spanish allegiances were constantly shifting during World War II. Ideologically, Spain sympathized with its former fascist allies and benefactors, Germany and Italy. Adding to the Axis allure was the possibility of extending Spanish control into French North Africa. However, having just ended a violent civil war, Spain was in no condition to stand up to the military might of Britain and the Allies. While Spanish leader Francisco Franco maintained official neutrality only until 1940 after the fall of France, Spain remained a nonbelligerent entity throughout the war. Despite this nonbelligerent stance, Spain produced a bombardment of pro-Axis propaganda; focused trade away from the Allies and toward the Axis Powers; allowed Nazi agents onto Spanish soil; provided Germany with war-related raw materials, especially wolfram; secretly allowed Axis ships to use Spanish ports; and even organized a force of 47,000 purported volunteers, known as the Division Azul, to fight against the Soviets on the eastern front. However, as the tides of war shifted in favor of the Allies and as the United States and Britain starved Spain into submission with embargos, Spain renewed its position of official neutrality and toned down the open support of the Axis Powers. To the dismay of the tens of thousands of Spanish Republican volunteers and Spanish Civil War veterans who came out of exile and hiding to once again fight against authoritarianism, the Allies did not liberate Spain and oust Franco at the conclusion of World War II. Franco remained in power until 1975, in large part due to his noncommittal policies.

the Basque town of Guernica in 1937, where German bombers experimented with the blitzkrieg tactics that they would eventually put to use in World War II. Franco’s troops eventually marched into Madrid on March 28, 1939.

Previously Franco had begun to incorporate the Falange into his own right-wing coalition, and by the spring of 1937 the alliance coalesced

into the Falange Española Tradicionalista y de las Juntas de Ofensiva Nacional-Sindicalista. The party retained the Falange's agenda but was controlled tightly by General Franco. After the war Franco used the party as the vehicle for his rule and, like most other fascist dictators, began the process of brutally eliminating his opposition. Within a decade, Franco had executed nearly 250,000 perceived political enemies.

During World War II Franco had significant conferences with Hitler and Mussolini and offered them aid in the way of grain, natural resources, and the use of Spanish islands as submarine bases. At the same time, however, Franco maintained that Spain was in no condition to enter the war and remained neutral for its entirety.

With the help of Falangist policy advisers, Franco implemented many fascist-style policies, such as the establishment of a corporative economy, the utilization of the Catholic Church as a pillar of the state, and the pursuit of economic self-sufficiency. It was the development of the Cold War that helped Franco further consolidate his power and to emerge from the shadow of the fascist discredit from World War II.

In 1953 Franco and Dwight D. Eisenhower reached an agreement that allowed the United States to establish extensive military bases on Spanish soil. This agreement, which added revenue, renewed Spain's public image, gained the protection of the United States, and contributed to Spain's economic miracle of the 1950s and early 1960s. From that point on, Franco gradually reduced the fascist characteristics of his government, pursuing more liberal economic policies and appointing more technocratic officials. Spain remained a military dictatorship until Franco's death in 1975. Upon the dictator's death, the Spanish monarchy was restored, and King Juan Carlos I began the nation's move toward democratization.

Fascism in Latin America

Understanding the history of fascist movements in Latin America involves tracing the influences of European fascist regimes in the Western Hemisphere and resolving questions over the definition of fascism as a European or a universal phenomenon. European regimes such as Francisco Franco's Spain and Antonio Salazar's Portugal actively promoted fascism in Latin America. However, scholars disagree on whether authoritarian governments and movements in countries such as Brazil, Chile, Argentina, and Mexico can be considered fascist.

Although there are many different definitions of fascism, four main components emerge from the various interpretations. First, fascism generally describes nationalist movements that surfaced during the first half of the twentieth century as a reaction to economic and social crises brought on by modern industrialization. In Latin America these crises were generally related to increasing levels of urbanization and labor unrest. Second, movements characterized as fascist were frequently self-identified as a third path of development, distinct from capitalism and socialism. In Latin America such triangulation also often included a strong anti-imperialist position. By and large, an authoritarian and charismatic leader personified fascist movements, and in Latin America this element drew on the long-standing tradition of the authoritarian caudillo (military strongman). Finally, scholars tend to limit the label "fascist" to movements that spread from the initial developments in Benito Mussolini's Italy and Adolf Hitler's Germany, and they subsequently explore the direct links between the European examples and their Latin American variants.

The worldwide diffusion of fascist ideology formed a critical component of fascist governments. As a general rule, the authoritarian regimes in Europe with ethnic and cultural ties to Latin America actively cultivated influential contacts with the region. Fascist Italy's relationship with the immigrant organization Lega Fascista del Nord America (Fascist League of America) served as a model for this behavior. The Spanish regime of Francisco Franco actively pursued the foreign policy of hispanidad, which was a com-

prehensive program of activities in Latin America. Franco's program was designed to garner recognition and legitimacy for his regime both at home and abroad as well as to increase the international prestige and influence of Spain in the Americas. Similarly, Salazar's Estado Novo (New State) in Portugal cultivated closer ties with recent Portuguese immigrants in Brazil, as Salazar envisioned the Portuguese immigrant as an agent of his Estado Novo.

The fact that Brazil was home to the most self-consciously fascist movement in Latin America also merited Salazar's close attention. The circulation of several Far-Right political journals and fascist literature concerned with Brazil's national problem aided the development of several right-wing regional movements motivated by the European fascist ideology. Most of these factions coalesced, in the early 1930s, into the Integralismo (Integralism) movement, founded and led by Plínio Salgado. Integralism advocated a corporatist state whose purpose, among other things, was to arbitrate conflicts between capital and labor. In addition, Salgado also adapted many of the symbols of European fascism by creating a green-shirted paramilitary organization with uniformed ranks and conducting highly regimented street demonstrations. Although Getúlio Vargas incorporated many of the authoritarian and corporatist policies of Integralismo into his own vision of an Estado Novo for Brazil in 1938, the Ação Integralista Brasileira (Brazilian Integralist Action) party never completely merged with the state as it did in fascist Italy and Nazi Germany. Instead, Salgado twice failed in attempts to overthrow Vargas's increasingly dictatorial regime and replace it with his vision of an Integralist state with Salgado at the helm. In 1939 Vargas had Salgado arrested, imprisoned, and later sent into exile in Portugal.

The unsuccessful coup by the Movimiento Nacional Socialista de Chile (National Socialist Movement of Chile) in September 1938 also exemplifies the failure of fascism to take root in Latin America with the same effectiveness that right-wing movements attained in Europe. Chilean Nacismo (Nazism) held that the nation and society were coterminous and that the nation acted as a natural entity within which socio-

➤ PLÍNIO SALGADO (1895–1975)

Plínio Salgado, best known as the leader of Brazilian Integralism, began his political career in 1918 with his involvement in the founding of the Partido Municipalista in rural Brazil and ended as a member of Brazil's House of Representatives from 1958 to 1974.

Salgado's time as leader of the movement that most closely resembled European fascism lasted from the foundation of Ação Integralista Brasileira (Brazilian Integralist Action, AIP) in 1933 until his forced exile in 1939. He famously wore a square moustache reminiscent of Adolf Hitler, and his followers dressed in green-shirted uniforms for public demonstrations that contained antiliberal, anticommunist, and anti-Semitic rhetoric. One of the most important principles of Integralism was the Revolution of the Self in which Salgado encouraged citizens to stop thinking selfishly and instead begin to integrate themselves into the nation, or the homeland. Although Brazilian president Getúlio Vargas relied upon Integralist support during his rise to power, Vargas quickly turned on the AIP in response to Salgado's attempted coups and as a strategy to centralize Vargas's political authority.

The end of Brazil's Estado Novo in 1945 cleared the way for Salgado's return from Portugal. The former Integralist leader helped found the Partido de Representação Popular (Popular Representation Party) and ran unsuccessfully as its presidential candidate in 1955. Beginning in 1958 Salgado served for 16 years in the Brazilian Congress. He retired from active political life in 1974 and died in his native state of São Paulo in 1975.

—Jonathan Hagood

economic problems should be discussed and solved. The head of the Nacista movement, Jorge González von Marees, known as El Jefe (The Chief or The Boss), acted with absolute authority. He implemented a vertical political command structure that demanded total obedience and rejected the principles of deliberation and agreement.

Three factors help explain why fascist movements did not have the same political success in Latin America as they enjoyed in Europe. First, adherents to fascist philosophy imported

from Europe were always numerically small in relation to their size in Europe, with the exception of the supporters of Brazilian Integralism. Second, charismatic and authoritarian leaders primarily drew upon Latin American traditions of caudillismo rather than fascist visions of the state, and these strongmen sometimes appropriated aspects of fascism without embracing it completely (e.g., Vargas in Brazil). Finally, nationalist movements in Latin America frequently contained a strong pro-Catholic component, a hierarchical and religious element often lacking in European variants of fascist movements. All of these factors suggest that left unchanged, Euro-

pean fascism faced strong competition from pre-existing authoritarian and corporate tendencies in Latin American politics and society.

■ Introduction: Revolution and Rebellion

From 1900 to 1945, myriad revolutions and rebellions occurred in various world regions as the political structures of European hegemony became unraveled by two world wars and a global economic collapse. In Europe itself, the Russian Revolution of 1917 overthrew a centuries-old autocratic system and replaced it with a socialist state, setting a precedent for what was possible if the masses were willing to rise against a system of oppression. As nationalist sentiment awakened, European colonialism from its direct forms in Africa and Asia to its indirect manifestations in Latin America triggered various uprisings ranging in size and consequence.

The Arab Revolt (1916)

The Arab Revolt of 1916 was one of the first successes for Arab nationalism and helped define the modern boundaries of Jordan, Iraq, Israel, Lebanon, and Syria. In 1915 Sharif Hussein ibn Ali, the emir of Mecca and protector of the Holy Places of Islam, believed that his position was threatened by Wahib Pasha, the Ottoman official in Mecca. As a consequence, Hussein initiated a dialogue with the underground Arab nationalist movements, the British government, and the Ot-

toman government. In essence, Hussein desired a unified Muslim state with Great Britain as a major trading partner.

In the Hijaz, the west coast of the Arabian Peninsula that contains both Mecca and Medina, Hussein discovered a plot to overthrow his authority and began to search for an ally against the Ottomans. He sent his son Feisal to Istanbul to enter a complaint against Wahib Pasha. While in Istanbul, Feisal not only met with Ottoman government officials but also conducted secret meetings with the underground Arab movements against the Ottomans, called al-Fatat and al-Ahd. In these secret meetings the Damascus Protocol was adopted as a basis for all further negotiations with the British government. This protocol included not only the desired boundaries for a future Muslim state but also the preference for Great Britain as a trading partner with this future state. In June 1915 Feisal returned to Mecca with the Damascus Protocol, whereby Hussein began negotiations with the British.

The political weakness of the Ottoman Empire had also become a concern of the British government by 1914. The British were worried that if the German-Ottoman alliance won World War I, British interests in the Middle East would be severely damaged. As a consequence, Lord Herbert Kitchener, the British secretary of state for war,

commanded Sir Henry McMahon, the British high commissioner in Cairo, to negotiate a treaty with Hussein. A series of correspondences among Hussein, McMahon, and the British government began in mid-July 1915 concerning a list of requests similar to the Damascus Protocol. McMahon did not initially accept Hussein's boundary demands and devoted subsequent letters to negotiating these terms. The issue of boundaries was a sensitive one for the British due to their alliance with France and ultimately was left undefined.

Prior to beginning the 1916 Arab Revolt, Hussein tried to amend relations with the Ottoman Empire, making the same requests that were included in the Damascus Protocol. When the Ottoman government refused, Hussein and his sons Ali and Feisal participated in the first part of the revolt and took Mecca. Hussein then issued a statement claiming that he was saving Islam from the current secular Ottoman government. The Ottoman officials were stunned but were too preoccupied with executing members of the underground Arab groups in Damascus to mount an effective response.

In Damascus, Feisal believed that more than 10,000 Arab men would revolt at their call. Despite the success in Mecca, the revolt did not spread to the Arabs in the empire. Hussein then sent Feisal to accompany T. E. Lawrence in an attempt to capture Damascus. To do this they needed to secure the railroad lines, which led them into Transjordan and Palestine. When this proved difficult, they began attacking the port of Aqaba on the Red Sea. British troops from Australia and New Zealand (ANZAC) were commanded to surround Damascus and wait for Feisal in order to stage a triumphant entrance into the city, delivering it back into Arab hands. This was thwarted when the ANZAC troops entered and occupied the city to discourage a local takeover. Feisal did enter the city in 1918, and Lawrence and the new British war minister, David Lloyd George, spread propaganda that Feisal had liberated the city from Ottoman control.

The British government, due to other agreements, reneged on its promise to give Hussein direct control of the Arab lands, taking Palestine, Iraq, and Transjordan for itself. They did, however, give Hussein's family control of Transjordan and Iraq. Feisal ruled in Iraq until 1958, when

➤ WINSTON'S HICCUP

At the Cairo Conference of 1921, British colonial secretary Winston Churchill boasted of having created Transjordan "with a stroke of the pen one Sunday afternoon." The British bestowed the new state upon Abdullah, the son of Faisal, for his family's role in the Arab Revolt during World War I. According to legend, while drawing Transjordan's eastern border with Saudi Arabia, Churchill, a lover of both food and drink, hiccupped, causing his pen to swerve off course. The resulting large indentation into the interior of Transjordan is to this day known as "Winston's Hiccup." While there is likely little truth behind the anecdote, it does highlight the arbitrary nature in which the borders of the Middle East were drawn after the fall of the Ottoman empire.

The Ashanti Rebellion (1900–1901)

The 1900 Ashanti Rebellion was the culminating war between the British and the Ashanti over land and control of Ghana's coastal region. This rebellion, which was led by Yaa Asantewa, the queen mother of Edweso, had a long and

THE GOLDEN STOOL

As Ghana's symbol of nationhood, the Golden Stool looms large in the country's lore and culture as it tells the story of the Ashanti (Asante) kingdom's birth. Legend states that a golden stool floated down from the heavens and landed onto the lap of the first Asante king, Osei Tutu. Priest Okomfo Anokye, who served as an adviser to the first Asantehene (Asante ruler), declared that the Golden Stool represented the new Ashanti kingdom. The stool garners enormous respect. No one—not even the king—sits on the stool. Hidden in a secret place and heavily guarded, the Golden Stool, which contains the spirit or the soul of the Ashanti people, is only taken outside during special occasions. Because the stool can never touch the earth, it lies on a piece of leopard skin or other animal hide. Its features, which consist of four sculpted pillars and a central column, compliment a curved seat inlaid with gold. Bells dangle from the Golden Stool to alert the king of impending danger. The Ashanti jealously guard the stool and have historically defended its stature and honor. In 1896 for example, the Ashanti allowed their king, Prempeh I (r. 1888–1931) to experience exile rather than lose the war or the sacred stool. The Ashanti also protested against Sir Frederick Hodgson's demand to sit on the stool in 1900. Rather than submit to his forceful request, the Ashanti prepared for war. To commemorate the Golden Stool's spiritual and historical importance, participants, who carry the chief's stools from the old slave castle of Elmina, commemorate this sacred artifact in a traditional yearly ceremony. The Golden Stool is a treasured monument that unifies disparate Ghanaian communities while further solidifying the idea of nationhood in this West African nation.

sustained history whose roots can be traced back to the early nineteenth century. At that time, most of the Gold Coast's fortresses were under British control. British territorial reign included the area where the Ashanti (who form part of the Twi-speaking people of the Akan in present-day Ghana) lived and enjoyed relatively peaceful relations with the Dutch in the central part of the country, some 186 miles (300 kilometers) from the coast.

The Ashanti Confederacy, which was a major state from 1570 to 1900, was ruled under paramount chiefs called Asanthenes. These chiefs supervised an area abundantly rich in gold deposits. Besides the trade in gold, the Ashanti participated in slave trafficking. The Ashanti captured human chattel, whom they obtained from neighboring nations either through raids or through bartering and then sold to European slave traders. Because the Ashanti focused principally on the selling of slaves, they neglected other enterprises such as agricultural production and cloth manufacturing. Then, with the banning of slave trading in the 1850s, which the Ashanti did independently of the British and other European powers, the Ashanti further weakened their economy because they no longer had their main revenue generator, slaves, to sustain their state's economic growth. The Ashanti's prominence and stature in the region similarly declined. The Ashanti's weakened state captured the attention of their former European allies, the British, who viewed the Ashanti's vulnerability as an opportunity to further their own geopolitical aims. These aims included controlling the land that the Ashanti inhabited and creating a European colony over the entire coastal region.

The Ashanti were one of the few African nations that offered the British serious and recalcitrant resistance. British presence presented a geopolitical problem for the Ashanti, who viewed the intrusion of colonial forces as an infringement upon their sovereign rights and therefore wanted to expel the British from their territory. In 1826 the Ashanti Army launched an offensive attack against the British along the coast. During this encounter the Ashanti suffered major casualties and had to retreat from the coastal plains near Accra because the superior firepower of the British and the Danish had militarily overwhelmed them. With the Ashanti defeated and the Europeans having a tactical advantage, the two warring factions signed a peace treaty in 1831. That treaty did not end the Ashanti's woes.

The British were relentless in their pursuit of pacifying the entire central area as they signed a political agreement, referred to as the Bond of 1844, with a confederation of Fante states. That agreement not only extended protection to the signatory states but also allowed the British to

have authority over them. With Britain purchasing all the territory once owned by Denmark and the Netherlands, it became the sole European country exercising influence over the indigenous people. The Ashanti, who felt further threatened by Britain's systematic consolidation of power and territorial ownership, launched an invasion in 1873. The British responded by dispatching an expeditionary force to the Ashanti territory, where they captured the capital, Kumasi, and then razed the villages and administrative center. Fearing further retribution, the Ashanti retreated.

That short-lived invasion led to the Ashanti signing yet another treaty with the British. The treaty's stipulations were as follows. The Ashanti agreed to recognize British sovereignty over the entire coastal region, to pay war-reparation costs, and to renounce authority over all territories that resided under British protection. In return, the Ashanti received Britain's pledge about the coastal area. Following this treaty, the British immediately proclaimed the coastal territories as the Gold Coast Colony and then moved their administrative headquarters from the Cape Coast to Accra.

In the subsequent years, tension between the Ashanti and the British mounted. The Ashanti soon lost their autonomy when the British attacked and occupied their territory and then proclaimed it a protectorate. British officials captured several Ashanti elders, including King Premph, and imprisoned and exiled them to the Seychelles, a small island nation situated in the Indian Ocean. The British were not satisfied with this military gain; they wanted to possess the Golden Stool, the supreme symbol of Ashanti prominence and nationhood, and demanded its surrender on March 28, 1900. British officials dispatched Captain C. H. Armitage to find the Golden Stool, bring it back, and place the symbolic artifact under British custody. Visits to several villages produced no results, and when Armitage found the homesteads populated only by children, as the parents were hiding, he bound and beat them. Armitage meted out the same reprisal to the parents when they surfaced from their hideaways. All of these occurrences instigated the 1900 Ashanti rebellion known as the Yaa Asantewaa War for Independence.

Under the leadership of Yaa Asantewaa, who served as the military tactician and spiritual guide, the Ashanti held a meeting to galvanize the army and prepare for war. Yaa Asantewaa motivated the army with these inspiring and provocative words: "Is it true that the bravery of the Ashanti is no more? If you men of Ashanti will not go forward, then we will. We the women will. I shall call upon my fellow women. We will fight the white men. We will fight till the last of us falls in the battle fields."

With this call to arms, the Ashanti, who used musketeers, bowmen, and spearmen, laid siege to the British mission at the fort of Kumasi, where the British governor and his entourage took refuge. The Ashanti occupied the fort for three months. The British responded by sending 1,400 troops and additional artillery to quell the rebellion. When the revolt ended in 1901, the British captured and exiled Yaa Asantewaa and 15 of her closest advisers. The last Ashanti rebellion resulted in the formal annexation of the Ashanti empire as a British possession on January 1, 1902.

The Chinese Revolution (1911-1912)

Named for the year when it began, the Chinese Revolution of 1911-1912, or the Xinhai Revolution, fatally weakened China's Manchu (Qing) dynasty (1644-1912). An unexpected revolt began in Wuchang (in Wuhan City). Thereafter, a clever military leader of the empire self-servingly allowed the revolt to spiral out of control. While China's expanse was simply too large for any imperialist country to colonize, foreign powers had diminished Chinese sovereignty with treaty ports, "unequal treaties," and judicial extraterritoriality. Concerned

CHRONOLOGY OF THE CHINESE REVOLUTION

1911–1912 Chinese Revolution

November 24, 1894	Sun Yatsen founds “Revive China Society” in Hawaii.
February–June 1909	Elections for provincial assemblies and local councils.
October 10, 1911	Wuchang Uprising.
December 25, 1911	Sun Yatsen returns from foreign fund-raising trip.
January 1, 1912	Sun Yatsen proclaims Republic of China in Nanjing.
February 12, 1912	Pu Yi abdicates Qing throne.
February 12, 1912	Sun Yatsen resigns presidency.
February 15, 1912	Yuan Shikai elected provisional president.
1915–1927	New Culture Movement.
June 6, 1916	Yuan Shikai dies.

—Vincent Kelly Pollard

nationalists were also irritated by the inability of their government to resist the foreigners’ incursions. China had become a semicolony. Sixty years earlier, the Taiping Rebellion (1850–1864) came close to toppling the Qing dynasty. At the end of four months of sharpened political turmoil during late 1911 and early 1912, the Qing rulers formally ceded power.

Sun Yatsen (1866–1925), also known by his formal name Sun Wen or Sun Yatsen, was the most important political and intellectual leader of the 1911–1912 Revolution. Sun dedicated his life to overthrowing the foreign Manchu rulers of the Qing dynasty for their inability to solve China’s poverty and its failure to defend China against foreigners. Sun energetically brought his revolutionary message of modernization and representative government to the Chinese diaspora in Japan, Southeast Asia, North America, and Europe. To this end, Sun Yatsen founded secret societies such as the Revive China Society, the United League, and the Revolutionary League. Even though Sun was periodically forced into exile, he was not deterred by the failure of ten armed revolts during the period from 1895 to 1909, and from 1905 onward he promoted repub-

licanism or representative government. Two years later Qing generals signaled their willingness to join the revolution if it looked likely to succeed. Liberal and revolutionary European ideas had opened the eyes of Chinese modernizers like Sun to radical change. However, Sun was aware of the misery of millions in the bourgeois societies. This spurred him to articulate a better future for China in his Three Principles of the People, namely, “national economy, national independence, and popular freedom.”

In response to growing demands for reform, the government made concessions. In 1909 provincial assemblies with limited debating powers were permitted to convene, and in October 1910 a partly appointive national Provisional Parliament met. These new legislative bodies generated additional political unrest, and the belated reforms were insufficient to maintain support from scholars and rural gentry. On August 24, 1911, students in Sichuan Province demonstrated against Qing economic policies. This sparked widespread fighting with local troops. Elsewhere, soldiers in Wuchang (now in Wuhan City, Hubei Province) were influenced by revolutionary ideas. After an uprising was planned in 1910, police discovered a list of names of revolutionaries in the army. To avoid further disruptions by police, revolutionaries in Wuchang’s local garrison revolted on October 10, 1911 (an anniversary that is celebrated today as “Double Tenth”), upon which the Manchu governor-general (viceroy) fled the city. Despite his request shortly thereafter, the Consular Body in nearby Hankow passed a resolution of neutrality in the belief that the revolt was not directed against foreigners (other than the Manchu) and that international treaties then in force would not be repudiated. The consuls included one Mr. Reau, a French diplomat. He was a personal friend of Sun. Their decision broke with precedents of assistance during the previous 60 years, contributing to the political isolation of the Qing dynasty.

Within a few weeks, the revolution spread to Shanghai and to 15 provinces of China. By late November 1911, defecting Qing officers held power jointly with local assembly leaders in most secessionist provinces. Armed combat was minimal. General Yuan Shikai (1859–1916) was

charged with suppressing the revolts. However, for the most part he cleverly encouraged the spread of these revolts. Negotiating with all parties to the conflict, Yuan was recognized as the military leader with the best chance of uniting secessionist forces in China.

Sun was traveling in the United States when news of the revolution caught up with him. He promoted the revolutionists' cause diplomatically. The U.S. government remained neutral, but American public opinion was favorable. Sailing to Europe, Sun succeeded in having loans to the Qing government canceled by the four-power banking Consortium (the United States, Great Britain, France, and Japan). Sun also convinced Britain to pressure Japan not to intervene in the spreading revolts. This surprising outcome was favored by two considerations. First, Britain (and France) did not want the international balance of power in China upset by Japanese or Russian intervention because inter-European rivalry from the Balkans to the Middle East was a higher priority than China. And, second, Sun convinced the British that the revolution was not directed against the European powers.

Participants' motives for supporting the revolution varied. A skilled opportunist like General Yuan Shikai seized the opportunity to increase his personal power. Influential local gentry in rural communities longed for a renewal of traditional Chinese values. As has already been alluded to, nationalists of all social classes wanted to escape the humiliation of imperialist incursions and to drive the foreigners out of China. At the same time, commercial and industrial capitalists hoped that their business enterprises would prosper free of restraints imposed by the Qing dynasty.

In late December 1911 the imperial household was still negotiating with Republican forces. Meanwhile in Nanjing, deputies from all the provinces elected Sun as provisional president of China. On January 1, 1912, he proclaimed the Republic of China in Nanjing. Qing officials continued to make concessions into late January 1912, and the child emperor Pu Yi (Hsuan Tung) became a nominal ruler until his abdication on February 12, 1912. Outmaneuvered by the militarily superior Yuan Shikai, Sun resigned the provisional presidency on the same day. Just

three days later Yuan was elected provisional president, and on March 10 he was inaugurated as president of China in Peking.

Less violent than the civil wars to follow, the 1911–1912 Revolution ended more than two millennia of imperial rule. Tactical unity among politically diverse revolutionists did not create a unified republican China; instead, divisive monarchist and warlord tendencies emerged. In an early setback to the largely Han Chinese revolution, Outer Mongolia declared independence under a Russian protectorate on December 1, 1911, and the revolution also terminated Qing advances in eastern Tibet.

Yuan Shikai's influence as mediator gained in status as a result, primarily owing to his clever handling of both sides of the revolutionist conflict. In actuality, life for the agricultural majority in China's countryside changed little, and Chinese women did not experience dramatic changes in their status. Meanwhile, imperialist countries continued to benefit from extraterritoriality and the continued extraction of China's wealth. Yet the revolution expanded the public forum for discussion and debate about the nature of good governance, and its irritating shortcomings raised expectations. As a consequence, the inadequacies of the Xinhai Revolution spurred the Chinese masses and intellectuals to struggle for a more radical social transformation.

The German Revolution (1918–1919)

The German Revolution refers to the events that destroyed the Hohenzollern monarchy and resulted in the founding of the Weimar Republic. The upheaval began in late September 1918 when Germany's High Command concluded that the war was lost and urged the kaiser to conclude an armistice with the Entente Powers. The military, along with top imperial officials, also called for the appointment of a new government based on a majority in the Reichstag. Such a government, they believed, would be able to negotiate more favorable terms with the Allies while also allowing the generals to fob off their own responsibility for the defeat onto the civilian politicians. In October this revolution from above resulted in an exchange of diplomatic notes and a series of legislative changes that transformed Germany's semiautocracy into a constitutional monarchy in which the new chancellor, Prince Max von Baden (1867–1929), was responsible to parliament rather than the kaiser. The strategy was cut short, however, when popular unrest exploded into a revolution from below that swept away the monarchy in early November.

This explosion had its roots in the widespread discontent that intensified as wartime conditions worsened. By 1918 many Germans, especially workers, had been worn down by severe shortages of food, fuel, and other basic goods; declining working conditions; and losses on the war front. While many still hoped for victory, antiwar sentiment grew, and in January massive strikes across Germany demanded peace. When it became clear that defeat was imminent, many Germans came to see the monarch as an obstacle to achieving favorable peace terms. To them, the reforms undertaken by von Baden's government did not go far enough.

On October 28 a naval mutiny at the Kiel naval base precipitated the onset of a nationwide rebellion. On that day, sailors refused to follow the admiralty's orders to put to sea for one last battle against the British fleet. Within days, local workers joined the sailors in their act of defiance and organized a workers' and soldiers' council that took control of the city. Similar actions soon

occurred around the country as armed workers and soldiers established councils that displaced the rapidly dissolving authority of the imperial police and military. By November 9, 1918, the revolution had reached Berlin. In the face of massive public demonstrations, Prince Max announced Kaiser Wilhelm II's abdication and transferred power to Friedrich Ebert (1871–1925), head of the Sozialdemokratische Partei Deutschlands (SPD, Social Democratic Party).

The SPD was the largest German political party and the nation's most important proponent of democratic reform. As a Socialist Party, it was not surprising that many members welcomed the kaiser's overthrow, but the SPD had long been a force for political reform, not revolution. In 1914 its leaders backed the government's war effort, and in 1918 they joined Prince Max's cabinet. Now they were preoccupied with Germany's disastrous military and economic situation and were not interested in an immediate and radical break with capitalism or the monarchy. Instead, their higher priorities were to negotiate an armistice, to begin an orderly transition to a peacetime economy, and to establish a parliamentary republic as a framework for gradual social, economic, and political reforms.

To achieve these ends, Ebert proposed creating a Provisional Government with the more radical Unabhängige Sozialdemokratische Partei Deutschlands (USPD, Independent Social Democratic Party of Germany), whose members had broken with the SPD over the latter's support for the war. The USPD leaders agreed, and on November 10, 1918, the two groups formed the Rat der Volksbeauftragten (Council of People's Deputies), which won the decisive support of the workers' and soldiers' councils.

The council soon found itself divided: Only two days after the agreement, it issued decrees granting universal suffrage and the eight-hour workday, but disputes arose over the timing of elections to the national assembly that would write a new constitution. The SPD wanted elections to take place as soon as possible, while the USPD called for the socialization of industry and the democratization of the state and the army before holding elections. The Far Left element of the USPD, led by Karl Liebknecht and Rosa Lux-

emburg, had participated in the Spartakusbund (Spartacus League) during the war and were now starting to reject parliamentarianism altogether and demanding a German republic based on soviets, or local workers' councils.

The mid-December 1918 decision of the Congress of Workers' and Soldiers' Councils to hold the elections to the National Assembly on January 19, 1919, represented a victory for the SPD and deepened tensions within the coalition. These conflicts climaxed on Christmas Eve, when the USPD members quit the coalition after Chancellor Ebert, who had earlier secretly allied himself with the Army High Command, called in troops to suppress a mutiny in Berlin without consulting USPD leaders. Now ruling alone, the SPD used the army to crush the January 1917 uprising in Berlin, led by the newly founded *Kommunistische Partei Deutschlands* (Communist Party of Germany), in which troops murdered Spartacist leaders Luxemburg and Liebknecht. For the next six months, the SPD relentlessly put down workers' rebellions throughout the country, culminating in the brutal suppression of the Bavarian Soviet Republic in May 1919.

Meanwhile the January 1919 elections went forward, and the newly elected National Assembly convened in Weimar on February 6, 1919. The Social Democrats were in the plurality, although no party obtained a majority. As such, the SPD was forced to form a coalition with the liberals and Catholics, and over the next six months the National Assembly signed the Treaty of Versailles (June) and hammered out a new constitution (August).

The SPD leaders had hoped to steer the November 1918 upheaval in a direction that would lead to peace and the establishment of a democratic republic that embodied a wide range of freedoms and the promise of continued social and economic reform. A year later, the party had achieved those aims but at great cost. Not only could the recovering nationalist right now blame the new democracy for losing the war and for the humiliation of Versailles, but the SPD's hesitation to carry out more thorough reforms and its alliance with the reactionary officer corps to crush left-wing opponents deepened the rift within the workers' movement. The failure to create the new republic on the basis of stronger

➤ ROSA LUXEMBURG AND THE GERMAN REVOLUTION

Rosa Luxemburg was a Jewish German Marxist theorist and activist who supported the German Social Democratic Party (SPD). In 1914 following the SPD's support of German participation in World War I she cofounded, with Karl Liebknecht, the revolutionary Spartacist League (Spartakusbund). The Spartacist League would eventually become the German Communist Party (*Kommunistische Partei Deutschlands*), or KPD, in 1919. In November 1918 during the German Revolution, she founded *The Red Flag*, the official newspaper of the Leftist revolutionaries, to spread the news of the revolution and the ideological tenets for the foundation of a new socialist Germany. Ultimately, as the rebellion was crushed by the *Freikorps* (freelance right-wing militias), Luxemburg, Liebknecht, and hundreds of left-wing revolutionaries were slaughtered. In spite of her tragic end, Luxemburg, along with Liebknecht, became a martyr to millions of Marxists and communists in the interwar period.

—Abraham O. Mendoza

institutions and a broader social consensus ultimately weakened its ability to withstand later challenges.

The Guatemalan Revolution (1944)

For ten years, Guatemala experienced an unprecedented revolution that sought to improve the plight and suffering of Guatemalans during the

Great Depression. The 1944 Guatemalan Revolution and the “Ten Years of Spring” that sprang from that revolution can only be understood in a world-historical context. The 1944 Guatemalan Revolution is often seen as a precursor for Leftist movements, most notably the Cuban Revolution of 1959. This view is misguided, however. When Guatemalan dictator Jorge Ubico was overthrown in 1944, the two presidents who succeeded him undertook an astonishing program of reform that was quashed by foreign influences that viewed the 1944 revolution as communist.

Against the backdrop of the worldwide economic depression, Ubico assumed dictatorial control of the country in 1931. To help alleviate the economic hardships, Ubico passed two highly controversial laws. The first was Public Roadways Law that required people to work on public works projects for two weeks a year. Of course people could avoid this service by paying a fee. The second was the Vagrancy Law that required all people who owned less than a predetermined amount of land to carry cards showing that they had worked at least 150 days on one of the country’s large estates. This measure was highly unpopular because less than 7 percent of Guatemalans owned land, meaning that a vast majority of Guatemalans were forced to work under the Vagrancy Law.

Although there was some modest economic recovery, Ubico’s reforms and policies only made the rich wealthier. Life was still hard for the people in Guatemala’s countryside. One major point of contention was the presence and power of foreign companies such as the United Fruit Company (UFCO). The UFCO owned an estimated 550,000 acres (223,000 hectares) of land in Guatemala, of which only 15 percent was in use. The difficult economic times led many to protest. Ubico responded with authoritarian measures to quash any opposition. This strategy worked until 1944 when, amid growing street protests led by the middle classes and the urban sector, Ubico resigned and fled the country. The ten years that followed was an interesting period in Latin American history. The 1944 revolution ushered in a period of reform that was ultimately suppressed by the United States amid fears that it was influenced by communist principles.

During the period from 1944 to 1954—known as the “Ten Years of Spring”—Guatemala was a functioning democracy led by two presidents who tried to make significant improvements in the lives of average Guatemalans. In December 1944 Juan José Arévalo, a former philosophy professor, was elected president. The new president proclaimed himself a “spiritual socialist.” During his term of office he abolished the Vagrancy Law of his predecessor. One of the first steps in the revolutionary government was a series of political reforms that gave the right to vote to women and illiterate males over the age of 18. In addition, the Arévalo government introduced a labor code that provided for collective bargaining rights. Arévalo, who survived 25 assassination attempts, was a popular figure for many Guatemalans; however, he was hated by elites.

Arévalo honored his pledge against reelection, and his secretary of defense, Jacobo Arbenz Guzman, ran for president in 1950 on a platform of agrarian reform. In 1952 Arbenz pushed through the Agrarian Reform Law, known as Decree 900. The decree allowed for the expropriation of any parcel of land larger than 223 acres (90 hectares) that was unused. To most, the obvious target of the law was the UFCO. The land expropriations of the Arbenz administration caught the attention of the U.S. government, which supported a coup d’état to overthrow President Arbenz.

While the agrarian reforms of Arbenz could have been overlooked, two lawyers for the UFCO were in prominent positions in the U.S. government: John Foster Dulles, secretary of state, and Allen Dulles, director of the Central Intelligence Agency (CIA). These two men organized Operation PBSUCCESS to overthrow the Arbenz government, which led to a 30-year civil war.

The 1944 revolution in Guatemala was meant to transform the society of the Central American nation, but world historical pressures precluded the changes from being fully implemented. Global forces and the threat, both real and perceived, of communism in the backyard of the United States conspired to doom Guatemala’s efforts toward social democracy and agrarian reform.

Herero-Nama Uprising (1904–1907)

Historians of modern genocide now consider the German army's suppression of the Herero Uprising of 1904 and the Nama Uprising of 1905–1907 to be the first genocides of the twentieth century. Although the Germans governed the colony of South-West Africa (the country of Namibia today) in conjunction with local chieftains from 1884 to 1904 in a system of indirect rule, indigenous groups fought the Germans almost continually between 1890 and 1914 to preserve their rights and sovereignty. In their attempt to impose and consolidate direct colonial rule from 1904 to 1914 the Germans systematically dispossessed and killed the Herero, Nama, and San peoples and destroyed their independent political structures. Mass resistance to the imposition of direct German rule culminated in the Herero Uprising of 1904 and the Nama Uprising of 1905–1907.

As part of the scramble for Africa, German merchants such as Adolf Lüderitz (1834–1886) established trading posts and German territorial claims to South-West Africa. In 1883 Lüderitz paid local clans for land and mining rights. In 1884 the German Empire declared the whole region of southwestern Africa, from the Orange River to Angola, a German protectorate.

In 1888 the Namas and Hereros rejected the German claims to political suzerainty, and Dr. Heinrich Ernst Göring (1839–1913), the imperial commissioner, returned to Germany without their consent to German protection and suzerainty. Hendrik Witbooi (ca. 1825–1905) of the Namas rejected German rule outright, and the Germans considered him a great threat to the consolidation of their rule. In 1894 German

GENERAL LOTHAR VON TROTHA'S DECREE

On October 2, 1904, the army commander in German South-West Africa, General Lothar von Trotha, read out the following proclamation to his officers after a Sunday field service: “I, the great general of the German troops, send this letter to the Herero People. Hereros are no longer German subjects. They have murdered, stolen, they have cut off the ears, noses and other bodily parts of wounded soldiers, and now, because of cowardice, they will fight no more. I say to the people: anyone who delivers one of the Herero captains to my station as prisoner will receive 1000 Marks. He who brings in Samuel Maharero will receive 5000 Marks. All the Hereros must leave the land. If the people do not do this, then I will force them to do it with the great guns [i.e., cannons]. Any Herero found within the German borders with or without a gun, with or without cattle, will be shot. I shall no longer receive any women or children; I will drive them back to their people or I will shoot them. This is my decision for the Herero people.

[signed] The Great General of the Mighty German Kaiser.”

Von Trotha quote from Jon M. Bridgman, *The Revolt of the Hereros* (Berkeley: University of California Press, 1981), 127–128.

South-West Africa governor Theodor Leutwein (1849–1921) put down the last guerrilla-style insurgencies, fought with great determination by the Namas and their headman Hendrik Witbooi, and ruled indirectly through local headmen.

To encourage German migration, Leutwein concluded a treaty of dubious legality with one of the Herero headmen, Samuel Maherero (1856–1923), that ceded eastern Herero land and cattle to German settlers. The eastern Hereros resisted the cattle and land confiscations, and the War of the Boundary erupted in March 1896. The Germans were able to defeat the indigenous forces within a few weeks, and the situation for the Hereros steadily worsened. In 1897 the majority of the Hereros' cattle were killed by rinderpest, also known as cattle plague. This loss was a cultural

as well as economic blow since cattle embodied wealth and status in Hereroland, and the destruction of the cattle herds sparked an economic depression and cultural crisis for the Hereros. Many Hereros abandoned cattle raising and adopted nontraditional occupations, such as farming and wage labor. To make matters worse for the Hereros, the scarcity and rising price of cattle induced German farmers to raise their own cattle, and as a consequence they began to buy land from impoverished Hereros who needed cash to buy provisions, livestock, and seed.

Land sales left two dire consequences in their wake. First, the number of Germans in South-West Africa rose from 539 in 1891 to 4,500 in 1904. While whites owned just 10 percent of the land in 1904, the Hereros saw the increase as an encroachment on their subsistence base. After 1896 the Hereros saw their prime land and prized cattle becoming the property of white settlers. The sale of land went so far that the German government created tribal reserves for the Hereros, but the Hereros viewed these reserves as confirming the expropriation of their traditional landholdings. Second, the new German immigrants brought a stronger racist attitude with them. White farmers mistreated African workers, the incidents of white men raping black women increased, and the German courts did little to protect the person and rights of the Hereros. Any sense of mutual respect between sovereign peoples was evaporating.

In addition, white merchants charged usurious interest on loans, which infuriated Africans: one or two cows would be forcibly taken for a one-English-pound debt. Maherero, who turned on his German friends and led the Herero Uprising of 1904, stated that this daylight robbery of Africans was the final spark for rebellion.

On January 12, 1904, the Hereros under Maherero rose up in revolt and attacked German farms, train depots, and trading stations. One hundred fifty Germans died in the first attacks. When news of the revolt reached Germany, the German General Staff sent reinforcements of 14,000 German soldiers to fight the Hereros. Leutwein believed that he could end the uprising by talking with Maherero, but the imperial government in Berlin thought that negotiations would be interpreted by Africans as a sign of

weakness and would only encourage more rebellions. The Hereros had battled the Germans to a standstill by mid-1904, and the German General Staff decided to take drastic action, sending General Lothar von Trotha (1848–1920) to take command. Von Trotha had a reputation for brutality and a distaste for negotiation, and he reflected Berlin's desire for a quick success at any price.

He defeated the Hereros in the war's major battle, Waterberg, in August 1904, after which the Germans drove the Herero people into the Kalahari Desert, poisoned the waterholes there, and blocked all retreat back into South-West Africa. In his proclamation of October 1904, von Trotha announced that the German goal was the complete destruction of the Herero nation and their extinction as a people. He thought that the Herero Uprising was the beginning of a race war between Europeans and Africans, and his proclamation was designed to give legal sanction to the common German practice of executing Herero prisoners and civilians since the beginning of the uprising. Leutwein resigned in disgust as governor soon after von Trotha's proclamation and returned to Germany to muster opposition to this genocidal war. With public outrage in Germany growing, the German chancellor Bernhard von Bülow (1849–1929) instructed von Trotha in December 1904 to erect concentration camps in which to confine any surviving Hereros.

While the Namas also suffered loss of cattle and land at the hands of ruthless traders and experienced unequal treatment in German courts, at first Hendrik Witbooi supported the Germans in their fight against the Namas' traditional enemy, the Hereros, but after von Trotha's declaration of October 1904 he concluded that the Germans were bent on wiping out all Africans regardless of their ethnicity or gender. The increasing anti-Nama sentiments of German settlers and German newspaper accounts that after the war with the Hereros "all tribal structures would be destroyed, chiefdoms abolished, and all communities disarmed" finally provoked the Namas into open rebellion. About 1,500 Nama warriors fought a robust guerrilla war from October 1904 to October 1905 against 14,000 German soldiers. Hendrik Witbooi died from wounds he received during a raid he conducted in October 1905, and his demoralized warriors

surrendered at the beginning of 1906. However, it was not until March 1907 that the Nama people finally laid down their weapons. Nearly 100,000 native Namibians died in these wars and their aftermath. It is generally agreed that between 1904 and 1906 about 60,000 Hereros were killed out of a total population of about 80,000. Most died from thirst, exhaustion, and exposure in the desert or in the concentration camps. About 6,000 Namas died out of a total population of 20,000, and most died after the war due to hunger, mistreatment, and deportation. After their defeat, the Hereros' and Namas' traditional clan structures were disbanded, and all communal land was confiscated as punishment for the rebellion. The remaining Hereros and Namas were forced into migrant wage labor and worked on European farms and ranches. The Hereros and Namas were also required to carry passes and live in segregated housing. Within three years of the uprising's start, Germany had mercilessly crushed the independence of the Hereros and Namas, who lost all rights in their homeland, while prime grazing land came under German jurisdiction.

The Mexican Revolution (1910–1920)

The Mexican Revolution was one of the most critical political junctures in the history of Mexico. The revolution started in late 1910 and set in motion a devastating civil war. Segments of the elite struggled against each other for power, while the masses fought for major social and economic changes. For a decade the country was immersed in political chaos and social violence that led to the deaths of hundreds of thousands of Mexicans. In 1917 a Constitutional Congress passed a socially progressive constitution that provided tools for Mexico's national reconstruc-

tion and guided the reforms that followed in the ensuing two decades.

President Porfirio Díaz, who had dominated national politics since 1877, was the immediate and initial target of the Mexican Revolution. He based his long rule on fraudulent elections, routine violence against his opponents, and the dispensation of personal favors and benefits to his supporters. During his administration, foreign capital flowed constantly as foreigners increased their control of large sectors of the national economy. At the same time, land concentration increased at the expense of peasants' small and medium holdings. Díaz's policies produced impressive results, but they only benefited a small segment of Mexican society. Declining living standards among the rural masses and harsh working conditions in urban settings were intensified by a vicious recession in 1907. Workers' and peasants' demands met increased political repression. In 1910 Díaz, who had assumed power on a platform that emphasized no reelection, decided to run again for Mexico's presidency. His decision provided the immediate cause of the 1910 revolution.

In the spring of 1910 Francisco Madero, a wealthy landowner from the state of Coahuila, emerged as the leader of the anti-Díaz forces. After spending some time in jail, Madero issued his *Plan de San Luis de Potosí* in which he denounced Díaz's regime as fraudulent and called for democratic elections. The plan revealed Madero's primary political concerns and only barely addressed social and economic demands of the peasants and workers. Nevertheless, his call for a national insurrection to end Díaz's dictatorial regime offered new hope to millions of Mexicans. The rebel movement grew rapidly, and local insurrections spread throughout Mexico. After Pascual Orozco captured Ciudad Juárez in May 1911, Díaz reached an agreement with Madero, resigned Mexico's presidency, and sailed for Paris, where he died in 1915. The Porfiriato (the period of rule of Díaz) was over, but the revolution was only beginning.

On October 1, 1911, Madero was elected president of Mexico. His moderate attitude dealing with peasants' and workers' grievances disillusioned the most socially progressive forces of the revolution. His presidency lasted 14 months during which there were regional revolts, attempted

BATTLES OF THE MEXICAN REVOLUTION

coups, and labor strikes. In the south Emiliano Zapata pronounced his *Plan de Ayala*, which advocated land redistribution, municipal autonomy, and bargaining rights for workers. In the north, Orozco and his forces revolted against the government and proclaimed the *Pacto de la Em-pacadora*, decrying the president's betrayal of revolutionary principles. Foreign investors joined the pro-Díaz elites in their opposition to Madero. General Félix Díaz, Porfirio's nephew, conspired against Madero but was quickly arrested by the authorities. After quelling the Orozquista (followers of Orozco) rebellion in the north, General Victoriano Huerta betrayed and overthrew President Madero. Huerta assumed the presidency of Mexico in February 1913, and soon after former president Madero was murdered, thus initiating the most violent phase of the revolution.

Huerta assumed the presidency of a country in deep political turmoil. Emiliano Zapata in the south and Francisco "Pancho" Villa in the north refused to recognize Huerta's government. Opposi-

sition to the usurper coalesced around the governor of Coahuila, Venustiano Carranza, who issued his *Plan de Guadalupe* in March 1913. A mostly political document, the declaration refused to recognize Huerta and named Carranza as first chief of the Constitutionalist Army and as Mexico's provisional president. The coalition defeated Huerta in a series of battles in northern Mexico. In addition to his domestic military problems, Huerta's political position was also delicate at the international level: U.S. president Woodrow Wilson refused to recognize Huerta's government and in September 1913 stopped the supply of weapons to Mexico. The final blow took place in April 1914 when U.S. forces occupied the city of Veracruz, thus depriving the Mexican government of the port's customs revenues. It was clear that Huerta had lost his war on both the local and international fronts. In July 1914 he tendered his resignation and left the country.

Despite his success against Huerta, Carranza was unable to put an end to the civil war. With

Huerta out of the way, the conflict that followed brought to light the significant disparities that had characterized the goals of the various factions participating in the revolution. Villa and Zapata denounced Carranza's moderation and lack of commitment to the agrarian program of the revolution and launched a campaign against Carrancistas (followers of Carranza). In December 1914 Villa occupied Mexico City and was soon joined by Zapata. Carrancista general Manuel Obregón saved the situation. In several battles between April and July 1915, he defeated the Villistas (followers of Villa), who suffered tremendous casualties and retreated to the north to limit their rebel activity to a guerrilla war in the mountains. Zapata fared no better and was forced out of Mexico City and back to Morelos in August 1915. During this period, which is considered the bloodiest phase of the revolution, it is estimated that almost 200,000 soldiers died fighting on both sides.

By the beginning of 1916, Carrancista forces were in control of the war, and the military outcome of the revolution appeared evident. In November, Carranza convened a constitutional convention at Querétaro that excluded representatives from the most extreme revolutionary groups. Despite the reformist inclinations of the delegates, the final document included far-reaching anticlerical, nationalistic, and socially progressive provisions such as protection for workers and a commitment to agrarian reform. These provisions would guide the orientation of the revolution during the 1920s and 1930s. Reluctantly, Carranza accepted the new charter and was elected president of Mexico in March 1917. Even though the passage of the constitution did not put an immediate end to the violence—as the assassinations of Zapata, Carranza, Villa, and Obregón clearly demonstrate—it did provide important tools that guided Mexico's national reconstruction during the ensuing decades.

The Palestine Revolt (1936–1939)

The Palestine Revolt of 1936–1939, sometimes referred to as the Arab Revolt but not to be confused with the Arab Revolt of 1916–1918, was motivated largely by the outcomes of World War I. In particular, two international policy decisions—the issuance of the Balfour Declaration (November 1917) and the granting of the British Mandate for Palestine (formally recognized in July 1922)—directly encouraged the events leading up to and during the revolt.

The Balfour Declaration and the subsequent mandate both sought to reinforce a pro-Zionist policy that aimed to promote the establishment of a Jewish national home in Palestine. During the first decades of the twentieth century increasing numbers of Jewish immigrants, mostly from Europe, motivated by the ideals of political Zionism, immigrated to the region. This influx of immigrants and their acquisition of land

A group of Arab prisoners in the Old City of Jerusalem (in the British Mandate of Palestine) is guarded by a British soldier armed with a rifle and bayonet on October 26, 1938, during the Arab revolt against British rule and Jewish settlement in Palestine. (Hulton/Archive by Getty Images)

► IZZ AL-DIN AL-QASSAM

Izz al-Din al-Qassam was born in Jabla, Syria. A participant in the 1921 revolt against the French, Qassam fled to Haifa shortly thereafter. Once in Haifa, he turned his efforts on recruiting local *fellahin* (peasants) to rise up against the imperial forces in the region. The Salafiya movement and the ideological underpinnings of local Sufi groups inspired the one-time al-Azhar student. Qassam's rhetoric was imbued with patriotic overtones and carried a distinctly Palestinian nationalist message. Reports indicate that Qassam recruited as many as 800, perhaps as few as 200, *fellahin* leading up to his call for revolt in 1935. Playing on the popular

memory of the legends surrounding the assassins, Qassam's message was one at once religious, militant, and patriotic. Qassam was killed in a early battle against British policy, one for which the group was probably ill-prepared. His early death achieved for him a position as local hero, and his grave became a pilgrimage site. As recently as 2008, the military wing of Hamas, known as the al-Qassam Brigades in commemoration of this early anti-imperialist activist, fired rockets into Israel, calling them Qassam rockets.

—Marianne Rhett

added to the frustration over continued British rule (frustration felt by both native Palestinians and Zionist Jews alike). Coupled with the ideological underpinnings of Palestinian national consciousness, these factors combined to produce a volatile environment. Set against the global backdrop of the economic and political uncertainty of the interwar years, the Palestinian Revolt was first triggered by Izz al-Din al-Qassam's encouraged uprising against Jewish settlers and British officials in November 1935 and then by his death shortly thereafter.

On April 13, 1936, two Jews were murdered in the mountains outside of Nablus, and the revolt reached a high-water mark of violence. Soon thereafter the Arab Higher Committee was formed. The committee was a loose representative body for the Palestinian people, primarily concerned with the future of the region in terms of political formation. Led in large part by Muhammad Hajji Amin al-Husayni, the committee called for a general strike. The main demand of the strike was the halting of Jewish immigration to the region. According to some estimates, as many as 60,000 Jewish immigrants fleeing the growing threat of Nazism had come to Palestine in 1935, and this population pressure was causing havoc for the Palestinian economy and politics. Between 1936 and 1939 British forces were steadily increased, and thus by 1939 the Arab militias and guerrilla forces were fighting a British military force of nearly 20,000, aided by the Royal Air Force and local Zionist groups. During the course of the revolt, Palestinians, Jews, and

Britons were all killed in the crossfire. Arab casualties reached nearly 20,000. When the British forces, aided by local Zionists, were finally able to halt the revolt in 1939, it had become abundantly clear to the mandatory administration that changes to the policies of Palestine were necessary. For the first time, a clear and deliberate plan for the future of Palestine was set out in the White Paper of March 1939. Over the next five years Jewish immigration was to be limited to only 75,000, land sales would be more strictly regulated, and within ten years an independent Palestinian state was to be developed, one that hopefully would be agreeable to both the Arab and Jewish populations in the region. However, the Munich Pact of September 1938 and the subsequent world war changed the direction of Palestinian politics once again.

The Russian Revolution (1905)

At the turn of the twentieth century, imperial Russia was ruled by an autocrat whose authority was unchecked by any kind of constitutional or par-

liamentary restraint. Although Tsar Alexander II (1855–1881) had initiated a series of comprehensive reforms—known as the Great Reforms—including the emancipation of the serfs, he failed to introduce a parliament or even a consultative forum where social and political issues could be discussed. After his death in 1881 political repression increased, and a militant underground revolutionary movement grew stronger. The Socialist Revolutionaries, who aimed their appeals at the peasantry, and the Social Democrats, who divided in 1903 between Bolsheviks and Mensheviks and who sought the support of Russia's small but growing working class, were this movement's most important organizations.

In 1904–1905 Russia was engaged in the Russo-Japanese War in which armies of up to 150,000 men fought along 50-mile fronts, making it a large war by contemporary standards. Taking advantage of the fact that the war was going badly for Russia, liberals escalated their demands for constitutional reforms. After the fall of Port Arthur (December 1904), a strike began at St. Petersburg's mammoth Putilov engineering works. On January 9, 1905, tsarist troops fired on a large but peaceful demonstration, killing or injuring hundreds. Some of the protestors were shot in the back as they tried to flee. Bloody Sunday, as this event became known, set off a wave of strikes and disorders that collectively came to be called the Revolution of 1905.

Urban workers, seeking better wages, eight-hour workdays, and an end to abusive treatment by factory foremen, posed the most serious challenge to the government. Skilled metalworkers, machinists, and railway men often organized large strikes, while bakers, clerks, tailors, and other skilled and semiskilled laborers frequently struck as well. Although the socialist organizations did not generally control or direct these strikes and factional bickering sometimes hurt their cause, socialist agitators did help convince workers to escalate and politicize their demands. Many strike demands included the right to assemble and form unions and the creation of a democratically elected parliament.

Other groups rebelled as well. Peasants sought redress of local grievances, such as conflicts over rents. In some areas, for example, the 1861 Emancipation had left peasants with less than half of the land they had worked as serfs.

➤ THE OCTOBER MANIFESTO (1905)

In an attempt to quell widespread rebellion and return order to the Russian empire, Tsar Nicholas II, under the guiding influence of Count Sergei Witte, issued "The Manifesto on the Improvement of the State Order," better known as the October Manifesto, in October 1905. The following are the rights it guaranteed.

"We have therefore ordered the government to take the following measures in fulfillment of our unbending will:

Fundamental civil freedoms will be granted to the population, including real personal inviolability, freedom of conscience, speech, assembly and association.

Participation in the Duma will be granted to those classes of the population which are at present deprived of voting powers, insofar as is possible in the short period before the convocation of the Duma, and this will lead to the development of a universal franchise. There will be no delay to the Duma elect already organized.

It is established as an unshakeable rule that no law can come into force without its approval by the State Duma and representatives of the people will be given the opportunity to take real part in the supervision of the legality of government bodies.

We call on all true sons of Russia to remember the homeland, to help put a stop to this unprecedented unrest and, together with this, to devote all their strength to the restoration of peace to their native land."

However, peasant rebellion, which peaked in November and December when nearly 1,400 rural disturbances were reported, rarely coincided with urban rebellion. National minorities, such as Poles and Finns, also fought for rights. Warsaw experienced some 1,300 strikes during 1905, and hundreds died in clashes with police and soldiers. Violence and guerrilla warfare continued well into 1906 in other outlying cities such as Riga and Baku.

In the autumn of 1905 after the universities were allowed to reopen, many students joined the revolutionary movement. In October

a general strike spread throughout the country, and a beleaguered Nicholas II issued the Октябрьский Манифест (October Manifesto), granting freedom of speech, assembly, and other civil liberties and creating the first parliament (Duma) in modern Russian history. No law was to be enacted without the Duma's approval. Right-wing forces retaliated by inciting a wave of pogroms that killed hundreds, mostly Jews in Ukraine. The October Manifesto satisfied many opponents of the regime but not the radicals. Soviets (Councils of Workers' Deputies) had formed in many cities, providing forums for radical activists. Moreover, mutinies in the armed forces increased in frequency. In June on the battleship *Potemkin* sailors had mutinied in Odessa Harbor, resulting in a massacre in which hundreds were killed. From October through December some 200 military mutinies were reported, convincing radicals that the tsarist system could still be overthrown. However, soldier-mutineers generally targeted squalid conditions within the army or abusive treatment by officers and rarely coordinated their efforts with civilian uprisings.

In December the government put down an armed rebellion in Moscow where 1,000 people died and overwhelmed rebels in towns such as Kharkiv, all but ending the revolution. Cumber-some elections to the First Duma were held in the spring of 1906. It was dominated by the liberal Constitutional Democratic (Kadet) Party, which carried on the fight for further democratization and social reform. When Nicholas II dissolved the Duma, defiant reformers challenged the government's right to levy taxes or conscript soldiers, but in 1907 Nicholas managed to limit the Duma's franchise primarily to the propertied elite, thus ensuring a more conservative body.

Although Russia remained a police state after 1905, the tsar's powers were no longer absolute. Political parties continued to exist as did trade unions, although labor activists were often harassed. Three additional Dumas were elected, with the Third and Fourth Dumas each sitting for about five years. The press also gained a greater ability to discuss and criticize public policy. Ukrainians and other national minorities were now free to use their languages in written form. Those who had been victimized by social,

legal, or national discrimination, having tasted freedom, were now less likely to accept their fate passively. At the very least, the foundations of a law-based constitutional monarchy had been put into place.

Despite intense repression, Russia's subjects periodically manifested demands for more freedom. Workers struck, especially on May Day, and labor activism increased as World War I drew near. Unable to withstand the strains of this war, the tsarist regime finally collapsed in February 1917. The Bolsheviks (Communists) staged a coup in October of that year, and three years of chaotic civil war followed. Stability returned under the New Economic Policy in the 1920s, but in the 1930s Josef Stalin imposed a brutal police state on the Soviet Union that was far more repressive than the tsarist state had been. Opportunities for freedom would not come again until Mikhail Gorbachev initiated a series of reforms in the late 1980s that ultimately led to the collapse of the Soviet Union in 1991.

The Russian Revolution (1917)

The Russian Revolution of 1917 actually consists of two distinct political revolutions that occurred that year, the February (March) Revolution and the October (November) Revolution (according to the Old Julian calendar). Both revolutions involved relatively minor outbreaks of violence but were nonetheless characterized by social upheaval and radical changes in government, foreign policy, and ideological imperatives by all parties involved. The February Revolution, led by

the Provisional Government and the Petrograd Soviet (Worker's Council), formed an interim government to continue Russian involvement in World War I and set up a new government through the Constituent Assembly in an effort to replace the tsarist regime. In the subsequent interim period, the fragile unity between the Soviet and the Provisional Government fell apart, given different interests regarding the continuation of the war, land redistribution, and food supply. This allowed the fringe Far Left Bolsheviks to gain control of the Soviet and call for the dissolution of the Provisional Government, thereby seizing power in the name of the Russian working class.

Early in 1917, the third year of World War I, the Russian armed forces were rapidly deteriorating on the eastern front against the more effective and better-equipped German forces, and this coupled with food supply problems on the home front led to the increasing lack of popu-

larity of Tsar Nicholas II. Both the Duma (Russian legislature) and the Russian High Command convinced the reluctant tsar to abdicate in favor of his son. However, due to the tsarevitch's poor health, he instead gave up his throne in favor of his brother, Grand Duke Michael Romanov, who subsequently declined it, saying that he would only be tsar if he was elected by the people. This left the Duma, with Cadets (Liberal Party) and SRs (Social Revolutionary Party) coalescing in power, along with the tsarist bureaucracy and army. Simultaneously, following a similar pattern as in the 1905 Revolution, soviets were elected among workers and soldiers across much of Russia. The formation of the Petrograd Soviet allowed them access to events in the Duma (henceforth known as the Provisional Government), with which it was in full cooperation. The expectation by the soviets was that this was a matter of course, being a bourgeois revolution that needed to occur in order to create the

➤ ALLIED INTERVENTION IN THE RUSSIAN CIVIL WAR—RESISTING THE FOREIGN IMPERIALISTS

Following the October Revolution, as the Bolsheviks sought to consolidate their power over the newly created socialist state, internal and foreign military forces sought to reverse the situation. In addition to the emergence of White reactionary armies, composed of liberals, conservatives, and monarchists, the Bolshevik forces also had to contend with foreign forces sent by the Entente Powers to protect supplies and evacuations. Britain, France, Japan, Canada, and the United States, among other Allied Powers, sent small detachments in the beginning stages of the Russian Civil War. British and U.S. forces were concentrated in northern Russia, most notably near Arkhangelsk. French and British forces were located in southern Russia along the Ukrainian border. The U.S. and Japanese forces were also engaged in Siberia and the Russian Far East. The Allied intervention gave ample reason for the Russian populace to support the Bolshevik regime, as it allegedly proved the intransigence of foreign capitalists to accept the existence of the world's first socialist state. Ultimately, the intervention missions proved to be of little to no consequence and were mostly withdrawn by 1920. However,

During the Allied intervention to cut off arms supplies to the Russian Revolution, soldiers and sailors from the United States and other Allied countries line up in front of the Allied Headquarters building in Vladivostok, Russia, in September 1918. (National Archives)

they remained part of the Soviet memory as an invasion by the capitalist West.

—Abraham O. Mendoza

conditions for a socialist revolution. This swift and relatively bloodless transition from the failed tsarist autocracy to the dual power arrangement between the Provisional Government and the Petrograd Soviet is known as the February Revolution.

The interim period in the months between the February Revolution and the October Revolution is characterized by the growing schism between the Provisional Government and the Petrograd Soviet, along with the growing influence of the Bolsheviks. The decision to continue fighting the war in order to soothe nationalist sentiment among liberals and the Western Allies had proven unpopular as Russian losses continued to mount against the Central Powers along the eastern front. Minister of War Alexander Kerensky, who supported staying in the war, also served as a liaison between liberals and socialists within the Provisional Government as well as within the Petrograd Soviet and grew unpopular among the masses. This was in stark contrast with his popularity in the early days following the February Revolution. Furthermore, peasant unrest in the countryside, owing to unresolved land redistribution issues coupled with a dearth in food supplies for the cities, increased popular discontent with the Provisional Government. As the working class saw the soviets more in tune with their interests, in contrast with the Provisional Government's preoccupation with maintaining order, the fragile cooperation between the two governing entities rapidly deteriorated. The controversial Kornilov Affair, in which Russian general Lavr Kornilov attempted to stage a coup in Petrograd in the interest of preserving order but was foiled by the Petrograd Soviet,

further exacerbated the situation while also illustrating the relative weakness of the Provisional Government. Demonstrations demanding "all power to the soviets" and "peace, land, and bread" became prevalent in major Russian cities. Increasingly, large numbers of soldiers deserted the front in the hopes of land reforms.

By October, the hopes for cooperation between the liberal Provisional Government and the socialist Petrograd Soviet were dashed by disasters on both the battle and home fronts. The Provisional Government under Kerensky continued to work toward fighting the war and creating a viable government in tandem with the Petrograd Soviet. During this time, the Bolshevik Party, now under Vladimir Ilyich Lenin's leadership, vied to gain control. The October Revolution occurred when the Bolsheviks managed to gain control of the soviets throughout much of European Russia, thereby ultimately gaining access to power through the major Petrograd Soviet. The largely unpopular Provisional Government fell in a coup on October 25, 1917, as the Bolsheviks and their socialist allies stormed the Winter Palace, which housed the Russian interim government. The Bolsheviks quickly established a dictatorship of the proletariat with the historical mission of creating a workers' state from the ruins of the tsarist regime.

■ Introduction: Collapse of Empires

Most of the great European and East Asian empires collapsed during the first half of the twentieth century, destabilized by both external and internal forces. The overwhelming economic and military pressures and stresses of World War I led to

the dissolution of the empires of Russia (1917), Austro-Hungary (1918), the Ottomans (1918), and Germany (1918). At the same time, internal ethnic nationalist movements, upheavals in traditional social relationships, and the political collapse of ruling royal houses also played a

role in their destruction. Likewise, the collapse of the Qing empire in China (1911) was a result of long-standing popular discontent regarding the failure of the royal house to maintain Chinese territorial sovereignty and prevent foreign exploitation. The dissolution of the Japanese empire (1945), otherwise known as the Greater East Asia Co-Prosperity Sphere, was a direct outcome of World War II. Although the military might of the United States was the most obvious cause of Japan's collapse, acts of resistance by occupied nationalities in Southeast and East Asia were also components of Japan's defeat.

Collapse of the Ottoman Empire

Although the Ottoman empire did not collapse until the formal partition of its Middle Eastern territories by France and Great Britain in 1923, the seeds of its dissolution were planted much earlier in the period leading up to the Second Constitutional Era in 1908. During this period, Sultan Abdul Hamid II (1876–1909) sought to regain control of the political and economic decision-making apparatus from the civil bureaucracy and to move forcefully to resurrect the Islamic identity of the Ottoman dynasty. Abdul Hamid was contemptuous of many earlier nineteenth-century reforms instituted during the Tanzimat era, when European governmental practices (e.g., financial, civil, and criminal codes based on the French model) that privileged Western liberal and secular reforms over the absolute rule of the monarch had been the inspiration.

Collectively, Abdul Hamid's centralizing policies, coupled with the revitalization of the empire's Islamic identity, did little to resolve what the British historian Dominic Lieven has termed "the dilemma of empire": the difficulty in reconciling the supranational demands of empire with local calls for more representation and nationalism. Nor, for that matter, would the Young Turks who eventually overthrew him in 1908 have any greater success in this regard. During Abdul Hamid's rule, the Ottoman possessions in the Balkans, which were the empire's geopolitical core

Faisal I, a prominent early Arab nationalist, became the first king of Iraq, a kingdom created especially for him by the European colonial powers following World War I. (Library of Congress)

at one time, shrank considerably: Tunis was lost to France (1881), while Egypt and the Suez Canal were lost to Great Britain (1882). Instability and turmoil were also rampant in the eastern provinces, most notably among the Armenians in eastern Anatolia.

The Young Turks, a group that sprang out of the small, but largely Turkish, Committee of Union and Progress (CUP), directly challenged the authority of Sultan Abdul Hamid on July 3, 1908; restored the 1876 constitution; and reconvened the parliament. The Young Turks Revolution was largely driven by Westernized educated, secular, and Turkish-nationalist army officers and civilian professionals bent on reversing what they regarded as the backward, incompetent, and overly religious course on which the empire had been placed under Sultan Abdul Hamid. Once in power, however, the Young Turks faced the dilemma of empire on multiple fronts: in the western provinces neighboring the newly independent Balkan states and in the Arab provinces caught in the whirlwind of Arab nationalism. The first test for the CUP was the 1911–1912 Turco-Italian War (also known as the Tripolitan War), a comparatively minor conflict in which the Italians easily seized the Ottoman provinces of Tripolitania and Cyrenaica (modern Libya), thus revealing the extent of Ottoman weakness.

The Balkan Wars (1912–1913) pitted the Balkan states of Serbia and Bulgaria in alliance with Montenegro and Greece against the Ottomans. The partition of Macedonia in March 1912, as a result of a secret agreement between Serbia and Bulgaria, prompted the onset of the First Balkan War. The swift defeat of the Ottoman forces in

almost all of its European territories convinced the Great Powers—for whom the collapse of the Ottoman empire would have grave repercussions—to initiate peace talks. On May 30, 1913, the Ottomans were pressured to sign the Treaty of London, which ceded all of their European possessions to the victorious Balkan alliance. The Balkan alliance, however, quickly fell apart as disputes over the newly acquired territories pitted Bulgaria against Serbia and Greece. The outbreak of the Second Balkan War in June 1913 proved to be a fortunate occurrence for the Ottomans, as they were able to intervene (along with Romania) and reclaim some of their lost territories in Thrace.

With the onset of World War I, the successive defeats and losses of territories at the hands of European powers and alliances sparked mass discontent within both the Turkish core of the empire and its increasingly unruly Arab provinces. The Ottoman empire entered the conflict as an ally of Germany. At the time the Ottomans viewed Russia as their most dangerous enemy, so the decision to enter the war on the side of the Central Powers was largely driven by the hope of the possible recovery of lost territories from the Russians (eastern Anatolia and the Caucasus), the Greeks (the Aegean Islands), and the Italians (the Dodecanese Islands). The Ottomans were successful early on in the Battle of Gallipoli and

the Siege of Kut against the French and the British in 1915–1916, but they later suffered devastating defeats at the hands of the Russians during the Caucasus Campaign. Although significant gains—such as the takeover of Azerbaijan—were made, Armenian resistance and widespread revolts in the Arab provinces brought about the effective disintegration of the empire by the end of the war. By 1918 the Ottoman empire was being pulled from every direction by the competing forces of ethnic nationalism.

The Arab Revolt of 1916–1918, led by Hussein ibn Ali in the Hejaz (Arabian Peninsula), coupled with sustained British attacks on strategic Ottoman installations led to the eventual collapse of the empire. On October 30, 1918, the Armistice of Mudros concluded World War I in the Middle East and obligated the Ottomans to renounce their entire empire except for their possessions in Anatolia. The victorious Allies soon undertook the partitioning of the Ottoman empire with the signing of the Treaty of Sèvres (August 10, 1920) under the mandates of Britain and France. The boundaries of this partitioning had been earlier determined by the two powers in the secret Sykes-Picot Agreement (1916). The harsh terms of these treaties, however, brought about the outbreak of the Turkish War of Independence (1919–1923), led by a movement of Turkish nationalists under the leadership of Mustafa Kemal (Atatürk). The Turkish War of Independence resulted in the dissolution of the Ottoman parliament and the establishment of the Grand National Assembly, which convened in Ankara on April 23, 1920, and declared Kemal its first president. The Ottoman dynasty was soon abolished in 1922, and on October 29, 1923, under the terms of the Treaty of Lausanne, the Republic of Turkey was established.

Collapse of the Chinese Empire

The Manchu-ruled Qing empire collapsed in 1911 after a decade of superficial reform and the growing alienation of the majority of the Chinese population. The Empress Dowager Cixi (1835–1908) and senior Manchu officials initiated limited reforms that aided the suppression of domestic uprisings and the resistance against foreign intervention. Yet the empress did not genuinely support reform and chose to engage in the process solely as a means to retain Manchu domination. Chinese reformers became convinced that fundamental government reorganization was impossible and gravitated toward anti-Manchu revolutionary activity. The 1911 Revolution ended Manchu rule in China.

Cixi enacted a series of reforms beginning in 1901. The most significant of these reform policies occurred in the areas of education and the military. Education was the heart of the Qing political system and served as a means of inculcating the social ideology of an orthodox state. Passing the civil service examination required intimate knowledge of the Confucian classics and elevated successful candidates into the social elite of China. The educational reforms struck at this status by establishing a new school system, combining Chinese history and classics alongside foreign subjects, as a second path to government office. These educational reforms encouraged Chinese students to study abroad and altered the contents of the civil service exam to include questions pertaining to Western subjects. The education reforms were similar to those proposed by the Guangxu emperor in 1898, which were suppressed by Cixi and conservative Manchu leaders. These reforms languished due to insufficient funds and the lack of proper facilities and teachers, but they did achieve the abolition of the civil service examination in 1905.

The Manchu rulers also oversaw the creation of a modern military force. Designed to replace the inefficient and obsolete Green Standard

Army and Manchu Bannermen, New Army units were recruited from their home province and stationed at strategic locations throughout the country. Following the abolition of civil service exams, a military career received greater interest and newfound prestige. Officers for these New Army units received training at military academies, and many graduates went on to study abroad, in particular in Japan. Those officers who studied in Japan returned with anti-Manchu sentiments and revolutionary ideals. They served in New Army units that played critical roles in the 1911 Revolution.

The Japanese defeat of Russia in 1904–1905 sent shockwaves throughout Asia. Japan emerged as the leading power in Asia. Chinese reformers looked to the creation of a Japanese-style constitutional monarchy as a remedy for China's continued weakness and failed reform programs. Chinese reformers believed that constitutionalism offered the establishment of civil rights and personal liberty. Others believed that the creation of representative assemblies at the provincial and national levels might subvert Manchu domination. The Empress Dowager and Manchu officials endorsed the creation of a constitutional monarchy as a means to increase control and limit Chinese influence at court. Cixi used the extended debate over constitutionalism, which began in September 1906, to centralize more power in Manchu hands at the expense of weakening the economic and military powers of provincial officials, usually Chinese.

The creation of an outline constitution authorizing overwhelming powers for the Manchu emperor did not change Cixi's distaste for fundamental reform, especially Western-inspired government reorganization. She urged a nine-year delay in its enactment. Even after Cixi's death in 1908, Manchu officials continued to delay enacting elements of constitutional reform in the face of rising Chinese demands to form a national parliament. The final blow to Chinese reformers' constitutional hopes was the creation of the Royal Cabinet in 1911. This cabinet included eight Manchus, five of whom were imperial relatives; one Mongol; and four Chinese. Chinese protests were ignored as Manchu officials cited the powers outlined in the constitu-

tion, which permitted the throne absolute authority over appointments.

While senior Manchu officials delayed and distorted reform efforts, anti-Manchu sentiment deepened. The leading revolutionary in this period was Dr. Sun Yatsen (1867–1925) and his organization, the Revolutionary Alliance. Sun had acquired his education abroad and had become convinced that an armed uprising was necessary to end Manchu domination of China. Sun's political philosophy was contained in his *Three Principles of the Peoples* (*Sanmin Zhuyi*). The three principles were nationalism, which called for the end of Manchu rule and foreign intervention; democracy, to establish a republic based on the idea of popular sovereignty; and socialism, sometimes called "people's livelihood," that promised "land to the tiller." Between 1895 and 1911, Sun and his supporters staged ten revolts.

Growing anti-Manchu sentiment as well as repeated failures to enact substantive reform fanned a revolutionary atmosphere that culminated in the 1911 Revolution. The triggering event was the accidental explosion of a bomb in the city of Wuchang on the Yangzi River on October 9, 1911. When police investigated the scene, they found the student revolutionary bomb makers, revolutionary tracts, and membership lists, the latter of which included the names of New Army officers and troops stationed in the area. Fearing arrest, the New Army units spontaneously initiated an uprising without preparation or leadership. Sun, for example, was traveling in the United States and learned of the revolution by reading a newspaper.

Manchu leadership in the provinces and at the capital failed to meet the challenge. By the middle of November, 15 provinces, following some combination of New Army units, old scholar-gentry, rich merchants, secret society members, and returned overseas students, seceded from the Qing empire. With a stalemate on the battlefield between Qing loyalist and revolutionary forces, the last Manchu emperor abdicated on February 12, 1912.

The 1911 Revolution succeeded in ending 268 years of Manchu rule in China. It also marked the end of a 2,000-year-old Chinese dy-

nastic tradition. The Mandate of Heaven, the Son of Heaven, the Confucian-based moral system, and the civil service exam system were swept aside by the fledgling Republic of China.

Collapse of the Japanese Empire

Japan initiated the building of its Asian empire in the late nineteenth century at the expense of China and accelerated its growth by defeating Russia in 1905. The shocking defeat of a European power by an Asian power elevated Japan's international standing and conferred upon the Asian nation Great Power status. Japan's continued expansion of its empire in Manchuria in the 1930s and its prolonged conflict with China alienated the United States, Great Britain, and the Soviet Union. These ambitions also led to the fateful decision to attack the United States at Pearl Harbor in December 1941. Initial military success quickly ceased, and Japan's surrender in 1945 witnessed the end of overseas empire and dramatic postwar political reform.

By the eve of World War II, Japan had constructed an extensive overseas empire including Manchuria, Korea, Taiwan, occupied areas of China, and island holdings in the Pacific. The conflict in China, initiated in 1937, set in motion the downfall of Japan. Japan's military leaders did not sanction or desire a prolonged conflict with China; rather, they wanted to promote Manchuria's economic development to aid Japan in a future conflict with the Soviet Union. The conflict with China diverted resources from this effort and bogged down the Japanese Army. The Sino-Japanese War demonstrated the limits of

Japan's military capacity to force a resolution and political will to withdraw. The war also heightened tensions with the United States and Great Britain.

As the war in China dragged on, Japan sought diplomatic means to neutralize the reinvigorated U.S. support for China. Japan concluded the Tripartite Pact with Germany and Italy in September 1940. Japan expected this treaty to force a more moderate stance by the United States; instead, it sharpened the American position. The United States extended loans to China, embargoed the shipment of scrap iron to Japan, and insisted upon a Japanese withdrawal from China. When Japan entered French Indochina, the United States froze Japanese financial assets and added oil to the embargo list.

➤ ACCEPTANCE OF THE POTSDAM DECLARATION (1945)

On August 15, 1945, Emperor Hirohito issued a radio broadcast effectively declaring Japan's unconditional surrender and bringing an end to World War II. It was the first time that the people of Japan had ever heard their emperor's voice. The following is an excerpt.

"Moreover, the enemy has begun to employ a new and most cruel bomb, the power of which to do damage is, indeed, incalculable, taking the toll of many innocent lives. Should we continue to fight, it would not only result in an ultimate collapse and obliteration of the Japanese nation, but also it would lead to the total extinction of human civilization.

Such being the case, how are we to save the millions of our subjects, nor to atone ourselves before the hallowed spirits of our imperial ancestors? This is the reason why we have ordered the acceptance of the provisions of the joint declaration of the powers."

Source

Emperor Hirohito, "Accepting the Potsdam Declaration (1945)," Radio Broadcast, Recorded by the Federal Communications Commission, <http://www.mtholyoke.edu/acad/intrel/hirohito.htm>.

The Japanese government, dominated by the military, feared the loss of prestige if it acquiesced to American demands. Instead, the decision was made to challenge the U.S. naval strength and invade Southeast Asia to secure the critical oil and rubber resources necessary for Japan's national security. Following Japan's surprise attack on the American naval base at Pearl Harbor on December 7, 1941, the Japanese Army and the Japanese Navy enjoyed repeated success. Japanese forces seized the British naval base at Singapore, secured the oil resources of the Dutch East Indies, and severed the supply link to China by taking Burma. The Japanese Navy captured the Philippines and established an extensive ring of Pacific island bases to protect the home islands.

To justify its invasion of Southeast Asia, Japan espoused a doctrine of Pan-Asianism and expelled Western colonial rule. Japan promised a "new world order" free of Anglo-American domination and membership in the Great East Asian Co-prosperity Sphere. However, the goal of the Co-prosperity Sphere was not the stated equalization of nations but rather the subordination of other Asian nations to Japan. At first, Southeast Asians rejoiced at the arrival of the Japanese Army as liberators, but the heavy imposition of Japanese political, economic, and cultural policies as well as its brutal practices alienated the populace.

Six months after the flurry of success, the military tide turned irrevocably against Japan. Following the decisive naval battle at Midway in June 1942, Japan was on the defensive against a more powerful American military and remained tied to heavy commitments on the Asian mainland. The U.S. island-hopping campaign in the Pacific, whereby American forces bypassed heavily defended Japanese islands in favor of easier targets, collapsed the buffer created in the early months of the war. Japan's home islands were under repeated bombings, including devastating fire bombing raids by July 1944. An incendiary raid on Tokyo in March killed more than 100,000 people. Cities throughout Japan were systematically devastated. The Japanese populace became weary of war and demoralized.

Even though it was clear that Japan possessed no hope of victory, the Japanese leadership refused to accept defeat. For the Japanese, the

stumbling point was the postwar disposition of the emperor, whom the Japanese people revered as divine. Japanese leaders wanted guarantees that the imperial institution would be preserved and that the emperor would not face war crimes trials. The Allies insisted on unconditional surrender. To compel a resolution, the United States dropped the first atomic bomb on the city of Hiroshima on August 6, 1945. Three days later, a second atomic bomb was dropped on Nagasaki. The immediate death toll in the two cities was over 125,000 people, and tens of thousands more later died as a result of radiation sickness.

Confronted by the destructive capacity of this new weapon and the invasion of Manchuria by the Soviet Union, Emperor Hirohito personally intervened to accept the Allied demands. On August 15, 1945, the emperor made a public broadcast to the Japanese people to surrender. After the war, Japan relinquished its overseas empire and experienced dramatic political reform at home. The imperial institution was preserved, but the emperor renounced his claim of divinity. A new constitution, shaped in fundamental ways by the occupying American administration, ushered in a new political order in Japan.

The Collapse of the Tsarist Russian Empire

By the end of the nineteenth century, tsarist Russia was a deeply flawed entity that had moved well beyond its political and social apex. The regime's competition with the modernizing West had only intensified its long-term problems, with World

War I (1914–1918) delivering the final blows that brought it down. While Tsar Nicholas II was certainly ineffective in his efforts to preserve the monarchy, it is not certain that someone else or different policies might have been able to save it. The world was a different place following the war, as the demise of the Ottoman, Prussian, and Austrian empires illustrated.

Among the most fundamental problems of tsarist Russia that had resisted attempts at reform were the unmanageable size of the state, the endemic poverty of the agrarian sector, the alienation of the educated and Westernized elite, and the autocratic traditions of the tsar, which stifled creativity and initiative among the citizenry.

The geographical reach of the state—the largest by far in the world—meant that it was always difficult to develop any sense of unity or patriotism among the people, who included many different nationalities and religions. This problem, already recognized by both Peter the Great and Catherine the Great in the eighteenth century, was intensified in the nineteenth century after the Napoleonic era with the spread of nationalism. Although the government tried to use modern communications to strengthen its control, others used the same to spread different messages among the people. When the crisis arrived in 1917, the empire disintegrated as various nationalities seceded one after the other.

Throughout modern Russian history, the agricultural base has been barely adequate to support the needs of the people. Historians use the poverty of Russian agriculture to explain both the communal system of farming that was used in many parts of Russia and the very late development and survival of serfdom in Russia (abolished only in 1861). These two institutions then served as an effective brake on both modernization in the countryside and on industrialization. Moreover, productivity was too low to support much urbanization. Thus, historians also point to the so-called missing middle class in Russia as an unfortunate result of agricultural poverty. When the Russian war effort in World War I descended into catastrophe, it was not long before the soldiers—peasants in uniform, as they were called—began to desert their posts and leave the front to return home and seize the land from their landlords.

➤ RASPUTIN AND THE ROMANOV

Grigori Rasputin (1869–1916) was a Russian holy man who had a tremendous influence in the Romanov royal household in the last days of tsarist Russia. He was able to supposedly heal the hemophilia of the young tsarevich Alexei (heir to the throne) and was also a trusted counselor to both Tsar Nicholas II and Tsarina Alexandra, a situation that was not kindly looked upon by many in the royal household. Rasputin's demands on the royal couple, his undue influence in government circles, and his notorious sexual exploits were the talk of the Saint Petersburg elite and were considered a public scandal for the Romanovs. The legend of Rasputin's prolonged murder, involving his seemingly superhuman refusal to die, asserts that his plotters poisoned, stabbed, shot, and drowned him. Rasputin was murdered on December 29, 1916, because he was seen as part of the decay of the tsarist court and the growing ineptitude of Nicholas II to lead Russia to victory in World War I. As the Russian Revolution ensued, the Bolsheviks and their supporters viewed Rasputin as a symbol of all that was wrong with the Russian autocracy.

—Abraham O. Mendoza

Not only were disgruntled nationalists and impoverished peasants uninterested in supporting the imperial state, but the educated elite in Russia, the intelligentsia, had in large part committed itself to some form of opposition to the autocratic tsar. This opposition included the liberals who sought an expansion of constitutionalism and the powers of the Duma and the revolutionaries who were dedicated to the destruction of the entire political and social order. Among the latter, the Socialist Revolutionary Party was the most popular and devoted itself to the peasantry, while the Social Democratic Party, both the Menshevik and Bolshevik wings, dedicated itself to raising the revolutionary consciousness of the belatedly growing Russian working class, or proletariat.

The crisis itself resulted when World War I overwhelmed the Russian state and destroyed any progress that had been made toward constitutionalism or stability in the wake of the Revolution of

RUSSIAN EMPIRE, 1914

1905. Nicholas II made a fundamental error when he insisted on refurbishing the image of autocracy in Russia by calling on the tradition of Peter the Great and Alexander I (who led Russian troops in defenses against Swedish and French invasions, respectively) and assuming the role of commander in chief of the Russian armed forces. Not only was he inadequate to this task, but when the war effort went badly, the blame fell directly on him. Perhaps even worse, it meant that the political leadership of Russia devolved effectively to Empress Alexandra (a German by birth and an unpopular figure in Russia for many reasons) and her spiritual and political adviser, the bizarre and unsavory monk Grigori Rasputin (1869–1916). Rasputin's influence over Alexandra and thus also Nicholas, a devoted husband and father, stemmed from his ability to stabilize the condition of the Romanovs' hemophiliac son and heir to the throne, Alexis, in moments of medical crisis. Rasputin likely accomplished this by calming the frightened and suffering boy perhaps through hypnosis, thus slowing his blood flow and giving his body a chance to heal. Rasputin was convinced

that it was his God-given mission to save the Russian autocracy from the forces of Western, secular, constitutional reform. He frequently advised Alexandra to ask Nicholas to dismiss certain reform-minded ministers and to limit cooperation with the constitutionally elected Duma. Rasputin's influence was decidedly pernicious and helped to deprive the tsar of any remaining goodwill among the most able political leaders in Russia at the time.

The imperial Russian state fell in February 1917 in the midst of military disaster, the disintegration of empire, the collapse of the Russian war effort, strikes and other disorders in the major cities, and an incompetent government in St. Petersburg. On March 15, 1917, the tsar was confronted by a delegation from the Duma with the demand that he abdicate the throne. This, in great sorrow and no small relief, he did in his own name and that of his ailing son, Alexis, thus bringing to an end both the Romanov dynasty that had ruled Russia since 1613 and also the imperial Russian state. A provisional government that proclaimed itself in the wake of the abdication survived for less than eight months in deteriorating conditions

before itself collapsing in October 1917, giving up power to the Bolsheviks.

The Collapse of the Austro-Hungarian Empire

The decision to go to war in 1914 following the assassination of the heir to the throne of the Habsburg empire, Franz Ferdinand, in Sarajevo would seal the fate of the Habsburg monarchy and lead to the dismemberment of the empire. Once the dominant power in Europe, especially during the sixteenth century (often referred to as the Age of Charles V), by the end of the Napoleonic Wars (1803–1815) its weaknesses were clearly evident. Consistently defeated on the battlefield by the French emperor, the Habsburg monarchy used its hosting of the Congress of Vienna in 1815 to maintain at least the aura of a great power and to help engineer the “concert” of Europe in an attempt to resist future revolutions that might imperil the state. With the emergence of nationalist movements in Europe following the French Revolution, the multinational Habsburg state was threatened by both the awakening of its various ethnic communities and the ever-present danger of war in Europe.

In 1848 revolution in France quickly spread to the Habsburg lands, leading to the resignation of Prince Clemens von Metternich, the architect of the Congress system, and the subsequent flight of the royal family from Vienna. Although Habsburg forces would ultimately suppress the revolutionary movements, most bloodily in Hungary, which had declared its independence in 1849, outside the boundaries of the empire, the Frankfurt Assembly had adopted the *Kleindeutsch* (“Little German”) position, which called for the exclusion of the Habsburg lands from a future German state. Vienna’s primacy in “Germany,” which had dated

for hundreds of years, would soon end in the Austro-Prussian War of 1866.

The crushing defeat at the hands of Prussia forced the government to make concessions to the Hungarians, the most troublesome of its many national groups. The resulting *Ausgleich* (Compromise) with the Hungarians created the Dual Monarchy of Austria-Hungary, a move that temporarily quelled the prospects of internal dislocation but did not address the larger issue of similar nationalist yearnings by the other ethnic peoples of the empire.

While it is often asserted that the Habsburg state was the “second sick man of Europe,” its demise was by no means certain. Austria-Hungary occupied a critical position in the heart of Europe with an intellectual vitality unsurpassed anywhere. Budapest, Prague, and Vienna were centers of culture that saw the musical genius of Richard Strauss, Béla Bartók, Ferenc (Franz) Liszt, and Bedřich Smetana (to name but a few); the birth of modern psychology under Sigmund Freud; the writings of Endre Ady, Ján Kollár, and Franz Kafka, among others; and the art of giants such as Josef Mánes and Alfons Mucha. Nevertheless, nationalism was the empire’s Achilles’ heel, and by the dawn of the twentieth century the state’s inability to deal with its ethnic problems had caused the monarchy to reach a state of virtual political atrophy.

Despite the fact that the *Ausgleich* led to at least a measure of stability between Vienna and Budapest, the compromise did not address the empire’s wider problems, principally the fact that over one-half of its population was neither German nor Hungarian. With the awakening of national consciousness among the other ethnic populations, especially the Czechs and Croats, during the nineteenth century, movements that began as cultural and linguistic revivals by the last quarter of the century had turned increasingly political in nature. The emperor, Franz Joseph, now faced pressure from these groups to extend rights greater than most German or Hungarian political leaders were willing to offer. The Hungarians especially refused to consider expanding the provisions of the *Ausgleich* to include the Czechs, Croats, and other Slavic groups within the empire; this would have resulted in changing dualism to trialism, thereby diluting the

THE OTHER BOLSHEVIK STATE—“RED” HUNGARY

The cessation of formal hostilities in 1918 did not bring peace to Europe, as evidenced by the outbreak of civil war in Russia and the resulting Allied intervention in the new Bolshevik state aimed at toppling the government of Vladimir Lenin. The rise of communism, however, was not limited to Russia. The most significant communist uprising outside of Bolshevik Russia occurred in Hungary, where a “red” (communist) regime, led by Béla Kun, came to power in March 1919 and would last for 133 days. The communist government nationalized banks, collectivized agriculture, and attacked religion, measures that quickly lost the support of much of the population, especially the peasants. Civil war quickly ensued. Meanwhile, in April the Kun government also found itself under attack by Czechoslovak and Romanian forces. In late July, with Romanian troops nearing Budapest and under pressure from Hungarian “white” (anticommunist) forces, Kun fled into exile in Moscow. As the communist government fell the White Terror ensued, a bloody repression that saw thousands killed.

In part because of fears of the Soviet Republic in Hungary, the provisions of the Treaty of Trianon, which formally ended World War I, were the harshest of any directed at the defeated powers. Hungary lost two-thirds of its territory to its neighbors and over 50 percent of its population. As a result, although Red Hungary was long gone, the new government in Budapest remained implacable foes of the Paris Peace Accords, thus further undermining the fragile peace in Central Europe during the interwar years.

—Richard Frucht

advantageous position held by the Hungarians after 1867. Instead, Budapest pursued a policy of Magyarization, the imposition of Hungarian language and culture upon the nationalities in their half of the empire. Likewise, many ethnic Germans, who saw themselves as the true leaders of the state, were angered by the loss of the empire’s “German” character. This led to the emergence of a strongly jingoistic German movement centered in Vienna and Bohemia, a highly charged atmosphere at times anti-Semitic in tone and posture, that would see a young Austrian named Adolf Hit-

ler caught up in its undercurrents. This combination of nationalism, the refusal by Hungarians to extend the rights of the Ausgleich, and an increasing radicalization within the German community proved to be a volatile mixture. Political groups that advocated moderation and political evolution were pushed aside by often younger politicians who were more strident in approach. Thus, any social, economic, or political slights, real or perceived, caused a greater sense of friction and dissatisfaction.

Whether the ethnic tensions would have in the end proven to be intractable, thereby resulting in the internal fracturing of the state, is at best a matter of conjecture. The empire had been resilient in the past, and while some called for the breakup of the empire, those voices were still a minority within the overall population. Instead, it was war that brought an end to the Austro-Hungarian empire.

With its removal from German and Italian affairs following the wars for Italian and German unification, Vienna increasingly directed much of its foreign policy toward the Balkans, the most unstable part of Europe. When Vienna formally annexed Bosnia-Herzegovina in 1908, tensions with Serbia, which saw Bosnia as its rightful territory, rose. On June 28, 1914, Franz Ferdinand was shot in the Bosnian city of Sarajevo by a Serb nationalist, a plot that was reportedly known in the highest quarters of the government in Belgrade. A month later Vienna declared war on Serbia, the act that soon widened into World War I. Like its other great power counterparts, Vienna thought that the war would be over quickly; however, it was to drag on for four years and rip the state asunder.

At first almost all segments of Habsburg society rallied to the cause, but as the war dragged on with no end in sight, nationalist leaders, often in exile, pressed at first for reforms and by 1917–1918 for national self-determination. With the promulgation of U.S. president Woodrow Wilson’s Fourteen Points, the breakup of the empire and the pursuit of national self-determination had become the objective of both the Allies and much of the population.

By 1918 shortages abounded, and strikes were rampant. The new emperor, Karl, who had succeeded Franz Joseph in 1916, could not stem

the tide. By the time Vienna signed an armistice on November 3, 1918, the state had already fractured. Although Karl had not abdicated, he was the emperor of a state that no longer existed.

At the Paris Peace Conferences of 1919, the formal dismemberment of the Austro-Hungarian empire was codified in the Treaty of St. Germain with Austria and the Treaty of Trianon with Hungary. What was once an empire now became a region of small states, often referred to as a “shatter zone.” Austria and Hungary became independent nations, as did Czechoslovakia, which also included lands taken from Germany and Russia. Other parts of the empire were included in the newly reconstituted Poland; the Kingdom of Serbs, Croats, and Slovenes (later known as the Kingdom of Yugoslavia); and Greater Romania. For the victors there was great jubilation; for the vanquished, there could never be acceptance of lost land (Hungary) or the restrictions on joining with Germany (Austria). What had once been the stabilizing force in Central Europe had now become a region of tension and instability and a central factor leading to war two decades later.

Collapse of the German Empire

The German Empire (Deutsches Reich) was formed at the climax of the Franco-Prussian War in January 1871 by the unification of major and minor Germanic states in north-central Europe. These states included the kingdoms of Prussia, Bavaria, Saxony, and Württemberg and almost two dozen other territories and free cities. The

kingdom of Prussia was the dominant force in the new nation of Germany (Deutschland) and the king of Prussia became the German emperor (*Deutscher Kaiser*). Stretching from France to Russia as a unified and industrialized state with a powerful military, Germany’s establishment altered the balance of power in Europe. When Wilhelm II (1859–1941) acceded to the thrones of Prussia and the German Empire in 1888, his policies to make Germany a world power soon created a coalition of enemies that along with Germany’s own internal growing social, political, and economic contradictions would see the empire and monarchy overthrown in a revolutionary upsurge in November 1918.

The empire’s constitution gave the elected German parliament, the Reichstag, little actual power. Foreign and defense affairs were in the hands of the kaiser, and he appointed all government ministers who were responsible only to him and not to the Reichstag. As king of Prussia he directly ruled the wealthiest, largest, and most populous state of Germany, which had veto power in the Reich’s upper chamber, the Bundesrat, regarding any constitutional reform. The Reich’s rapid economic growth after 1871 increased the size of its working and middle classes; however, the suffrage system favored the sparsely populated rural areas that were controlled by the conservative Prussians and other aristocracies over the densely populated urban areas such as Berlin, Hamburg, and the Ruhr. Because the Reichstag was not the power center of imperial Germany and the political system was heavily autocratic, domestic politics after 1900 became very polarized, with the new working class in particular calling for major political, economic, and social changes. Its political voice quickly became the Marxist-inclined Sozialdemokratische Partei Deutschlands (Social Democratic Party, SPD), which became the largest party in the Reichstag in 1912 with 34.8 percent of the vote and 27.7 percent of the seats. This victory created a crisis for the ruling class, who regarded the socialist, anti-imperialist, and anti-monarchical SPD as unpatriotic and subversive.

In response to the growing support for the SPD in the period after 1900, German ruling circles followed a nationalistic military and foreign policy to rally middle-class and peasant support

➤ EMPEROR WILHELM II

Wilhelm II (1859–1941) was born on January 27, 1859, in Berlin. Early in his life he developed a penchant for a belligerent, tactless, and impulsive approach to problems and people, and this outlook stamped his personal and political life until his death. On June 15, 1888, Wilhelm became the German kaiser. Having come to the throne with the idea that he was going to govern as well as reign, he forced the resignation (1890) of the chief political architect of the German Empire, Otto von Bismarck (1815–1898), who had served as chancellor since its inception in 1871. With the cautious Bismarck gone, Wilhelm embarked upon a so-called New Course in which he hoped to exert decisive influence on the government of the empire, make Germany a major colonial power, and create a formidable navy. These goals and his belligerent style brought Germany into an arms race with other European powers and ultimately into World War I in August 1914. Despite his love of the trappings of militarism, he had little military experience and was mentally and emotionally unable to play the role of a wartime leader. By 1916 the empire had effectively become a military dictatorship under the control of Paul von Hindenburg (1847–1934) and Erich Ludendorff (1865–1937). A mutiny in the German Navy and the beginning of the German Revolution in early November 1918 coupled with Germany's impending defeat by the Allies forced Wilhelm to abdicate as German emperor on November 9, 1918. He died in exile at Doorn in the Netherlands on June 4, 1941.

—Alexander M. Zukas

for the political and social status quo. In particular, a desire for greater prominence on the world stage (*Weltpolitik*) led to a massive rearmament program after 1900 that included the creation of a high seas battle fleet and allowed the government to find parliamentary majorities for its major pieces of legislation. German foreign policy and rearmament so alarmed Britain that it allied itself with France in 1904 and with Russia in 1907, bringing forth the very specter that German policy meant to avoid: encirclement. Increasing social unrest led to a series of major strikes in 1912, and the imperial government entertained plans to repress the German working-class movement with military force in a state of

emergency. By 1913 politics in Germany had become polarized between those who wanted to make the Reichstag into the center of political decision making and those who wanted to preserve the monarchical order or create an even more dictatorial state if necessary to preserve their property, prerogative, and status.

The kaiser and his advisers linked civil unrest and foreign war in their minds. They believed that Germany's external and internal enemies aimed to destroy the monarchical order. The chief of the German General Staff, Helmuth von Moltke (1848–1916), believed that Germany would lose its military edge to its enemies by 1916 at the latest, so the earlier Germany went to war, the better chance it had of winning. The assassination of Austrian archduke Franz Ferdinand (1863–1914) gave the German General Staff the opportunity to fight a war that, if won, would stabilize the German monarchy's international and domestic positions.

In August 1914 Germany declared war on Russia and France. In the same month commanding generals were authorized to secure law and order in their districts, censor news, and observe opponents of the regime. Their authority stemmed from the 1851 Prussian Siege Law, which was invoked in case the SPD, which vocally opposed war, voted against war and war credits or mounted street demonstrations. The military was ready to arrest SPD Reichstag members and use lethal force to break up demonstrations. However, the SPD did vote to support the war and agreed to a *Burgfrieden* (domestic peace) for the duration of the war. Popular support for the war was high, and everyone expected that it would be over by Christmas 1914. The war, however, dragged on for four more years, and the cost to Germany was staggering: 2.4 million war casualties and 300,000 civilian deaths from disease and malnutrition.

The war was devastating for the German economy. The banking system was badly disrupted, and export-oriented businesses, the engine of German economic growth, lost their overseas assets and markets. Furthermore, inflation spun out of control, money became devalued, and consumer prices more than doubled. As the war became a stalemate, armament production was given a high priority and culminated in

the Hindenburg Program of 1916 that set production targets, prices, and wages and further militarized the German economy. Most Germans, especially workers, saw their living standards drastically reduced. Rationing helped, but black market items commanded a better price. Poor harvests in 1916 and 1917 made the situation catastrophic, and malnutrition and starvation became common. Food riots, demonstrations, and strikes occurred frequently despite martial law. Organized by revolutionary shop stewards and workers' councils, the first mass strikes occurred in April 1917. In one strike, 200,000 workers walked out in Berlin alone, and civil unrest became a daily event in much of the nation. This popular upsurge encouraged left-wing politicians to found popular radical movements such as the Independent Social Democratic Party (USPD) and the Spartacus League that gave political voice and organization to massive grassroots discontent.

Erosion of support for the monarchy was growing, and in January 1918 strikes of more than a million workers occurred in major German cities. The polarization of German politics had reached the breaking point. Despite the withdrawal of the Soviet Union from the war in March 1918, the German General Staff realized by September 1918 that Germany was going to lose the war. In October 1918 the USPD called for the overthrow of the monarchy and the installation of a socialist republic. An 11th-hour

conversion of the autocratic German political system into a constitutional monarchy in the same month failed to attract popular support. Instead, a revolt by sailors at Kiel on October 30 launched a revolutionary movement across Germany. After years of material deprivation, left-wing agitation, and pent-up anger at the inequalities and injustices of the old regime, masses of workers, soldiers, and sailors wanted it swept away. The German Revolution of 1918 had begun. On November 7 Kurt Eisner (1867–1919) of the USPD proclaimed a socialist republic in Bavaria, and faced with mutinies and revolutionary upheaval, the kaiser abdicated on November 9, 1918. With this act the German monarchy and empire collapsed, and the SPD, USPD, and the Workers' and Soldiers' Councils of Berlin proclaimed a German Republic.

■ Introduction: The Mandate System

Although the 2003 Iraq War has focused worldwide attention on the Middle East, the region has had a long and often troubled history of foreign intervention. Outside influence in the area during modern times began with World War I. The global nature of the war brought Allied troops to northern Africa and the Middle East to combat the Ottoman empire, which had joined the Central Powers in late 1914. British authorities encouraged the local Arab population, which had suffered under Ottoman rule for years, to rebel. The subsequent

Arab Revolt (June 1916–October 1918) was spearheaded by Husayn ibn Ali, the sharif of Mecca, who had been given assurances of support from British high commissioner in Egypt Sir Henry McMahon.

After the defeat of the Ottoman empire and the end of World War I, the victorious European allies quickly carved up the region for themselves. The Treaty of Sèvres (1920) removed all Arab regions from the control of the newly created nation of Turkey. Saudi Arabia was made a nominally independent state, while the rest of

the Middle East was divided into League of Nations mandates. Through this system Syria and Lebanon came under French control, while Iraq and Palestine came under British control. Although the 1923 Treaty of Lausanne returned several territories to Turkey, the mandate system remained in place.

The colonial period in the Middle East lasted until the mid-1940s, despite growing Arab nationalism. Although Iraq was granted independence on October 3, 1932, the other mandate territories did not receive independence until during or immediately after World War II: Lebanon on November 22, 1943; Syria on April 17, 1946; and Jordan on May 25, 1946. Palestine, the last Middle Eastern mandate to gain sovereignty, became the State of Israel on May 14, 1948. That decision, perhaps the most controversial move made by a foreign power regarding the Middle East, was based in part on the 1917 Balfour Declaration, which stated that the British government “view[ed] with favour the establishment in Palestine of a national home for the Jewish people.”

The Middle East quickly became an important theater in the ensuing Cold War. In addition to the region’s inherent economic and strategic value to foreign nations, it now became a proxy battlefield in the conflict between East and West. The Suez Crisis of 1956 highlights the nature of foreign intervention in the Middle East during that period. In 1956 Egyptian president Gamal Abdel Nasser decided to nationalize the Suez Canal Company in order to finance the creation of the Aswan High Dam. Although he promised to compensate foreign shareholders, this decision infuriated Great Britain and France, which had previously received a majority of the company’s profits. In addition, the French government was furious with Nasser’s support of anti-French campaigns in nearby Algeria and Morocco. The two aggrieved European powers found a regional ally in Israel, which had been warring with Egypt since its establishment and considered the nationalization of the canal a threat to the safety of its own shipping. The joint military campaign, however, was cut short by the entrance of the United States, which considered Egypt an important Cold War ally.

—*Maxine Taylor*

Role of the League of Nations in the Mandate System

At the end of World War I, with the dissolution of the German, Habsburg, Russian, and Ottoman empires, the League of Nations instituted a series of guidelines in terms of distributing the former colonial possessions of the aforementioned polities. While the principle of self-determination was utilized for the creation of new states from the former Habsburg and Russian empires in eastern Europe (e.g., Czechoslovakia, Poland, and Yugoslavia), this was not extended to the non-European populations of the defunct Ottoman and German empires. Britain and France, which were the primary powers of the League of Nations, given the exclusion of Soviet Russia and the reluctance of the United States to join, established a system of mandates to rule these territories under the auspices of the League of Nations. Article 22 in the Treaty of Versailles (1919) stipulated the provisions under which these territories would be administered by the mandatory power. However, this status created a situation in which the Mandatory power ruled the territory as a de facto colonial possession, fostering resentment of foreign domination and European hegemony during the interwar period in these myriad regions.

Article 22 roughly assigned three different categories of mandates that were set up along differing sets of criteria that depended on the suggested “level of development” of said people, according to European standards, albeit with paternalist and racist overtones. The Council of the League of Nations stipulated more concrete guidelines as to the character and type of administration of mandates in 1920. The first category of mandates were designated as Class A mandates, which were deemed to have reached a level of development that made them suitable to complete independence upon a short period of tutelage by a mandatory power. Class A mandates were exclusively former Ottoman territories in the Middle East, which included British Transjordan, Mesopotamia, Palestine, and French Syria (which included Lebanon). These were akin to the territorial adjustments agreed to by Britain and France known as the Sykes-Picot

Agreement (1916). These remained mandates until after the end of World War II with the exception of Mesopotamia, which became the independent state of Iraq in 1932. While sections of Turkey proper were promised to Italy and Greece as mandates, these never materialized due to Turkish resistance to the dismemberment of control of Anatolia and Constantinople by the Allies.

Those territories designated as Class B mandates were all former German colonies in sub-Saharan Africa. These were deemed to need a longer period of mandatory administration given their relative level of development vis-à-vis European industrialization and political structures. Belgium was assigned to administer Ruanda-Urundi (modern Rwanda and Burundi), and Britain was assigned to administer Tanganyika (formerly German East Africa, now modern Tanzania), while Togoland (modern Togo) and Kamerun (modern Cameroon) were divided and administered by Britain and France. Given that these were adjoining existing Belgian, French, and British colonies, they were put under the administration of these established governing authorities. While these were mandates of the League of Nations, they were administered as de facto colonies of the mandatory power.

Class C mandates included all former German possessions in the South Pacific and German Southwest Africa. These were deemed to be exclusively administered by colonial authorities of said mandatory power given the lack of development or isolated nature of these territories according to the standards stipulated by Article 22. Many of these were scattered islands in the South Pacific that were divided among Australia, Britain, Japan, and New Zealand. The largest of these, former German New Guinea (modern Papua New Guinea), was granted to Australia for mandatory administration. German Southwest Africa (modern Namibia) was assigned to be administered by the Union of South Africa.

➤ TREATY OF VERSAILLES, ARTICLE 22 ON MANDATES

“To those colonies and territories which as a consequence of the late war have ceased to be under the sovereignty of the States which formerly governed them and which are inhabited by peoples not yet able to stand by themselves under the strenuous conditions of the modern world, there should be applied the principle that the well-being and development of such peoples form a sacred trust of civilization and that securities for the performance of this trust should be embodied in this Covenant. The best method of giving practical effect to this principle is that the tutelage of such peoples should be entrusted to advanced nations who by reason of their resources, their experience or their geographical position can best undertake this responsibility, and who are willing to accept it, and that this tutelage should be exercised by them as Mandatories on behalf of the League. The character of the mandate must differ according to the stage of the development of the people, the geographical situation of the territory, its economic conditions, and other similar circumstances.”

—Abraham O. Mendoza

British Mandates

Mandates were granted to Britain and France at the settlement of World War I at Versailles in 1919 as an expeditious way of dealing with the former colonies of the Central Powers. The mandate system was set up in tandem with the organization of the League of Nations to grant the Entente Powers the responsibility of administering former German and Ottoman colonies. The mandate

British general Edmund Allenby enters the Old City of Jerusalem through the Jaffa Gate on December 11, 1917, after capturing the city. Following World War I, the British helped to establish a Jewish state in the region through their administration of the Palestinian Mandate. (Library of Congress)

system worked on the logic that the newly liberated colonies were not considered capable of self-government and that with European administration, after a number of years or perhaps decades, peoples living under mandates would be allowed to self-govern and eventually gain independence. In reality, the populations of the mandates found themselves transferred from the domination of one colonial master to another.

During World War I, British involvement in the Middle Eastern theater of war was characterized by the manipulation of Arab and Jewish nationalisms in addition to attempting to placate French ambitions in the region. In addition to the Sykes-Picot Agreement (1916) with France and the Balfour Declaration (1917) promising a Jewish homeland in Palestine, British strategy in the region and the potential for expanding its re-

gional influence were complicated by providing support and military aid to Arabs fighting against the Ottomans. Initially British military objectives involved securing a wedge in the Ottoman empire to allow the opening of a second front in the East and increased links with Russia. As first lord of the Admiralty and a key war cabinet member, Winston Churchill's stubbornness on opening up a second front in Anatolia led to the Gallipoli fiasco resulting in the butchering of Australian and New Zealander Army Corps (AN-ZAC) troops at the hands of the Ottomans. The failure of this policy shifted British strategy from direct military engagement to one of using diplomacy and intelligence to utilize nascent Arab nationalism as a tool against the Central Powers to supplement British military strength in the region. Ironically enough, the Foreign Office already had plans with France to divide the Middle East from the spoils gained from the Ottomans through the Sykes-Picot Agreement.

Following the war, with the assignment of mandates under the authority of the League of Nations, Britain found itself with the responsibility of administering Palestine, Transjordan, and Iraq in the Middle East and Tanganyika (Tanzania) in Africa. Formerly having backed Arab nationalism and now serving as a mandate power in the Middle East soured Britain's relations with former allies in Arabia and Mesopotamia. The switch from coal to oil by the British Royal Navy also gave Britain a motive to administer Iraq as British oil companies converged on Mosul in the northern region of Iraq. The tenuous relationship with France during the war complicated matters further due to the disagreements over French ambitions in the region and the feeling that they had not gotten all the spoils that were coming to them according to the conditions of the Sykes-Picot Agreement. This very agreement was seen by Arabs as evidence of British duplicity during the war because the agreement contradicted a series of correspondences between the British high commissioner in Egypt, Sir Henry McMahon, and Sharif Hussein of Mecca.

While the Balfour Declaration promised a Jewish homeland in Palestine to Zionists in Europe and Palestine (seen as potential allies against the Central Powers in the war), the re-

traction after the war to appease Arab nationalists fell on deaf ears. Jewish immigration to Palestine continued in limited numbers but enough to enrage local Arabs against the British authorities. Clashes between Palestinian Arabs and Jewish migrants became endemic. These issues resulted in both sides distrusting the motives of Britain in the region and planted the seeds of the Arab-Israeli conflicts of the later twentieth century.

British strategic objectives in the region involved securing communication and trade links with India, the most important and lucrative imperial dominion, and ensuring oil supplies for the Royal Navy. However, the high cost of World War I resulted in Britain having to cut military expenses considerably, resulting in the overreliance of the British military on the innovative tactic of aerial bombardment. Revolts in Iraq and Palestine were dealt with severely through this new military procedure. Although cost-efficient and versatile, one significant effect of aerial bombardment was its creation of further resentment against Britain's presence in the region.

The interwar period and the end of World War II saw Britain's global influence dwindle dramatically. Iraq was granted independence in 1922 after having assured an alliance with Britain. Partly due to the depleted state of British military presence in the region, some Arab nationalists, both in Palestine and Iraq, began to display sympathies with German National Socialism to counter British occupation and Jewish migration into Palestine. While living in exile in Germany throughout the war, the mufti of Jerusalem, Muhammad Amin al-Husayni, rallied for National Socialist support of an independent Arab state; the defeat of Germany dashed any hope of German assistance toward that end.

World War II exhausted Britain's military and financial resources, leading to a loosening of ties in the region. Transjordan emerged as a fully independent state in 1946. Britain's frustration with Arab and Jewish in-fighting in Palestine and Zionist terrorist attacks against their own occupational forces led them to abandon the problem to the newly formed United Nations. This led to the creation of the State of Israel in May 1948.

➤ IRAQ AND NATIONAL SOCIALISM

During the interwar period (1919–1939), Britain saw its power projection across the world decline in relation to the growing strength of National Socialist Germany. The imperial domination of much of its colonies rested on its naval and military strength, which was in peril due to the economic tribulations of the Great Depression. The Kingdom of Iraq, created out of the mandate granted to Britain in settlement at Versailles in 1932, was set up as a puppet regime subject to British military strategic necessities. Resentment against Britain's presence in the region due to oil reserves in the northern provinces of Iraq led a group of army colonels to stage a coup. This resulted in the installation of Rashid Ali al-Gaylani as prime minister. Antagonism against Britain made Rashid Ali sympathetic to the German National Socialists, flush with victories in 1940 with the fall of Norway, the Low Countries, and France. Britain saw this flirtation with the Nazis as a threat to their control of the region. The 1932 treaty recognizing the sovereignty with Iraq necessitated that it subject itself to British military authority and oil interests. Rashid Ali took a stand against British demands for a naval base in Basra, triggering hostilities. The British crushed this revolt and occupied the country during the remainder of the war.

—Abraham O. Mendoza

The long-term impacts of the British system of mandates in the Middle East and Africa were the instability created by artificial borders, the secret treaties with France and Zionists to divide up the region, and resentment for supplanting previous colonial domination in the form of benign international authority while simultaneously propping up Arab nationalists. This instability was characterized by the contemporary in-fighting between Shia and Sunni Muslims as well as Kurds in Iraq and Israelis and Palestinians in the Levant.

French Mandates: Syria and Lebanon

After the defeat of the Ottoman empire in World War I, the victorious Allies divided the empire's Arab provinces (present-day Iraq, Syria, Lebanon, Jordan, and Israel) between themselves. During the war Britain, which had occupied the region, promised Feisal ibn Hussein, the leader of the Arab Revolt, leadership of a united state including all these territories but also promised Syria, Palestine, Transjordan, Lebanon, and Mosul to France and promised Palestine to the Zionist movement. In 1918, however, Britain changed the agreements, retaining control over Palestine, Transjordan, and Mosul and leaving the French a free hand in Syria.

Because America's help had been crucial to winning the war, Britain and France had to support Woodrow Wilson's Fourteen Points, including the right of self-determination, and were unable to impose direct colonial rule in the conquered areas. Instead, they ruled them as mandates for the League of Nations. The mandates were meant to be stepping-stones on the way to full independence for the local populations, and the occupying powers were supposed to help the populations become ready for independence, but in practice they allowed traditional colonialism to continue under a new guise.

Feisal had set up an independent state in Syria, but in July 1920 the French overthrew his government and established direct rule. France had wanted to rule Syria because of the long-standing French role as protectors of the Christian Maronites in Lebanon and because of the large investments in infrastructure France had made in Syria. Now in possession of the land, France practiced a policy of divide and rule.

France separated the Bekaa Valley from Syria and attached it to Lebanon, which before that had consisted only of Beirut and the Lebanon Mountains, and divided the rest of Syria into separately administered states centered around Damascus and Aleppo as well as semi-independent areas for the Alawites and the Druze, two minority groups within Syria. These political arrangements changed every few years, making the region unstable. This combined with the practice of attaching to every Syrian official a French adviser with powers to countermand any order prevented any strong local leadership from emerging, with disastrous consequences after the French withdrew from the region.

In July 1925 a revolt began in the Druze region in response to French land restructuring. Led by Sultan Atrash, the Druze chieftain, the rebels drove the French from the region. News of the Druze successes caused the revolt to swiftly spread through the rest of Syria until in the spring of 1927 large-scale French reinforcements reasserted control. The Great Revolt, as it became known, was extremely destructive, killing 6,000 Syrians and leaving many more homeless. It also led the French to change their system of governance for Syria; rather than direct control, they would rule through local collaborators. The most important of these groups was the National Bloc. Composed of members of Ottoman-era elite urban landowning families and local government figures, the National Bloc engaged in a practice that came to be known as Honorable Cooperation. Under this, they adopted and encouraged the anti-French sympathies of the people while preventing violence on the scale of the Great Revolt. The French, glad to find allies who would control the people for them, accepted them as local elites and ruled through them. Because France was determined to maintain close control and refused to sign a treaty spelling out its intentions and limiting its power, the National Bloc came to have very little power of its own, and the situation remained predictably unstable.

Lebanon, on the other hand, faced a smoother path to autonomy. This was because the pro-French Maronites, though only 30 percent of the population, were the dominant political group. Although France maintained a similar

system of shadow advisers, Lebanon suffered no upheavals similar to the Syrian Great Revolt. The conflict between the Maronites and the Muslims, who found themselves forced into a state that did not reflect their aspirations, was no less intense than the anti-French conflicts in Syria but was expressed more civilly through religious and political local leaders. Under the 1926 constitution, which did not provide Lebanon with meaningful independence, members of the government were elected on the basis of religion. The Maronites sought to turn Lebanon into a Mediterranean country looking to Europe, while the Muslims wanted to stand with the other new Arab states against European domination.

In 1936 the election of Leon Blum's Popular Front coalition led to a French reevaluation of its position in Syria and Lebanon. By the end of that year, France had signed treaties with both mandates, providing for semi-independence and alliance under French protection as well as admittance for Syria into the League of Nations. The treaty, however, was never ratified by the French government and was set aside by a new coalition in 1939, which reimposed direct rule and partition and ceded the district of Alexandretta to Turkey to the displeasure of Syria.

On the eve of World War II, Syria and Lebanon were no more prepared for self-government than they had been in 1920. The upheavals of the war did not improve matters. Officers loyal to the collaborationist Vichy regime took control in 1940, but by 1941 renewed revolts had paralyzed the French occupiers, and in July 1941 British and Free French forces expelled the pro-Nazi government. Britain and the Free French agreed to grant Syria and Lebanon immediate independence, but Charles de Gaulle, the Free French leader, reneged on his promise and reestablished direct control. In 1943, however, elections were held under British pressure, and anti-French parties won power. France continued to assert control until 1946, when French exhaustion and another upsurge of violence forced France to withdraw.

Having been forced to wrest independence from unwilling colonial overlords, the new rulers of Syria and Lebanon had no experience in peaceful self-government and were unprepared to make the transition from revolution to peace-

➤ PRINCE FEISAL OF IRAQ

The third son of Emir Hussein of Hijaz, Feisal (1883–1933) rose to prominence during the Arab Revolt (1916–1918) by his connection to T. E. Lawrence (Lawrence of Arabia). A more skilled statesman than his father or brothers, Feisal won the confidence of the British, who set him up as the ruler of Syria in 1920. The British, however, abandoned him in the face of a French invasion that expelled him later that year. Instead, he was given control of the new country of Iraq. Feisal was the only ruler capable of uniting Iraq's diverse and fractious population, and his untimely death contributed to the country's instability.

British Mandate: Palestine

Palestine became part of the British Mandate during the conclusion of World War I. Looking to secure regional loyalty, British officials promised both Arabs and Jews a national home in Palestine. Although technically the agreements were not in direct conflict, both Arabs and Jews felt threatened and betrayed. As such, the British had set the stage for wide-scale conflict.

The majority of the Jews in Palestine referred to themselves as Zionists, Jews who desired to build a national home in the ancient land of Israel. In this regard, they desired to purchase Palestine and thereby redeem the land through civil versus military means. With funding from American Zionist organizations, the Zionists were able to purchase large quantities of land from Arab landowners. However, Arab

landowners often sold land that was settled by Arab tenant farmers, many of whose families had been living on the same plot for centuries and who viewed the land as their home. In the process, British officials were frequently caught between legal Zionist land purchases and mobs of angry Arab farmers. As a result, the 1920s was categorized by a series of Arab riots and raids interspersed with Zionist retaliation.

The first major Arab raid occurred on March 1, 1920, when hundreds of Arabs gathered at the gate of an isolated Zionist farm known as Tel Hai. Shots were fired, confusion ensued, and the Arabs quickly overcame the local Zionists. The events in 1920 at Tel Hai have become important in that they established the Zionist precedent that no settlement should be abandoned. The next major Arab riot occurred on May 1, 1921, when a group of armed Arabs gathered in Jaffa. The Zionists declared a state of emergency and called upon the British government to intervene. The Jaffa riot received international attention, which helped to create a global awareness of the growing conflict in Palestine between the Arabs and the Jews.

In a vain effort to appease both parties and bring about peace in Palestine, Britain's 1922 Churchill White Paper promoted the idea of a Jewish national home in Palestine while at the same time repudiating the idea that Palestine would become an entirely Jewish nation. This document outraged both Jews and Arabs. The Arab leadership was primarily concerned with the extensive unchecked Jewish immigration into Palestine, which was threatening to upset the existing labor pool and economic system as well as jeopardize the Arab majority. In response to Arab trepidations, the British government began to restrict Jewish immigration to Palestine, although illegal Jewish immigration continued through a system known as *Aliyah Bet*.

Violence continued, and on the morning of August 23, 1929, thousands of armed Arabs gathered at the Temple Mount in Hebron and began to pray. By midmorning several shots were fired, and Arab mobs attacked Jewish peasants. These events led to a series of riots that continued until the following evening. Miraculously, almost two-thirds of Hebron's Jews were saved, being hidden in Arab homes whose inhabitants risked

their own lives to save the Jewish community. The riots at the Temple Mount were the deadliest the region had seen to date.

Unable to prevent and control regional violence, Britain issued the 1930 Passfield White Paper, which further limited Jewish immigration to Palestine. This new British policy also promised to accurately represent Palestine's Arab majority in the Palestine legislative council. Although the British government soon recanted, Zionists were outraged. In 1931 a small group of revisionist Zionists formed the *Irgun Zvai Le'umi* (National Military Organization) in order to efficiently combat British intimidation. Known by its Hebrew acronym, *Etsel*, the organization was an early terrorist unit. Together with its sister organization *Lohamei Herut Yisrael* (Fighters for the Freedom of Israel), known as *Lehi*, the groups led Zionist raids of Arab villages and targeted and destroyed British infrastructure in Palestine.

Despite favorable legislation, the Arab community in Palestine was also displeased with the British Mandate authorities. Beginning in 1932, Britain granted independence to several of its occupied regions, including Iraq, Egypt, and Jordan. Thus, while their Arab neighbors were realizing independence, Palestinian Arabs remained bound to the British authorities, who in 1936 began recklessly tearing down Arab homes in the name of public improvement. As a consequence, the British often destroyed entire Arab communities with nothing built to replace them.

In April 1936 Arab leadership inspired a large-scale Arab revolt against British Mandate authorities. Demanding an immediate stop to illegal Jewish immigration and reconciliation for unfavorable land purchases, the revolt lasted until 1939, by which point more than 5,000 Arabs had been killed. The onset of the Arab revolt sparked renewed British concern. In 1936 the British Peel Commission investigated the nature of the conflict in Palestine, concluding that a two-state solution, otherwise known as a Palestinian partition, was the only solution to regional strife. This vision was presented to the international community in the 1939 White Paper, which promoted the creation of an independent binational state in Palestine within ten years.

The eruption of World War II did not drastically affect the Palestinian conflict among the

British, the Arabs, and the Jews. British occupying forces continued to unsuccessfully restrict Jewish immigration, Arab riots continued to ransack Zionist settlements, and Zionist terror organizations continued to destroy British infrastructure. In November 1944 members of Lohamei Herut Yisrael successfully assassinated Lord Moyne, Britain's senior official in Egypt. Condemned by the larger Zionist community, the murder of Lord Moyne deeply injured British resolve to ensure a Jewish state in Palestine. However, the horrors of the Holocaust increased international sympathy to Zionism, pressuring Britain to end the violence in Palestine.

On June 29, 1946, more than 100,000 British soldiers surrounded dozens of Zionists settlements, including Tel Aviv and Jerusalem, and imposed a curfew. The Zionists were left defenseless as the British ransacked Zionist headquarters, confiscating a large number of documents. Plans for Zionist retaliation were immediately enacted. On July 22, 1946, calls were placed warning that bombs placed in the British wing of the King David Hotel would soon be detonated. British officials refused to evacuate. When the bombs exploded, 91 individuals were killed and another

45 injured. Although several Zionist organizations colluded to bomb the hotel, Etzel was solely blamed and soon disassembled.

The British government looked for an immediate solution. On November 29, 1947, the United Nations declared a Palestinian partition, thereby ending the British Mandate. On May 14, 1948, the British left peacefully; the violence between the Zionists and the Arabs was no longer Britain's problem.

■ Introduction: Political Transformation in Africa, Asia, and Oceania

Although much of the area remained economically subordinate to Europe and North America during the first half of the twentieth century, Africa, parts of Asia, and Oceania began significant political transformation. Although they did feel the impact of ideological and economic convulsions from abroad, from 1900 to 1945, these regions also underwent independent internal developments that increased their international political clout after 1945. For example, Japan, Australia, India, and China became major players in the world wars, expanding their roles as military and economic powers during this period. Nationalist movements, beset on ousting foreign rule, would prove highly influential in colonized world re-

gions such as the Middle East, East Asia, and Southeast Asia. Moreover, the British dominions, Australia, New Zealand, and South Africa, developed into fully independent states in the interwar period.

—Abraham O. Mendoza

Political Transformation in Southern Africa

At the dawning of the twentieth century, political transformation in southern Africa—currently Angola, Botswana, Lesotho, Malawi, Mozambique, Namibia, South Africa, Swaziland, Zambia, and Zimbabwe—were conditioned by

conflict. These wars and conflicts were primarily between the various European powers and indigenous African polities, the established and recently arrived settlers groups, and the Africans and European settlers. These wars left millions dead; led to the eventual expropriation of African land, rights, and freedom; and created new boundaries with territory assigned to three European Powers: Britain, Portugal, and Germany. Europeans created governments and policies that transformed Africans from independent producers to squatters and wage laborers. A system of male migratory labor left women in rural subsistence economies. African political transformation can be described as both a process of adaptability to and a struggle against European domination.

Some Africans adapted to colonialism as a result of missionary Christianity and education, as both were critical factors in Africans' acceptance of colonialism. The missionaries created an educated class of Africans who became clerks, teachers, preachers, journalists, businessmen, and lawyers and who accepted the ideas of white cultural superiority. Ideologically, they thought nonracialism was possible. They worked for and were committed to bringing about African equality through legislative changes and cultural assimilation. They believed that equality could be achieved through black economic self-determination and political accommodation. For example, in 1912 Pixley ka Isaka Seme, a black European-trained lawyer, brought together other black lawyers and formed the South African Native National Congress. This group conducted itself as a restrained and moderate organization seeking improved conditions and political rights for blacks by peaceful means. The group accepted colonialism and Christianity as civilizing institutions and separated itself from militant resistance to colonialism such as antipass campaigns, bus boycotts, or various workers' strikes.

Less conservative African initiatives and forms of resistance to European rule demonstrated an unceasing struggle for self-determination by African peoples. Outright confrontation by Africans came to an end as the twentieth century began. The last few efforts to evade colonial conquest through war revealed African courage in the face of overwhelming odds and an unwillingness to

submit to arbitrary rule. Some of the final conflicts included the joint 1896–1897 Shona-Ndebele Chimurenga (war) fought against the pioneer column of Cecil Rhodes, the 1904 anticolonial rebellion by the Herero in South-West Africa against the Germans, and the 1906 Bambatha Rebellion in Zululand, Natal.

The collapse of indigenous sovereign states in southern Africa forced the majority of Africans to survive in a colonized world. African political transformation ensued as people struggled to regain their self-determination. The struggles were ongoing for four key groups: peasant communities, independent churches, elitist organizations, and working-class movements.

Throughout southern Africa, unorganized and sporadic peasant protests against poverty and exploitation were waged in attempts to protect land and livestock against taxation and limit demands on forced labor and military conscription. To evade paying taxes, peasants disregarded registration laws concerning age and marriage, and sometimes they attacked chiefs installed by colonial regimes. When all else failed, some peasants simply fled to avoid paying taxes or working on European farms. Organized political resistance was also clear. For example, throughout South Africa from 1913 to 1917 there was a widespread campaign to refuse to pay a cattle-dipping tax, and organized peasants boycotted and destroyed dipping tanks. In 1917 rural women in the Transkei region of South Africa organized a series of boycotts to protest price fixing by Europeans and refused to supply basic commodities on credit. Elsewhere in southern Africa there were sporadic peasant uprisings to fight oppression.

The independent churches offered an institutional framework for the political transformation of both peasants and workers. Within the churches, broad-based protest movements evolved that enabled Africans to express their dissatisfaction with colonialism and the uneven distribution of resources. The number of independent churches in the region grew from fewer than 100 in 1918 to thousands in 1945. Independent churches varied in their response to colonialism, but some promoted explicit insurgent activities. One important example is the first Angolan messianic protest revolt of the Mafalu in

1918. Islamic revisionist movements in northern Mozambique also engaged in uprisings against colonialism, while African independent churches in Mozambique limited their opposition to verbal criticism.

Elitist and working-class political organizations formed by Africans were the key institutions responsible for political transformation. These organizations formed as early as 1900 and began as native associations, native conventions, and welfare societies. Although they were initially organized to improve local matters, petition for African rights, and seek the black franchise, they quickly expanded their activities. Among the first of these numerous organizations were the Cape-based South African Native National Congress (SANNC) and its affiliate, the Transvaal Native Congress (TNC); the Transvaal Basotho Committee (TBC); and the Orange River Colony Native Vigilance Association (ORCVA). In 1923 the SANNC transformed itself into the African National Congress (ANC) to serve all Africans colonized by the British empire. The first president of the ANC was John Langlibalele Dube, a Methodist minister and founder-president of the Zulu Christian Industrial School and the Natal Bantu Business League. The ANC appealed to the British government for African rights through petitions, conferences, newspapers, and delegations. In Angola, lawyer, novelist, and journalist António de Assis Júnior founded the Cuanza Norte alliance in 1916–1917. This alliance linked alienated intellectuals with Mbundu peasants in an effort to protest colonial oppression and the preferential treatment given to the white settler community. Both the ANC and the Cuanza Norte alliance were part of the growing Pan-Africanist movement and an emerging African press that frequently criticized the excessive abuses of the colonial system. Africans formed their own unions, calling for labor strikes that were critical for mass political transformation. International labor unions and social movements also served to promote African nationalism. The Industrial and Commercial Workers Union (ICU), a general union formed in 1919, was the most active and popular organization in rural and urban areas in South Africa at this time. Socialist organizations also began to organize black workers in the 1920s.

By the 1940s, growing discontent led to the creation of additional African community organizations, squatters' movements, and black trade unions. The most well known of these organizations is the ANC's Youth League, founded in 1944 by Nelson Mandela, Oliver Tambo, and Walter Sisulu. As such, a younger, more militant generation of African freedom fighters was organized.

Political Transformation in West Africa

After the European imperial powers had carved up the African continent at the Berlin Conference in 1884, almost the entirety of West Africa fell under the complete control of a European power. As a result, Africa's traditional political order—based on communal and kinship ties—was replaced by artificially drawn boundaries encompassing a multitude of culturally diverse groups. Although at least one colony in West Africa during this time was under the control of either Spain (Spanish Morocco, Rio de Oro), Portugal (Portuguese Guinea), Germany (Togo), and Great Britain (Gambia, Gold Coast, Nigeria, Sierra Leone), the larger part of the region was dominated by France, whose empire spread from the Mediterranean Sea in the north to the Anglo-Egyptian Sudan in the east to the Atlantic Ocean in the west and south.

By the early years of the twentieth century the period of French military conquest had largely ended, and France faced the difficult task of consolidating its territorial gains. French colonial administration followed one of two principles: assimilation and paternalism. The former was the case in the Senegalese principalities of Saint-Louis, Rufisque, Gorée, and Dakar, where France assigned French citizenship with all its legal and political rights to Africans. Accordingly,

these four principalities remained self-governing entities. By contrast, the policy of paternalism was applied in the remainder of the French Empire. It allowed the European colonial administrator to subject Africans to compulsory labor and taxation. The agents responsible for the collection of taxes and the drafting of labor were local tribal chiefs, Africa's traditional rulers. However, the role of the tribal chief was reduced to that of an auxiliary of the French *commandant de cercle* (cercle commander), who had control over the cercle, the smallest of the political administrative units in French colonial Africa. The French also began to impose new chiefs on its colonial population, which meant that traditional ways of selecting them were no longer practiced. As a consequence, French colonial policy led to a complete reorganization of West Africa's indigenous political systems.

Although chiefs in British West Africa were equally responsible for the collection of labor and taxes, they were not incorporated into the colonial hierarchy. While French colonial policy adhered to a centralized pattern of command and relied on a large number of European administrators, its British counterpart—indirect rule—at least theoretically provided traditional rulers with higher degrees of autonomy. London rarely imposed new chiefs and hardly ever broke up ancient chiefdoms to create new administrative structures.

Despite theoretical differences, all forms of European colonial rule in West Africa aimed at exploiting raw materials and at exercising political domination. In both the British and French empires, the transfer of power from traditional rulers to colonial administrators destroyed indigenous systems of checks and balances. This political rupture resulted in a process of estrangement between citizens and the state as well as the creation of a coercive apparatus of police and military forces to ensure compliance with colonial rules and regulations. Indeed, the authoritarian nature of the state can be seen as the hallmark of colonial rule. Economically, the West African markets, previously engaged in trade relations spanning the whole of the African continent, were transformed into export-oriented economies designed to satisfy the import needs of the respective European power.

In extreme cases, this meant that states were reduced to a monoculture status, producing one primary product. Cocoa production in the Gold Coast (Ghana) is an often-cited long-term effect of the economic policies of British colonialism.

Throughout the West African region, African political participation in government was marginal. Outside the four Senegalese principalities mentioned previously, Africans living in French-dominated states had no right of political association or freedom of speech until 1937. In the British colonies, the constitutional framework provided for the establishment of Legislative Councils in which membership was by appointment. In most cases, selected members of the African elite were nominated and sat with British officials. Nevertheless, in both Anglophone and Francophone countries, African political engagement remained an elite affair and did not pose a serious challenge to European domination until the 1920s.

In the decades following World War I, however, West African politics became characterized by rigorous struggles between African elites and their colonial governments about the degree of African involvement in governmental affairs. Mass protests against colonialism also occurred, such as the revolts against the implementation of the hut tax in Sierra Leone and Dahomey in the mid-1920s and resistance in Upper Volta against the arbitrary requisitioning of food and animals by the French. Among the individuals who dominated the African elite representation between the two world wars were Blaise Diagne (1872–1934) and his Senegalese Republican Socialist Party and Herbert Macaulay (1864–1946) and his Nigerian National Democratic Party. Like many other political leaders, they called for increased African political representation, electoral rights, and better educational facilities.

The growing scope of political consciousness in the interwar years was a result of many factors. First, World War I had required active African participation. Fighting on the battlefields made many Africans realize that there was a world beyond their villages and outside their lineage groups. Second, West Africa experienced a cultural awakening as a consequence of that participation. Africans who had studied abroad

had become influenced by European ideas, such as the right of self-determination and nationalism. Simultaneously, these European-educated Africans had also experienced European racism. Back home, this generation of African leaders began to promote the cultural and historical foundations of Europe. Some of the most famous works in this regard are associated with *négritude* or Pan-Africanism and the writings of individuals such as Léopold Senghor (1906–2001) and Léon-Gontran Damas (1912–1978). These were important contributions to proving false the notion of white superiority by which colonialism had justified its existence and in advocating the idea of a new, emancipated African self. Third, growing urbanization and a widely circulating African press saw the radicalization of political demands, including the Africanization of the civil service and a later call for independence.

The decline of Europe after World War II and, equally, Africa's important role in it as large-scale provider of troops during the war sounded the death knell of colonialism. If World War I resulted in the rise of African nationalism, World War II exacerbated its effect. However, for the West Africans the authoritarian legacy of colonial rule remained the region's most significant historical burden, especially as the environment of political and economic subjugation was carried over into the postwar era. After African independence—starting with Ghana in 1957—the authoritarian trend of colonial governance was replaced by the rise of undemocratic one-party states and military regimes.

Political Transformation in East Africa

Political transformation in East Africa during the period 1900–1945 can best be described as processes of local resistance to, and collaboration with, colonial rulers. When colonial powers arrived in East Africa in the latter half of the nineteenth century, they found a mix of African political systems in operation. Some peoples lived without subjugation to an external authority and without reliance on external exchange; these groups recognized an internal authority such as a chief and a hierarchy of elders. Colonists also encountered groups whose political structure and economies were based on a centralized government, and far from being self-contained, their economies were based on trade and were often predatory. These political systems were not kinship based, and their polities were distinguished by well-established formal bureaucracies that depended on revenues and exploitation of labor and slaves.

The imposition of colonial rule was aided by African leaders who aligned themselves with foreigners to strengthen their positions vis-à-vis a changing political climate. The British created British East Africa (the territory of what is now the independent countries of Tanzania, Uganda, and Kenya), and the Germans created German East Africa (modern-day Tanganyika, Rwanda, and Burundi).

African political transformation came primarily under the guise of religion, namely Christianity. In order to gain ascendancy within the colonial structure, many Africans became Christianized, as Christianity provided a pathway to salvation and political and social survival under colonial rule. This strategy was successful for Africans because neither the Germans nor the British wanted to invest heavily in the administration of the colonies, therefore relying heavily on chartered companies and very small colonial administrative forces. As such, Africans who allied with the colonial powers were left to govern themselves. For example, at the turn of the twentieth century in present-day Uganda, the Ganda people became Christianized. Armed with Christianity and aligned with Britain, the colonial-appointed chiefs were able to usurp

► ROLE OF INDEPENDENT CHURCHES

East African Independent Churches instigated and mediated political transformation not solely out of opposition to missionary churches. Radical criticism of colonialism and mistrust of European religion also fueled the movement of Africans to establish their own forms of Christianity. Africans initiated Independent Churches for religious, political, and social reasons. These churches were places where existing African cultural practices and Christian doctrines met and mutually transformed. The constitution and testament principles of the African National Church, introduced in Tanzania in 1930, demonstrated the confluence of African faith, Christian doctrine, and political change.

—Lorna Lueker Zukas

power from the traditional ruler, Mwanga, who opposed British encroachment.

Britain was able to utilize an African administrative structure, reducing its expenses for control of the area. With British support, Buganda chiefs attacked neighboring peoples and imposed Buganda political structures and colonial control throughout the region. The allied kingdoms under British control were left to govern themselves with a minimum of interference. However, not all peoples inhabiting the region welcomed the British and often employed forms of passive resistance, such as the use of vernacular languages and the refusal to accept the authority of neighboring or colonial appointed alien chiefs. Outright attacks on colonial officials were also carried out at times.

The situation was similar in Kenya, as African political transformation was shaped by resistance and collaboration to colonialism. The Masai, decimated by disease, group infighting, and Rinderpest infestation of their herds, joined forces with the British against their neighbors, the Kamba and Kikuyu, who resisted British rule. The Masai, like the Ganda, gained political power by oppressing other peoples. In addition, the British also used a policy of divide and conquer by empowering subgroups within a group to challenge an uncooperative existing political structure. Individuals locked out of traditional

power structures, by birth or as a factor of age, were able to gain power by siding with the colonial power. Legitimate African leaders who resisted colonial occupation were often killed or sent into exile. The colonial-designated chiefs were simply figureheads with little initiative in directing the business of their areas. Their primary functions were to aid in communication, maintain order, collect taxes, and designate men to work for European settlers.

While some educated Christian elites served the colonial master, there were many who opposed colonialism and led resistance efforts. Designated chiefs could not control people who were upset with land expropriations, forced labor at inadequate wages, or the migratory labor systems that took men away from their families. These unredressed issues, generalized oppression, and the desire for fair treatment, freedom, and a political voice led to African resistance movements and rebellions.

In German East Africa (GEA) the colonial master differed only in the higher level of violence used against Africans. The Germans also used the local people in the administrative structures of the areas. Greater violence against Africans led to more fierce forms of resistance in GEA as Africans attempted to assert their autonomy and independence. The fiercest resistance came in 1905 with the Maji Maji Rebellion. Struggling against forced cotton-growing schemes that produced more hardship than profit for African workers and with no other way to protest, the people of the Matumbi Hills attacked the GEA colonial headquarters. The Maji Maji Rebellion represented a moment of political transformation as a mass movement of protest rather than just local rebellion by individual ethnic or tribal groups. The rebellion failed in 1907; however, the lessons of mass action were used by later political leaders.

After the Maji Maji Rebellion, the Germans changed their colonial policies to end the worst of the abuses, and many Africans transformed their resistance into acceptance, gained European educations and skills, and used these to better their position within the colonial society. After 1914 the members of this newly educated African cohort established themselves as the most effective communicators between Europe-

ans and Africans, thus usurping political power away from official chiefs.

Despite Christianity and the growing number of educated Africans working within the colonial system, Africans were acted upon and not consulted by the colonial rulers. Authoritarian colonial political systems encountered African resistance. After World War I, African political transformation was channeled into educational, religious, and ethnic groups. Most political activity was local in nature and contained within a locality and an ethnic group. These local political protests sought not to overthrow colonialism but rather only to improve quality of life and working conditions. However, during this period the formation of indigenous African political organizations became an important part of the ongoing political transformation.

Throughout East Africa, political associations sprang up to demand equal access to education, land, and the ability to grow cash crops where colonial policy prohibited the peasantry from doing so. The formation of improvement societies and African associations helped Africans to organize and improve local communities. However, by the end of the 1930s Africans found that their improvement societies brought them into conflict with the colonial government. For example, when the Kikuyu Central Association began to make preparations for a campaign of civil disobedience involving all of the Kikuyu in order to protest the land issue, the association was banned. However, within a few short years organizations such as this would lead the way to African independence; African resistance to colonial policies and practices ultimately transformed the colonial landscape.

Colonial rule was imposed in Africa without consent from most African people. Some African leaders collaborated with European colonizers to gain power for themselves and their people, while others offered fierce resistance to foreign rule. Africans did not accept being governed without any representation and often struggled to transform the political landscape. Primarily educated and Christian Africans, who maintained that all men were equal, opposed the colonial policies that restricted economic opportunities and limited participation in the political process. Four key means were used to achieve political transformation in

East Africa: (1) the formation of African organizations to promote African economic interests and to end discriminatory policies and increase opportunities, (2) religious opposition and the formation of African Independent Churches, (3) attempts by labor unions to organize workers, and (4) the use of mass protest and consumer boycotts gave rise to an African voice in the transformation of East Africa.

Political Transformation in North Africa

The following discussion will focus on the dramatic transformation of the political structures of northern Africa that occurred as a consequence of the brief period of European colonial domination of the region. During the first half of the twentieth century, Britain, France, and to a lesser extent Italy replaced the Ottoman empire as the dominant powers in northern Africa, ending five centuries of Islamic rule. European expansion and the north African struggle against European colonialism in the first half of the twentieth century are the principal themes to be explored in this article.

As the twentieth century commenced, the British were seeking to extend their control over the territory transversed by the Nile in order to secure their position in Egypt, which was central to their strategic interests in the region. Control of Egypt ultimately led to the control of the Suez Canal, thereby controlling a passageway to Asia, especially to India, the most important British colony. In 1899 combined British and Egyptian forces invaded Sudan and defeated Sudanese forces at the Battle of Omdurman. Sudan was

► IMPLICATIONS OF THE DEMISE OF THE OTTOMAN EMPIRE

The Ottoman sultan's decision to sign the Treaty of Sevres in 1920 was the catalyst for the overthrow of the sultanate and the creation of the modern State of Turkey. With the end of the sultanate, hopes across North Africa that Ottoman revival would lead to the defeat of the European invaders and a return to the precolonial unification of the Arab lands were dashed. The Ottomans had provided the political, economic, and cultural environment for North African and Arab societies for four centuries. The end of the Ottoman sultanate sent shockwaves throughout the region. Without the traditions of the past glory of the Ottomans, North African resistance to the occupiers required a transformed political framework. The void left by the demise of the Ottomans would be filled by the competing ideologies of liberal nationalism, Pan-Arabism, and political Islam. During the ensuing decades the political aspirations of North Africans would alternate between these three dominant political ideologies. Nationalism would influence the first-generation leaders as they fought for independence from colonialism. Over time, both Pan-Arabism and political Islam would prove influential in shaping the politics of North Africa.

conquered by the British primarily to prevent French control of the region that might threaten the all-important water route to India. However, French pride would be soothed by British support for the extension of French control elsewhere in northern Africa, in particular in the strategically important Kingdom of Morocco.

Although Morocco was still an independent kingdom at the turn of the century, it had been weakened by Spanish penetration from the 1860s onward. In a bid to counter further European expansion into his domains, Sultan Hasan (1873–1894) embarked on a costly program of modernizing the army and the government administration mainly by borrowing from European banks. When the sultan was unable to meet the repayments, British and French financiers had the sultan at their mercy, and in 1904 the Spanish and the British agreed to allow the

French to establish paramount influence in Morocco. In 1907 the Spanish and French officially occupied the Kingdom of Morocco, and the sultan acquiesced to the occupation, which led to internal rebellion. Five years later the kingdom became a French protectorate, with the important trading port of Tangier governed by a special international agreement.

The other region of northern Africa that was still independent of European control at the turn of the twentieth century was the Ottoman province of Libya.

In 1911 the Italians invaded the area by declaring war on the Ottoman empire, upon which they occupied the coastline and the capital city, Tripoli. The Ottoman rulers accepted Italian administration over Libya at the peace settlement that ended the Italo-Turkish War (1911–1912). As a result of these various actions, by the outbreak of World War I all of northern Africa was under European control.

In Egypt, British colonialism brought about dramatic changes to land ownership, and as a result a large landless class was created, with 40 percent of cultivable land being owned by absentee landlords in large estates of more than 50 *feddans* ($\pm$ 52 acres or 21 hectares). The wealth exhibited by the foreign population of colonial administrators, merchants, and investors was in stark contrast to the increasing levels of poverty to be found across the country. As a result, a dual society was formed in which Westernized Egyptians and foreigners mingled in the newly constructed fashionable areas of Cairo and Alexandria, while the majority of the population struggled to find employment on the estates of the rich. By 1914 opposition to British rule was endemic among the Egyptian populace.

The changes that had occurred in French northern Africa were equally dramatic. By 1914 the situation in Tunisia had come to resemble Algeria, which was the first European colony in northern Africa (with European settlements from the 1830s). The influx of European settlers into Tunisia unsettled the existing social structures and led to increasing resentment of the colons (the European settlers) by the indigenous population. Land reappropriation and generous capital advances to immigrants from France led to the formation of a significant settler population. The

colons demanded political power over both protectorates, and by the time of the outbreak of World War I, both Algeria and Tunisia were controlled by French settlers who regarded the indigenous population as a threat and resented any attempt by the metropolitan government in Paris to intervene on behalf of the Muslims.

Although both Great Britain and France seemed to be at the apogee of power in 1918, with control of vast empires that stretched across the world, the reality was that four years of death and destruction had taken their toll. As a consequence, western Europe's hold on empire was more tentative than ever. At the same time, the north Africans had come to realize the hollowness of the European promises of "civilizing the natives." From all over the colonial expanse, the colonized asked the question of how the authors of the four years of carnage in Europe could claim any moral superiority over them.

British and French wartime vilification of the Habsburg and Ottoman empires revolved around dismantling "oppressive" regimes that repressed the right to self-determination. The hypocrisy of such claims, if not apparent to the colonizers, was certainly evident to the colonized. The contradictions were most apparent to the Algerians and Tunisians on their return home from the

war, during which time they had fought for French liberty. The Egyptians also paid a high price for supporting the British war effort, with higher taxes, rationing of goods, salary reductions, and forced retrenchments. When no reward for the sacrifices by north Africans for the war effort was forthcoming, agitation ensued, thus increasing the discontent.

The most well-developed movement for self-rule was to be found in Egypt. On receipt of the news that the British had disallowed an Egyptian delegation to Versailles in 1919 to put forward its case for self-determination, widespread opposition to British rule broke out. Though the insurrection was put down, it was apparent that the era of British political domination over Egypt was drawing to an end. On February 28, 1922, independence was declared. Even with independence, however, the British maintained control over vital areas of Egyptian domestic and foreign policy, which would be further abrogated in 1936. Elections were held in 1924, with the anti-British Al-wafd Al-misri Party receiving widespread support and winning 179 out of the 211 parliamentary seats.

Over the following decade, the growth in the potency of Egyptian nationalism and British fears of further radicalization of the movement

if concessions were not forthcoming led to a compromise agreement in 1936. It was announced that the British military occupation of Egypt would come to an end and that British control over foreign and domestic policies would conclude. However, the British would be able to maintain troops in a zone immediately surrounding the Suez Canal. The following year, Egypt was admitted to the League of Nations as the first independent state from northern Africa.

Northern Africa would be the scene of major battles of World War II, leading to Italian defeat that ensured Libya's emancipation from Italian colonial rule. Despite the erosion of French power, the French north African colonies faced years of agitation and war before independence finally became a reality. However, the force of national liberation movements in Algeria, Tunisia, and Morocco could not be ignored by the French, and it would not be long before upheaval and war would bring independence to northern Africa.

Political Transformation in China

During the first half of the twentieth century, China experienced a series of dramatic and at times bewildering political shifts from an imperial dynasty to a communist state. Chinese leaders experimented with Western-style republican government, military dictatorship, and nationalist revolution to achieve a national revival. From the decline of the imperial system, it would take

nearly four decades for the Chinese Communist Party under Mao Zedong to organize and implement a lasting political and ideological framework to restore stability and unity in China.

From 1901 to 1911 the Manchu-ruled Qing dynasty undertook a series of reforms to stave off dynastic collapse in the face of Western imperialism and social disintegration. These superficial reforms were designed to retain Manchu rule rather than modernize the empire. Education reforms, such as abolishing the civil service exams in 1905, undermined the means of inculcating an orthodox state and social ideology that had linked Chinese scholar-elites to the state. The Qing dynasty severed its role of legitimating elite status and alienated an important element of Chinese society, while other Chinese reformers demanded transition to a constitutional monarchy.

The alienation of the Chinese scholar-elites and growing demands for constitutionalism led to a growing anti-Manchu sentiment. Uprisings broke out in Central China that were inspired by Dr. Sun Yatsen and his *Three Principles of the People* (*Sanmin Zhuyi*): nationalism, democracy, and people's livelihood. By November 1911, 15 provinces had successfully seceded from the Manchu Empire. The 1911 revolution, known as the Xinhai Revolution, swept away ancient imperial institutions and state ideologies; however, no ready-made political or ideological systems existed with a common consensus capable of restoring stability and unity to China.

The presidency of the fledgling Republic of China was placed in the hands of General Yuan Shikai. Even though Yuan had initially supported the Qing dynasty, he was viewed as the only person who could hold the nation together at this crucial time. As president during 1912–1916, he relied on political assassination, threats, and corruption to achieve political ends. Instead of governing through the civilian officials and bureaucratic institutions, Yuan ruled through the Beiyang Army, which was personally loyal to him.

In late 1915 Yuan abandoned the idea of a republic and proposed the restoration of the monarchy. He believed that a monarchy was a more effective, durable, and appropriate form of government for China, as the republican attempts had failed to engage the average Chinese citizen, who remained aloof from the political process.

Yuan's attempt to name himself emperor ignited the successful Anti-Monarchical Movement, which forced Yuan to cancel his plans. In the end, however, the Western-style republican government had failed to provide an alternative to imperial rule and to unify the nation.

With Yuan's death in 1916, no single recognized authority existed with the ability to prevent national disintegration. The result of this political vacuum was the rise of regional warlords. The warlord era emerged when civilian authorities increasingly called upon local military officers to solve political issues. Regional and provincial militarists gradually replaced civilian authorities as political leaders. The warlord era also witnessed the fracturing of China into regional and provincial units governed by these militarists that reflected a long-present regional differentiation in China. Although a national government existed in Beijing and was recognized by the foreign powers as the legitimate government of China, it was no more than the pawn of the militarist who temporarily controlled the capital.

Conflict between individual warlords and warlord factions devastated China between 1916 and 1928. The militarists shifted their support and remade alliances at a dizzying pace, and hopes of national revival under a single military leader led to greater political fragmentation. Resources were squandered in endless conflicts, and militarist intervention in politics denigrated the whole political process and political frameworks.

Warlord rule, bereft of appealing political ideals, continued until another force challenged it both militarily and ideologically.

In 1924 the alliance between the Nationalist Party (Guomindang) and the Chinese Communist Party (Gongchangdang) presented just such an alternative. Initiated by Dr. Sun Yatsen, this alliance paved the way for a military campaign, the Northern Expedition, to destroy the warlords, check foreign intervention, and unify the country. The Nationalist-Communist Alliance stood poised to establish a new order in China. However, the conflicting ideologies of the two parties were too great to maintain the successful coalition. In April 1927 Generalissimo Jiang Jieshi, commander of the National Revolutionary Army and leader of the Nationalist Party's right wing, violently purged communists from

➤ WORK-STUDY MOVEMENT

During the early twentieth century, wealthy Chinese families began to send their sons abroad for an education. Paris, considered by many to be the cultural and intellectual center of the world, was the most popular destination for the Chinese students. The overarching purpose of the work-study program was to expose the students to Western ideals and to better equip them to strengthen and reform China upon their return. However, the effects of these programs were far greater than anyone could have predicted. The students became entrenched in Western ideologies, most notably Marxism and anarchism, through not only intellectual pursuits but also hard factory labor as well. They actively participated in labor movements and anti-imperialism demonstrations, developed numerous left-wing societies, and had direct contact with some of the greatest intellectuals in Europe. When the students returned to China, they profoundly altered the traditional political arena. Many became proponents of various Leftist movements, while others, including Deng Xiaoping, became high-ranking members of the Chinese Communist Party.

the party and massacred communist supporters in Shanghai, leaving the Nationalist Party dominant.

During the Nanjing Decade (1927-1937), the Nationalist government spoke of nationalist revolution. Rather than a class-based Marxist revolution or a Western-inspired political ideology, the Nationalists depicted warlords and imperialists as weakening China. Yet the Nationalists allowed many former warlords to accept positions in the government during the 1926-1927 Northern Expedition. The Nationalist government's authority only extended to eastern and central provinces, with many peripheral provinces retaining local autonomy. All in all, the administration remained corrupt and inefficient. It continued to rely upon the urban and elite elements of society for support, and it failed to address the real problems of the rural masses. Although the Nationalists espoused Dr. Sun's beliefs about democracy, the government failed to adequately deal with the growing pressure of political participation.

During the Sino-Japanese War (1937–1945) the vigors of the Nationalist regime eroded. A second Nationalist-Communist Alliance during the war was suffused with tension and failed to maintain a genuine concerted effort. The Communists, under Mao Zedong, used the war period to regroup and reorganize. After the war the Chinese Civil War began, pitting the Communists against the Nationalists. The Chinese Communist Party defeated the Nationalist regime in 1949 through its exceptional organizational skills, effective leadership, popular discontent with Nationalist corruption, inefficiency, and arrogance during and after the war and finally through successful peasant mobilization. Under Mao, the Communists effectively harnessed the strength, energy, and support of the rural masses by offering a coherent ideology and political framework for restoring stability and unity to China.

Political Transformation in Japan

The period from 1900 to 1945 in Japan witnessed the development of popular political parties and their deterioration and removal by authoritarian rule. The emergence of popular political parties ended the domination of the Meiji oligarchs and offered the potential for new forms of stable democratic government within

the framework of the Meiji Constitution. Growing tension in the 1930s between civilian politicians and military leaders over international and domestic policy prompted independent actions by the military that led to their eventual domination of the Japanese government.

After a decade of contentious parliamentary politics between popular political parties and the Meiji oligarchs who had led the Meiji Restoration in 1868 and modernized Japan, there was a profound shift toward mutual accommodation. In 1900 Ito Hirobumi, one of the last of the oligarchs, became president of a parliamentary party, Seiyukai (Friends of Constitutional Government Party), led by Hara Kei. An astute politician, Hara Kei used this newfound alliance with the oligarchs and bureaucracy to enhance and extend the power of Seiyukai.

By making concessions and providing critical support to the government in the early 1900s, Hara Kei enabled Seiyukai to be the dominant party in Japanese parliamentary politics. During the Russo-Japanese War, Seiyukai support for the budget was critical. In exchange for party support, Hara was appointed home minister and used his position to build local-level support through patronage and directing government funds to loyal supporters. Seiyukai's growing success and influence compelled other parties to find powerful patrons.

In 1913 Katsura Taro, another leading oligarch, formed another political party to resist Seiyukai dominance. Known by many names during its lifetime, this anti-Seiyukai party successfully challenged Seiyukai dominance and established the pattern of a two-party political system in prewar Japan. Seiyukai won the 1917 election, and Hara Kei was chosen as prime minister, setting the precedent for the prime minister to be drawn from the dominant political party. Political parties thus established a stable democratic parliamentary system by working within the structure of the Meiji Constitution.

The two-party political system dominated Japanese politics between 1918 and 1932. Although there were three transcendental or non-party cabinets between 1922 and 1924, the Seiyukai and anti-Seiyukai party (established as Doshikai in 1913, Kenseikai in 1916, and Min-

seito in 1927) cabinets retained the dominant position over the military and bureaucracy in Japanese politics. The Meiji bureaucratic leadership, which had been so influential before 1900, was unable to perpetuate a new generation. The military, internally factionalized, had yet to present itself as a direct challenger to parliamentary government.

This situation changed in the 1930s due to a variety of domestic and international issues. Factions within the military became increasingly concerned about intensifying social unrest, the growing Chinese nationalism that threatened expansionist designs in Manchuria, and the international cooperation and disarmament policies of Prime Minister Hamaguchi Osachi's cabinet. In particular, the military was dissatisfied with Foreign Minister Shidehara Kijuro's conciliatory policy toward the West, as evidenced by the London Naval Treaty of 1930. Leading naval officers accused Shidehara of capitulating to British and American efforts to keep Japan as a second-rate power when he comprised on warship ratios. The treaty required imperial approval, and the emperor looked to naval advisers before approving the treaty. The government manufactured a majority of support within the Supreme War Council for approving the treaty, but a leading admiral demanded an audience with the emperor based upon the right of supreme command.

The controversy between the military and the civilian government thus focused on the right of supreme command. This right, included in the Meiji Constitution, gave the military the right to advise the emperor on military policy. The question emerged as to whether the civilian cabinet or the military had the right to determine defense policy. Hamaguchi's cabinet won imperial approval and gained ratification of the treaty, thereby protecting the prerogative of the civilian cabinet over the military on defense policy. Yet the process weakened civilian rule and led to further challenges by the military against popular party politics.

The Manchurian Incident of 1931 once again brought the compromising attitude of the civilian government into conflict with the military factions who sought to secure Japanese control over resource-rich Manchuria. The general staff and

midlevel officers who staged the incident fervently believed that Manchuria's resources were a prerequisite for Japan's defense against the Soviet Union or the United States. The incident, a small explosion along the Japanese-owned railway tracks blamed on Chinese soldiers, paved the way for the Japanese takeover of Manchuria and won popular support for the military, which acted with complete disregard of the civilian cabinet's wishes.

The assassination of Prime Minister Inukai Tsuyoshi in 1932 signaled another shift in political dominance. The political parties' influence declined sharply, to be eclipsed by a resurgent bureaucracy and military that dominated the political landscape like the parties had done since 1918. However, the military and bureaucracy never fully consolidated power in a monolithic authoritarian system similar to German or Italian fascism. The military remained factionalized and competed for control over the direction of Japan's future. Uprisings, political assassinations, and coups led by right-wing ultranationalists and military officers between 1932 and 1936 failed to alter the political structure but succeeded in further undermining civilian rule and enhancing military influence.

Subsequent short-lived cabinets, which were run by military men or by civilians such as Prince Konoe Fumimaro, were strongly influenced by the military. The military's vision of domestic and international policies, characterized by Japan's need for strategic resources drawn from the Asian mainland in order to prepare for a future war with the Soviet Union or the United States, dominated policy making in the 1930s and 1940s up to World War II.

Political Transformation in South Asia

The early twentieth century was a time of social change and upheaval for southern Asia. The Indian subcontinent had been under British rule in one form or another for over a century, and agitation toward the Raj (British rule) increased with the rising national and racial aspirations of the natives. Much of the cause for this change in attitude toward the British rule was due to political and educational processes brought to southern Asia by the British themselves.

During the preceding century, the Indian National Congress (INC), formed in 1885, began pushing for more influence in the Indian Civil Service. Members of the congress succeeded as candidates elected to the Legislative Councils, the legislative bodies of the various principalities, in the late nineteenth century, but their influence was minimal in the early part of the twentieth century. A series of governmental bungles responding to bubonic plague outbreaks, accompanying famine, and a later earthquake caused further dissension in the native population. The creation of new provinces out of the populous Bengal province was seen as an attack on the Hindu majority in this area and prompted protests and a boycott of British goods. The move cut into imports by more than 25 percent within the space of a few years and was a stimulus to Indian industry and national aspirations. The British response was to attack the boycott and Hindu antiparition (of Bengal) movements with criminal prosecutions and military force. This simply spurred more radical elements of the Indian National Congress to split into the New Party in 1906. In reaction to this Hindu power bloc, the Muslims of eastern Bengal and Assam began to form moderate political parties loyal to the Raj and based around their Islamic religion.

These more religiously based movements advocated violence and, sensing weakness in their foreign rulers, turned to the bomb to gain their freedom. More crackdowns by the government followed in an inevitable cycle of rebellion and repression. Despite this trend, 1909 saw the election of an Indian to the Executive

Council, the body that instituted legislation crafted by the Legislative Council and advised the governor of the colony. The seat would be retained by a “native,” and more seats in the central Legislative Council for Indians were created in 1910, with the ability to “question and debate” legislation and budgetary issues. This newly empowered Hindu-strong influence in Indian government alienated the Muslim League, moving it toward radicalism. Hindu influence also fomented resistance in Burma, where the Young Men’s Buddhist Association began to agitate against Indian involvement in Burmese affairs.

Initial Indian reaction to World War I was surprising to many in London. The Indian nationalists and the native princes showed amazing loyalty to the Raj and Britain, sending troops to Europe to aid in the fight. The casualty numbers were staggering, and the shortages caused by the war soon turned Indian public opinion against conflict. To stabilize the empire, the India Office, the English bureaucracy overseeing the governance of the colony, tried to push through more constitutional and nativist policies, but opposition among the white bureaucracy in Calcutta was too entrenched to allow it. The result was that the Indians felt a deep sense of insult at the lack of gratitude Britain showed for their sacrifice. The INC abandoned cooperation with the colonial government in 1920. Lawyer and Indian independence activist Mohandas K. Ghandi returned to India to launch small-scale experiments in self-rule and promoted a crusade of nonviolent resistance to British rule.

As Ghandi’s supporters sought to paralyze the machines of British industry in India, Muhammed Jinnah, leader of the All India Muslim League, led the native officials in doing the same to the instruments of governance. Police action against these nonviolent protests lost Britain the moral luster of its colonial mission, leading to the 1935 Government of India Act, which introduced direct elections and expanded franchise; in 1937, provincial autonomy was provided to India. The elections of 1937 resulted in a government that was heavily skewed in favor of Hindu politicians and led Jinnah and the Muslim League

to realize that their political aspirations were not to be realized in the framework of a united India. World War II and the congress's support of the British gave Jinnah the pretext needed to accelerate his plans to create a separate Muslim state. This set the stage for the Partition of India and the creation of the independent nations of India and Pakistan in 1947.

While often connected in the colonial mind with India, Ceylon (the island now known as Sri Lanka) was a separate colony created in 1802. The island was primarily a haven for plantations producing rubber, indigo, tea, sugar, and other products. Throughout the early part of the twentieth century Youth Leagues mirrored the actions of the civil rights movements on the subcontinent. The island was one of the main bases for operations against the Japanese in World War II. In 1948 the colony was granted independence by Great Britain.

Nepal had changed little throughout the nineteenth century. The shah kings of Nepal had lost much of their territory to the Indian colonial government, and the country entered a period of self-imposed isolation, broken only by tribute payment to the Chinese emperor every five years. Even these payments ended in 1912. Except for the British resident to the court and the occasional explorer, Nepal was untouched by the outside world. This changed with World War II. The effects of the fighting in China and Tibet pushed refugees into Nepal, bringing new political ideas along with population pressures. The independence of India and the radical politics of the INC directly influenced the creation of the Nepali Congress Party in 1946 and the first constitutional government in 1948.

Political Transformation in Southeast Asia

Although Southeast Asia's societies evolved differently under the often very restrictive, racist, and authoritarian political frameworks imposed by the Western colonial powers, they nevertheless underwent significant political transformation during the period from 1900 to 1945. During these years the gradual, but often substantial, process of political change was further galvanized by the Japanese occupation during the early 1940s. Yet how these transformations played out locally depended upon a number of geopolitical factors, such as the interplay between foreign powers and the local society against the backdrop of rapid social change, notably rapid demographic growth, urbanization, cultural transformation, and technological innovation.

Alone among the Southeast Asian mainland polities, Burma, conquered by the British in three stages (1823–1826, 1852–1853, and 1885) had its monarchy abolished. From 1886 to 1937 Lower Burma, a part of British India with its predominantly ethnic Burman population, was governed directly; Upper Burma and its many hill tribes were ruled indirectly. Initially Buddhism and from the 1930s mainly various Western political ideologies (spanning the political spectrum) became vehicles of Burman political aspiration. Due to the British preference for Indians and ethnic minorities in the administration, police, and military, the reassertion of Burman ethnicity became a key rallying point. While the Hsaya San (Saya San) Rebellion (1930–1932) had at least shown the potential of violent collective action, politics remained heavily fractured between various leaders. The Japanese defeat of the British and their support of the Burma Independence Army opened the door toward independence but at the same time unleashed destructive forces that would lead to decades of civil strife and the eventual assertion of the army as the key state-building institution.

The kingdom of Siam's diplomacy and relative openness toward Western ideas and trade as well as its buffer position between the British and the French allowed it to preserve its independence, though at the price of painful territorial losses

COLONIAL ELITES AND POSTWAR INDEPENDENCE IN SOUTHEAST ASIA

While often coming from privileged backgrounds in terms of access to education, Southeast Asia's newly emerging modern elites often were Western-trained and well traveled. These individuals had to negotiate the contradiction of colonial ideals and repression, balance the weight of tradition with the uncertainties of the future, and explore new ideas, means of communication, and forms of organization in order to mobilize collective action. Among this group were Burma's General Aung San (1915–1947), Thailand's Field Marshal Phibun Songkhram (1897–1964), Vietnam's Ho Chi Minh (1890–1969), and Indonesia's Ahmed Sukarno (1901–1970). Ho and Sukarno were the most charismatic, radical, and successful of this new group of political entrepreneurs. Ho, the classically and Moscow-trained son of a middle-ranking scholar-official, was the founder of the Vietnamese communist movement and first president of the Democratic Republic of Vietnam. In the Netherlands East Indies, the mercurial Dutch-trained civil engineer Sukarno, son of an aristocratic Javanese primary schoolteacher and a Balinese mother, was a founding member of the Indonesian Nationalist Party and was also the Republic of Indonesia's first president.

—*Tobias Rettig*

and significant administrative modernization. In 1932 reformers in the bureaucracy and the armed forces led a coup that ended the absolute monarchy. Seven years later the ultranationalist and pro-Japanese government of Prime Minister Plaek Pibulsonggram (aka Phibun Songkhram) (1938–1944) gave Thailand its present name. A pattern of usually short-lived civilian governments and coups and sometimes longer-lived military dictatorships continued well into the post-1945 era, with national politics remaining the preserve of the military and the bureaucracy until the early 1970s.

Vietnam was conquered by the French in stages between 1859 and 1884 and was divided into the colony of Cochinchina and the protectorates of Annam and Tonkin. In 1887, together with Cambodia (Laos was added in 1893), they would be formed into the Indochinese Union.

Unlike Cambodia and Laos, where identification with Buddhism and royalty remained strong until well after 1945, Vietnamese nationalists explored new ideas and modes of organization when they realized that the French had politically emasculated the Vietnamese emperors. Communism and the Guomindang provided particularly attractive models from the late 1920s on, but communist and nationalist uprisings were heavily repressed in the early 1930s. The Japanese elimination of the French colonial administration in March 1945 and Japan's wartime defeat five months later created a political vacuum. Capitalizing on the events in play, Ho Chi Minh and the broad-front Viet Minh declared Vietnam independent under the new name of the Democratic Republic of Vietnam (DRV).

In British Malaya—the lightly populated Malay Peninsula—the British had extended piecemeal control from 1786 and established different forms of governance for its three colonies: the Straits Settlements (which had gained Crown colony status in 1867), the Federated Malay States (which provided central administration to five Malay sultanates from 1895), and the Unfederated Malay States (which was formed in 1909 with no central institutions). As the twentieth century progressed, a new Malay political consciousness gradually emerged, one that was separate from the more localized allegiances to the sultans. It became more pronounced in the 1930s, as Chinese and Indian immigration threatened Malay demographic superiority and when the Chinese-dominated Malayan Communist Party challenged the existing power structure. Even the Japanese invasion and occupation during World War II did not transform into violent Malay anticolonial mass mobilization but instead transformed into the soliciting of British protection. Following the war, Malay elites claimed political hegemony and negotiated independence with other ethnic groups as junior partners.

While parts of the Netherlands East Indies had been under Dutch control for more than three centuries, accelerated Dutch campaigns from the 1850s were mostly completed by 1900. To overcome the sprawling archipelago's regional, ethnic, and historical differences, early-twentieth-century nationalists attempted to mobilize by means of religion (Islam) and ideology (commu-

nism). Eventually a secular nationalism using Indonesian (a form of Malay) as its lingua franca proved most successful. The Japanese interregnum, when Japanese-led military and paramilitary units were created and nationalist leaders were given free rein to mobilize, set the country on a four-year independence war against the returning Dutch. The Indonesian armed forces would reveal themselves as the key state-building institution, outlasting the initial period of multiparty democracy, rebellions against the central government, and President Sukarno's Guided Democracy.

Colonized during the reign of Spanish king Philip II (r. 1556–1598), the United States intervened in the Philippines during the Spanish-American War of 1898. After the harsh suppression of the Philippine Revolution (1896–1902), the Americans rapidly implanted democratic institutions and elections but failed to launch significant land reform. The 1934 promise of independence by 1946 went ahead despite more than three years of Japanese occupation. The American failure to address important social inequalities led to the capturing of state institutions by a well-connected though rivaling oligarchy of families who continue to dominate national politics to this day.

Political Transformation in Oceania

From 1900 to 1945, vast political changes occurred in the geographic area commonly referred to as Oceania, which includes Australia, New Zealand, and numerous islands in the Pacific. Some transformations resulted from a de-

sire on the part of the inhabitants for sovereignty, some were administrative changes, and others were the result of world wars. All, however, took place amid dynamic world events in which the area of the South Pacific became more tied to global politics.

In 1900 the British parliament ratified a separate constitution for Australia, and the six preexisting colonies consolidated as one federal state in 1901. Although the new Commonwealth had its own parliament and prime minister, the British monarch continued as head of state. The government established its transitional headquarters in Melbourne while the permanent capital at Canberra was built. Several adaptations in the structure and membership of Australian political parties transpired, but World War I caused even more dramatic adjustments. In August 1914 Australia entered the war and supported the Allied Powers. Australian Labor Party leader William M. Hughes was elected prime minister in 1915 and advocated conscription, but disputes over that practice divided the Labor Party, while Australia sent thousands to fight for Britain during the war.

At war's end, the 1919 Paris Peace Conference divided German-held lands in the Pacific among the Allied Powers. German New Guinea came under Australian authority, and the Commonwealth also shared administrative responsibilities for Nauru with New Zealand and the United Kingdom. Disagreements over national economic measures to alleviate poverty during the Great Depression caused the Labour Party to fracture further, allowing the conservatives in the United Australia Party led by Joseph Lyons to

John Curtin, Australian prime minister during World War II, made Australian defense his main war objective by withdrawing troops from British command and creating a closer relationship with the United States. (Library of Congress)

➤ AUSTRALIA AND NEW ZEALAND ARMY CORPS (ANZAC)

Acknowledging their past imperial ties and role as British dominions, both Australia and New Zealand provided military personnel to support Great Britain during World War I. These combined forces, known as the Australian and New Zealand Army Corps (ANZAC), were first deployed to Egypt and Turkey. Members of ANZAC are commemorated for their resolve during the unsuccessful campaign on the Turkish peninsula of Gallipoli in 1915 that was intended to eliminate the Ottoman empire as a German ally. The episode, however, created a rift between ANZAC and the British Military Command when ANZAC troops began to see themselves as mere cannon fodder for the benefit of British advances. As a consequence, a sense of Australian and New Zealand nationalism began to emerge. After withdrawal from Gallipoli ANZAC was reorganized, with some units being sent to the western front while others remained in the Middle East. ANZAC Day is acknowledged yearly in Australia and New Zealand on April 25 as a day of memorial as well as national celebration.

—Brenda Jeanne Murray

dominate for several years. Australia again followed Britain to war with Germany in 1939. The Australian Labor Party regained power, and its leader John Curtin became the new prime minister of the Commonwealth, serving until his death in 1945.

New Zealand experienced similar political developments. It had declined to become part of Australia in 1901 and became a separate British Overseas Dominion in 1907. But like Australia, New Zealand remained tied through previous association to the United Kingdom and joined Australia with a combined military force known as ANZAC to support the Allies in World War I. After the war, New Zealand gained authority over German Western Samoa and shared the mandate for Nauru with Australia.

Economic distress during the Great Depression caused riots in New Zealand. The govern-

ment, led by Labour Party leader Michael Savage, took control of many financial ventures, imposed rationing, and instituted conscription after a 1939 joint defense conference with Australia and the United Kingdom. By 1942 Nationalist Party members dissented amid political disaffection. Even so, the administration continued nationalizing private organizations, including banks.

Pacific Island groups experienced different types of political transformation. New Guinea, Samoa, and the Solomon Islands had been German territories, but Australia and New Zealand took control of them after World War I. The Micronesian and Marshall islands had similarly become Japanese Mandates after World War I but then later became occupied by the United States during World War II. Others, including the Solomons and Papua New Guinea, became fierce battlegrounds between the Japanese and Allied forces, occupied intermittently by one and then another throughout the conflict.

Increased autonomy gained at the turn of the twentieth century led to a rise in nationalist sentiment in Australia and New Zealand through political participation by their citizens even though they acted upon ties of heritage to Britain. However, a continuous change in governmental administration throughout the first half of the twentieth century in the islands translated into a protracted undefined allegiance. In both the new sovereign states and the administered islands political transformation in Oceania from 1900 to 1945 stemmed largely from outside forces.

■ Introduction: Political Transformation in Europe and the Americas

Whereas the main political division in the nineteenth century was between conservatives and liberals, in the twentieth century the main political division was between classical laissez-faire capitalists and their many opponents. This is a truism that both describes and obscures the political reality of the period. As every truism, it also exceedingly simplifies the political divisions. Politics during the years of the emerging mass media was also characterized by an alarming gap between political rhetoric and political reality. The emergence of various totalitarian political movements, including Nazism and fascism in Europe, Stalinism in Eurasia, and Caudillism in Spain and Latin America, further complicates an analysis. Thus, one finds political parties that are socialist on economic issues yet traditional on cultural issues. This reality is exemplified by Josef Stalin's support of a controlled economy with social realism in art and culture. Another case in point is American Progressivism, which advocated the breakup of large corporations by the state but also advocated prohibition, crusaded against pornography, and brought about the criminalization of narcotics. Some leaders, such as Adolf Hitler, were in favor of large corporation capitalism but also were in favor of traditionalism for cultural issues. Two more combinations should be added: the Spanish Anarchists, who favored a controlled economy but promoted liberalism in cultural issues, and the Austrian School of Economics, which was in favor of laissez-faire capitalism and were generally liberal on cultural issues.

Although support for social control of the economy was on the offensive during the first several decades of the twentieth century, that was often not enough to make one a socialist (Marxist) in the classical sense. The case in point is Franklin D. Roosevelt's New Deal policy. Was the New Deal an attempt to save capitalist free market or to introduce the socialist-style economy? Did President Roosevelt use the political rhetoric in such a way that it appealed to both conservatives and liberals but actually

pleased none of them? Latin American leaders make it often impossible to distinguish between the political program and political rhetoric. Was Juan Peron predominantly a Marxist or just a populist? What role did traditional anti-U.S. nationalism play in the presidency of populist Lázaro Cardenas in Mexico? Historians have argued both sides of the issue, and acts of these leaders, especially the gap between political action and rhetoric, make it possible to do so.

One can also say that the supporters of classical liberal democracy were often hard-pressed by forces of both right-wing and left-wing extremism, as is painfully illustrated in the case of Weimar Germany. Following one of the most serious economic crises in history, the forces opposed to representative government, such as the National Socialist German Workers' Party, known as the Nazis, and the German Communist Party, made steady gains at the expense of the Christian Democrats and Social Democrats. The Nazi slogan that democracies were weak had some support in the political reality. In actuality, both the communists and the Nazis argued that representative democracies were doomed to perish, but they attributed their obvious weaknesses to different causes. While the Marxists saw the conflict and corruption among the capitalists as normal (because it was predicted by Marx), the Nazis attributed it to a Jewish racial conspiracy and convinced a sufficient number of Germans that there was some truth to their outrageous claim.

In spite of their weaknesses, representative democracies in Europe and the Americas made at least one substantial leap forward by extending the right to vote to women. In this regard, the 1920 presidential election was the first in the United States that allowed women to vote on a national scale, as the Nineteenth Amendment to the U.S. Constitution was adopted just a few months earlier. Similar changes occurred throughout Europe and the Americas in the decades that followed.

—Alexander Mirkovic and H. Micheal Tarver

The Weimar Republic (1918–1933)

The German Weimar Republic was the product of the incomplete political and social revolution that swept away the Hohenzollern monarchy in 1918. For some Germans, its founding realized the democratic goals of the revolution of 1848; for others, it embodied Germany's humiliating defeat at the end of World War I. For still others, it was the betrayal of the socialist revolution. The new republic certainly was an important step in the democratization of German political life, but it did not break thoroughly with Germany's authoritarian past. On the contrary, it left much of the imperial political, social, and economic order unscathed, a condition that left the republic vulnerable to its enemies.

In January 1919 the Socialist Provisional Government organized the election of a constitutional convention (National Assembly). Fearing unrest in Berlin, the convention convened one month later in Weimar, a provincial city known for its cultural heritage. Dominated by the socialist and moderate liberal parties (the Weimar Coalition), the assembly created a parliamentary republic in which all Germans enjoyed the full range of basic civil rights and some social benefits. While concentrating legislative authority in the Reichstag, the assembly also called for a popularly elected president, who would appoint the chancellor (prime minister), head the military, and wield sweeping emergency powers. This latter authority would play a key role in the republic's undoing.

The Constitution did little to change Germany's Prussian-dominated federal structure or its system of political parties. Ranging from conservative to Marxist, the parties were now elected on the basis of proportional representation, although they continued to court the same interest groups as they had under the empire. Only late in the Weimar period would the Nationalsozialistische Deutsche Arbeiterpartei (National Socialist German Workers' Party, or Nazi Party) form a true people's party by attracting cross-class support.

The new parliamentary order also did not challenge the status of Germany's conservative aristocratic and industrial elites, who continued to dominate the economy and hold key political of-

fices. Fearing violent opposition, Weimar leaders failed to purge the monarchists from the officer corps, the judiciary, and other state institutions. As a result these institutions were unreliable, a problem that intensified as the republic encountered repeated challenges to its legitimacy.

The Weimar Coalition's decision to sign the Treaty of Versailles in June 1919 angered many who refused to accept Germany's defeat, its sole responsibility for the war, the requirement that it pay massive reparations, and the loss of its colonies, border territories, and military power. Others turned against the new democracy as successive governments failed to resolve repeated economic crises fueled primarily by wartime financing policies and the problems of demobilization, reconstruction, and reparations payments. The misuse of deficit spending to finance postwar costs, including the passive resistance against the French occupation of the Ruhr in 1923, fueled the onset of hyperinflation, which peaked in November of that year as the value of the German mark fell to approximately 4.2 trillion to the U.S. dollar.

Inflation bankrupted the middle class, undercut the unions, and enriched a small elite circle who manipulated the credit system. It also increased the strength of the radical nationalist and communist parties and led to popular unrest in several states. The government's use of emergency powers and foreign loans, the rescheduling of debts, and the introduction of a new currency (the rentenmark) stabilized the economy between 1924 and 1928. Although these steps eased political tensions, lingering high unemployment and government instability did little to raise public confidence. To many Germans, the republic had forfeited its legitimacy.

The Great Depression precipitated the republic's terminal crisis. Rising mass unemployment and poverty, escalating political violence, and the state's failure to ease the plight of the people led to the electoral collapse of most of the middle-class parties and to the rapid growth of the Nazi Party and the Communist Party. Between 1930 and 1932 these diametrically opposed parties collectively secured a majority of seats in the Reichstag and undermined its work. With the parliament paralyzed, Reich president Paul von Hindenburg appointed a succession of

REPARATIONS, WAR DEBT, AND INFLATION

In June 1923, the year this 1 billion German Papiermark note was printed, prices were 19,985 times those of 1914. Workers received and spent their pay every halfday before the money lost its value; the cost of a meal could rise between the time it was ordered and served. It was clear in 1919 that the newborn republic lacked the means to pay its \$32 billion war reparations. For a while it fulfilled its obligations by printing more bills, but as the mark depreciated in foreign markets, Germany defaulted. France, which was entitled to 52 percent of the reparations and owed war debts to the United States, occupied the industrially vital Ruhr to force payments. The Weimar government pumped out bills to pay the region's striking workers while simultaneously losing that tax revenue. In 1924 the Dawes Plan saved Germany by lowering annual reparations payments, introducing the gold-supported rentenmark, and providing U.S.-backed loans. Through this and the diplomacy of Gustav Stresemann, first chancellor and later foreign minister, France withdrew from the Ruhr, and the economy not only stabilized but grew. Stresemann died in October 1929 from overexertion just before his achievements collapsed with the crash on Wall Street. The United States recalled its loans, and the new Young Plan, while further reducing reparations payments, did

A one billion Reichsbank note from the German Weimar Republic, 1923. (germannotes.com)

not stop the Great Depression from mortally wounding the republic.

antirepublican chancellors who invoked emergency powers to rule by decree.

In July 1932 the Nazis became Germany's largest political party with 37 percent of the vote. The party won broad support across Germany by blaming Marxism, democracy, capitalist plutocrats, and Jews for the nation's misery as well as demanding the abrogation of the Versailles Treaty, the restoration of German national power, and the creation of a People's Community (*Volksgemeinschaft*) based on race. Reactionary elites around von Hindenburg now hoped to use the Nazis' strength in the Reichstag to dismantle the republican constitution. Thinking that the Nazis' charismatic leader, Adolf Hitler, could be controlled, von Hindenburg's advisers convinced him to appoint Hitler chancellor in January 1933. As it turns out, how-

ever, Hitler quickly outmaneuvered them. Using the pretext of a national emergency, within a few months Hitler eliminated his rivals and became a de facto dictator.

The political and economic weakness that characterized the republic's short life contrasted sharply with its many cultural achievements. In literature, film, art, music, architecture, and science, Germans took advantage of their freedom to challenge traditional norms and provide fresh perspectives. Writers such as the brothers Heinrich and Thomas Mann, filmmakers such as Fritz Lang, and architects such as Walter Gropius won worldwide acclaim, and their ideas remain influential to this day. But the creators of this Weimar culture did not have sole control of the field. Their ideas met strong opposition from conservative writers such as Ernst Jünger and Oswald

Spenger, whose works rejected, among other things, the pacifist, rationalist, and cosmopolitan tendencies circulating in postwar Germany. Their popularity demonstrated widespread discomfort with many of the modern elements of Weimar culture, an attitude that sections of the political Right successfully exploited.

The Weimar Republic represented a partial and temporary victory of those forces in Germany that had long sought to democratize the political and social order. That it proved ephemeral reflected the unfavorable national and international context in which the republic was born as well as the strength of Germany's conservative forces. The republic's fall was not inevitable, but its likelihood increased as a variety of circumstances, many outside of Germany's control, undermined social consensus and paved the way for the popular acceptance of the radical solutions proposed by democracy's enemies.

Big Government and Big Business in the United States

During the last decades of the nineteenth century, American businesses grew and consolidated at a dizzying pace. With little government interference, the rise of big business also led to a landscape of social Darwinism, in which laborers were deskilled and exploited, and to business corruption that went unchecked. Bribery of

public officials was widespread, while corporations swallowed small rivals. At the same time, the gap between the wealthy and the poor widened. To rectify the excesses of what came to be known as the Gilded Age, progressive politicians emerged (in both political parties) who focused on social reform and on the regulation of big business.

In 1902 President Theodore Roosevelt, the first progressive politician on the national scene, used the Sherman Antitrust Act (1890) to initiate a series of suits designed to break up business combinations colluding to restrain free trade. This action by President Roosevelt was a dramatic reversal of federal policy. To regulate business, Roosevelt's administration forged new federal departments, such as the Food and Drug Administration, and increased the regulatory power of existing agencies, such as the Interstate Commerce Commission.

Presidents William Howard Taft (Republican) and Woodrow Wilson (Democrat) continued Roosevelt's regulatory policies. While President Taft preferred to use the Justice Department to bring antitrust suits before the courts, President Wilson preferred to regulate business by placing experts in charge of public policy. The Wilson administration also initiated antitrust suits, gained passage of the Clayton Anti-Trust Act (1914), and created the Federal Reserve Board (1914) and the Federal Trade Commission (1915). During World War I the influence of the federal government over business reached its zenith. Through the U.S. War Production Board, the federal government managed the economy yet relied primarily on voluntary compliance.

In 1921 the U.S. government approved the plans of the American Telephone and Telegraph Company (AT&T) to consolidate the telephone industry, marking a reversal of Progressive Era policies. The probusiness Republican administrations of Presidents Warren Harding (1921–1923), Calvin Coolidge (1923–1929), and Herbert Hoover (1929–1933) staffed the federal regulatory agencies with candidates favorable to big business. Instead of regulation, the government now promoted the concerns of business as being in the best interest of the United States. When the Great Depression struck, President

Hoover created the Reconstruction Finance Corporation to provide millions of dollars to businesses in an attempt to restore the economy through a trickle-down effect.

The Great Depression led many Americans to believe that business leaders acted according to their own selfish motives and not in the public interest. Reversing the policies of the 1920s, President Franklin Roosevelt (Democrat) aggressively regulated big business. His administration reformed banking laws, created the Securities and Exchange Commission, established labor-friendly policies, restricted ownership of public utilities, and gave the Federal Reserve Board increased power to control the economy. The Tennessee Valley Authority, a federal regional development project, directly competed with business. Using the National Recovery Administration (NRA), President Roosevelt proposed a thorough reorganization of government-business relations, following the patterns established during World War I. The NRA, however, was unpopular because it tended to hurt the smaller businesses as well as seemed unduly restrictive to trade. In 1935 the U.S. Supreme Court declared the NRA unconstitutional, and after its failure the Roosevelt administration returned to greater regulation, including the initiation of several antitrust suits.

World War II saw a revival of the close relationship between big business and big government as America geared toward wartime production. The government pumped billions of dollars into industry to build all manner of war materials but also made demands, such as price and wage controls, strict rationing, and hiring rules. A federal directive, for example, ensured that African American workers would be hired at businesses with federal contracts. Despite some frictions—at one point Roosevelt threatened to nationalize Ford Motor Company for failure to comply with the government's demands—the war was a boom to industry, and not just those producing war materials. Wrigley gum, Lucky Strike cigarettes, Coca-Cola, and Parker pens, just to name a few, benefited from massive government orders.

By 1945 the relationship between big government and big business had transformed from

➤ BUSTING TRUSTS

A classic example of a Gilded Age monopoly, John D. Rockefeller's company Standard Oil gained control of nearly the entire American oil market in the late nineteenth century by relying on ruthless tactics. Whether it was finding loopholes in state laws, bribing government and railroad officials, or eliminating any and all competition, Standard Oil did whatever was necessary to control the market. In addition to oil refineries, Rockefeller extended his dominance into the source and distribution of oil as well as many supplemental industries. By the turn of the century, public opinion began to turn against Standard Oil. Journalists known as muck-rakers exposed the misdeeds of the company, and in 1911 the U.S. Supreme Court ordered that Standard Oil be broken up.

"No doubt the indictment of Mr. Rockefeller in the spring of 1879 seemed to him the work of malice and spite. By seven years of persistent effort he had worked out a well-conceived plan for controlling the oil business of the United States. Another year and he had reason to believe that the remnant of refiners who still rebelled against his intentions would either be convinced or dead and he could rule unimpeded. But here at the very threshold of empire a certain group of people—'people with a private grievance,' 'mossbacks naturally left in the lurch by the progress of this rapidly developing trade,' his colleagues described them to the Hepburn Commission—stood in his way."

Populism in Latin America

Populism emerged in Latin America during the 1920s and 1930s as a response to the limitations of exclusionary democracies and economic laissez-faire that had characterized Latin America since the nineteenth century. The various populist movements offered alternative political and economic models that incorporated previously marginalized social groups, in particular the urban working classes. Despite national variation, populist movements shared certain elements such as charismatic and personalist leadership, mass mobilization, a heterogeneous coalition of followers, nationalistic rhetoric, and a clearly reformist agenda that emphasized import-substitution industrialization and redistributive policies. Latin America's most notable populist leaders include Mexico's Lázaro Cárdenas (1934–1940), Brazil's Getúlio Vargas (1930–1945 and 1950–1954), Venezuela's Rómulo Betancourt (1945–1948 and 1959–1964), and Argentina's Juan Perón (1946–1955 and 1973–1974).

During the nineteenth and early twentieth centuries elites in Latin America maintained their countries' political stability through a combination of exclusionary politics based on suffrage limitations, electoral fraud, and strict mechanisms of social control. Favorable international conditions enabled these governments to embark on export-oriented economic programs that produced unprecedented economic growth. The Great Depression revealed the limitations of the export-oriented model and hit hard the political elites who had advocated it. In many Latin American countries the discontent associated with the economic crisis paved the way for the rise of populist movements.

Despite national variation, populist movements shared some common features. Populist

leaders had charisma, which is defined as leadership conferred to an individual perceived to have a set of talents and special qualities above the common people. Populist leaders resorted to different means to achieve and hold power. They encouraged electoral participation to expand their base of support and took advantage of new mass technologies, such as the radio, to spread their message across larger sectors of society. Once in power, populists did not hesitate to implement more authoritarian mechanisms to guarantee political stability and social control. Most decisions and responsibilities resided in the leader who, in many cases, ran the parties in unsystematic and personalist ways. This style of leadership enabled a leader to establish close paternalistic bonds with his followers. A rhetoric that emphasized popular symbols while stressing the leader's deep awareness of the needs of the people (a concept loosely defined) contributed to the growth of the movement and of the leader's mythical figure. The primary constituency of populist movements was the working class, whose support was obtained through the distribution of material benefits. Populist movements gave these masses a new sense of belonging. However, populist coalitions were multiclass and included members of other groups as well, such as the middle classes and the petit bourgeoisie. To maintain a broad electorate, populist leaders formulated eclectic and flexible platforms. Nationalism and national integration provided a pertinent set of ideas that spoke to many sectors and guaranteed the inclusion of disparate groups in society. Populist programs were mostly reformist compromises that prevented revolution by integrating into society previously marginalized groups and redressing their grievances.

Early populist leaders emerged throughout Latin America and included such men as Víctor Raúl Haya de la Torre in Perú, Arnulfo Arias in Panamá, José María Velasco Ibarra in Ecuador, and Rómulo Betancourt in Venezuela who challenged traditional leaders to become more democratic. Latin America's most notable populist leaders during the first half of the twentieth century were Getúlio Vargas in Brazil, Juan Perón in Argentina, and Lázaro Cárdenas in Mexico.

Lázaro Cárdenas assumed the presidency of Mexico in 1934, and once in power he created a

populist coalition that enabled him to achieve full control of the country and carry out important programs following the goals set out by the 1917 constitution. Land redistribution became a priority of Cárdenas's government. During his six-year term, 44 million acres (18 million hectares) of land were distributed to landless Mexicans. Cárdenas protected labor and gave support to the Confederation of Mexican Workers. In 1938 after a long labor dispute between oil companies and workers, Cárdenas announced the expropriation of foreign oil companies and subsequently created the state-owned *Petróleos Mexicanos* (PEMEX). This was the high point of his presidency, as the last two years of his tenure witnessed an increased deficit, inflation, and falling exports.

Getúlio Vargas assumed the presidency of Brazil in 1930 through a military coup. Once in power he centralized authority and replaced state governors with officials who reported directly to him. In 1934 his government enacted a new constitution that increased presidential power. Vargas also expanded the electorate by extending suffrage to women and citizens over 18 years of age. Furthermore, he gave to workers concrete benefits such as minimum wage guarantees, training and education programs, security of employment, and pension plans. On the other hand, the government increased its control over labor relations by eliminating the right to strike and by creating new unions. Vargas's regime became more authoritarian with the establishment of the corporatist *Estado Novo* (New State) in 1937. He ruled until 1945, when he was forced out by a military coup. Five years later Vargas became president for a second time, governing only four years until he committed suicide, overwhelmed by the pressures of dealing with the nation's inflation and his increasing opposition.

Juan Domingo Perón rose to national prominence after taking part in the 1943 military coup that ousted President Ramón Castillo. In Perón's position as secretary of labor, he granted important benefits to improve the conditions of workers in Argentina. In 1945 he was jailed, and thousands of workers demonstrated in his favor. After his release and taking advantage of his popularity, Perón started an aggressive political campaign that won him the presidency. During his administration, working conditions improved

➤ VENEZUELAN POPULIST

Rómulo Betancourt, president of Venezuela from 1945 to 1948 and again from 1959 to 1964, was one of the most influential figures in Venezuelan history. His program sought to diversify the Venezuelan economy, initiate land reform, and improve health and education for the population. The state had a paramount role in this process, and his political instrument was the *Acción Democrática*, a multiclass party created in the late 1930s that obtained the mass support of workers and peasants. On October 18, 1945, a military-civilian coup established a provisional government led by Betancourt. The following three years witnessed the first effort in Venezuela to transform the country's economic and social structures. As the Junta's provisional president, Betancourt passed a new electoral law and provided for universal suffrage, organized trade and peasant unions, and guaranteed workers' civil and social rights. On December 14, 1947, *Acción Democrática's* candidate Rómulo Gallegos won the elections but was overthrown in 1948. A decade later Betancourt won the presidential election in Venezuela once again. During his second term he distributed lands among peasants, increased investments in public education and health, raised taxes on oil profits, and encouraged industrialization through loans to private entrepreneurs. In 1964 he was succeeded by Raúl Leoni, which marked the first time in Venezuelan history that a democratically elected president transferred power to a democratically elected successor.

—Patricia Juárez-Dappe

sharply. Workers benefited from increased social spending by the state in the form of housing projects, health, and other social programs. His wife, Eva Duarte de Perón, became an important supporter of the regime and was instrumental in recruiting female supporters and voters. Women were granted the right to vote in 1947. Perón was reelected in 1951; however, economic problems and his increasingly authoritarian political style eroded his base of support. He was ousted by a military coup in 1955.

As the examples of Getúlio Vargas, Lázaro Cárdenas, and Juan Perón illustrate, although the various populist movements in Latin America

varied in their methods, they all shared a set of core traits, such as personalist leadership, mass mobilization, and a reformist agenda.

Authoritarianism in Latin America

Throughout history, many forms of authoritarianism have existed. For the most part, they have been associated with monarchical absolutism, traditional dictatorships, and most forms of military rule. Briefly, authoritarianism is a belief in or the practice of government "from above." Political rule is imposed upon the populace by an elite group, regardless of the consent of the former; policies and the political structure are elaborated to preserve and enhance the domination of the elite. Twentieth-century authoritarian governments in Latin America grew from the regimes of nineteenth-century caudillos (military strongmen), such as Porfirio Díaz (Mexico), Antonio Guzmán Blanco (Venezuela), and Gabriel García Moreno (Ecuador).

During the first decade of the twentieth century, while populism modernized politics in South America, the situation in the Caribbean basin was different. The harsh trend was brought on by a new generation of dictatorial politicians who became characterized by practices that nourished many negative stereotypes in the minds of North American and European writers, journalists, and travelers. This negative perception reached its maximum peak in the early twentieth century, the so-called Age of the Caribbean Dictators.

Dictators assumed command of their countries for a variety of reasons. First was the legacy of the nineteenth-century caudillo, which encouraged the violent seizure of power in the absence of a tradition of democracy. Second, the dictators exacted huge profits for their countries' exports. Petroleum, minerals, sugar, tobacco, and cotton sold for lucrative prices in U.S. markets. Third, the U.S. government sent military forces to occupy and govern several countries of the Caribbean basin and Central America. More often than not, when the U.S. troops withdrew the commanders of the National Guard forces assumed political control.

Most dictators of the early twentieth century had served as officers in their countries' armies. For the most part, the armies of the various Caribbean countries were nothing more than police forces that were used to maintain internal security. As a consequence, they often functioned to protect the economic interests of the wealthy elites and North American investors. Moreover, these forces were not true armies in the modern sense. Their officers entered into politics; fought each other; stole money, goods, and property; and generally cared little or nothing about the discipline of their men.

Once in office, Latin American dictators tended to hold onto power through fraudulent elections, various subterfuges, and the use of force. These dictators demanded obedience, adulation, and loyalty from the citizens. In fact, those who refused could expect persecution. These governors used crude but effective means to keep their opponents in line. On the whole, the Latin American dictators in the first half of the twentieth century were rather intelligent, despite their lack of regular schooling. What these leaders possessed was the political trickery and willpower to take advantage of their opportunities. Despite poor formal training, most of them exhibited an innate understanding of military tactics. They did not trust counterparts, often suspecting them of wishing to take power away. Thus, they rarely supported protégés for fear that they might become political rivals.

Manuel Estrada Cabrera in Guatemala and Juan Vicente Gómez in Venezuela are excellent examples of early-twentieth-century Latin American dictators. Both governed their countries for

➤ JUAN VICENTE GÓMEZ (1857–1935)

Rising to power as a supporter of Venezuelan president Cipriano Castro, Juan Vicente Gómez effectively ruled Venezuela from 1908 until his death in 1935. After seizing power from Castro in December 1908, Gómez officially served as the nation's president three times during this period, but he was generally understood to exert final political authority in Venezuela even when not officially head of the government. The Venezuelan leader came to symbolize caudillismo and political endurance, and Gómez often said that he needed “a lifetime to fulfill his political work.”

The authoritarian leader's greatest source of power came from the benefits of Venezuelan petroleum. Gómez successfully negotiated concessions to foreign oil companies, which garnered both domestic and foreign support, relative economic stability and growth for Venezuela, and a rapid increase in Gómez's personal fortune. Nevertheless, the leader maintained order through brutal and authoritarian tactics including the crushing of any political opposition through the use of secret police. Gómez died in Venezuela after a long illness.

nearly a quarter of a century. Afterward a new generation of dictators took over Latin America during the 1930s. Some historians have labeled these dictators “classic dictators.” Anastasio Somoza (Nicaragua), Fulgencio Batista (Cuba), and Alfredo Stroessner (Paraguay) are three examples of this new generation of dictators.

The reality was that by the twentieth century, most Latin American nations had no strong political and judicial institutions, which subsequently allowed the caudillo tradition to become stronger in one viable institution: the military. As such, it was this institution that supplied the authoritarian leaders. In the twentieth century, the classic nineteenth-century caudillo became a military man with a personal following and was generally independent of any institutional leadership role. Recent interpretations place the phenomenon within larger political, social, and

economic patterns. These include the breakdown of the power of the state as well as centrifugal regionalism and disorganized trade resulting from the effects of the early nineteenth century.

Progressivism

Progressivism in the first half of the twentieth century was a general movement for social, political, moral, and economic reform. The rise of big business along with its brutal competition and violent labor disputes made economic reform urgent. Social tensions caused by rapid urbanization, an influx of immigrants, corrupt political machines, and the rise of an urban middle class also forged the consensus for progressive reforms. Middle-class progressives felt threatened from above by the unchecked immoral greed of the robber barons and from below by the radicalism of an alien working class. To protect themselves and their concept of democracy, the progressives advocated an interventionist government at all levels. Such thinkers as Henry George, William James, Jane Addams, John Dewey, Herbert Croly, and Walter Lippmann, among many others, shaped progressive thought. Progressives drew much from trends in Europe, especially England, and were not afraid to take ideas from the socialist canon.

Several key assumptions underpinned progressive thought. First, progressives had a faith in the objectivity of the dispassionate expert to shape public policy. They drew economists, social scientists, and engineers into governmental service. Second, they believed strongly in placing the good of the community over the rights of the individual. As progressives saw it, unchecked individualism was out of place in the modern industrial world. Third, progressives rejected the social Darwinism and laissez-faire social attitudes that had guided the last quarter of the nineteenth century. Accepting that the environment played an important role in shaping individual behavior, they pushed for social improvements. Finally, progressives possessed optimism that a bureaucratic government could shape a socially just and responsible society.

At the urban level, progressives sought municipal ownership of important utilities, a system of licenses for businesses, regulation of rates for public transit, construction of parks and playgrounds, honest government, and sanitation and public health programs. At the state level, progressives investigated and regulated key industries and shifted more of the tax burden to

corporations and the wealthy and instituted the recall, initiative, and referendum to make government more accountable to the electorate. At the federal level, President Theodore Roosevelt used the Sherman Antitrust Act of 1890 to break up monopolies, enacted laws regulating railroad rates and the food industry, and instituted a program for the conservation of national resources. From 1913 to 1916 President Woodrow Wilson followed the path of progressive reform with a tariff revision that included a graduated income tax, the Federal Reserve Act, the Clayton Anti-Trust Act, and the Federal Trade Commission.

Triumphs for progressivism also included the Sixteenth, Seventeenth, and Nineteenth amendments to the U.S. Constitution, which allowed for the direct election of U.S. senators, the graduated income tax, and the women's right to vote. Progressive moral reform proved successful, as vice districts were closed in cities across America, movies were regulated, pornography was banned, narcotics were rendered illegal, and the Constitution was amended in 1919 for the prohibition of alcohol.

Progressivism reached its zenith during World War I, when the government regulated the economy to hitherto unprecedented levels. In addition to controls on production, pricing, and raw materials, labor and wages were protected in a manner generally supported by organized labor. In keeping with the focus on the greater good of the community, during the war the government shaped public opinion and restricted civil liberties.

The emotional pitch of 20 years of reform, the intensity of the war and ensuing peace treaty, and the tumultuous Red Scare soured the national appetite for progressive reforms. Save the 1924 presidential bid of Senator Robert La Follette and a handful of laws, progressives were overshadowed in the indulgent consumerism and probusiness atmosphere of the 1920s. The Great Depression changed this.

Progressives argued that economic inefficiency such as overproduction, ruinous competition, maldistribution of wealth, and unsound and unethical business practices caused the economic disaster. Elected in 1932, President Franklin D. Roosevelt promised Americans a New Deal, that is, an activist government in the progressive

JANE ADDAMS

Jane Addams was born in 1860. Inspired by settlement houses in England, she cofounded Hull House in 1889 in Chicago. Addams used Hull House as a form of outreach into immigrant communities where volunteers taught English classes and offered day care, guidance, and cultural events. In addition, Addams organized political movements in immigrant neighborhoods for sanitation collection programs and park construction. Her 1910 memoir, *Twenty Years at Hull House*, inspired a generation of progressives. In addition to importing the settlement house movement to the United States, Addams was a political reformer, suffragette, and pacifist and won the Nobel Peace Prize in 1931. She died in 1935.

mold. At first the New Deal looked to streamline the American economy to remove the inefficiency and overproduction that had presumably caused the Great Depression. In the banking system the New Deal strengthened the Federal Reserve Board's ability to manage the economy and regulated the ethics of the stock market under the Securities and Exchange Commission. To raise farm income Congress created the Agricultural Adjustment Act, which controlled prices by subsidizing farmers to leave fields fallow. Finally, in the industrial sector, Roosevelt created the National Recovery Administration (NRA), the centerpiece of the New Deal, patterned on the economic management of World War I. The NRA

was a failure at restoring the economy, and Roosevelt abandoned it when the Supreme Court ruled it unconstitutional.

At this point, Roosevelt moved less in the direction of sweeping structural reforms and more toward improving the purchasing power of consumers, often referred to as the Second New Deal by historians. Programs including Social Security, the minimum wage, abolition of child labor, and fostering labor union growth and collective bargaining were designed to increase the ability of Americans to buy more goods and services. Progressivism was giving way to liberalism, which placed more emphasis on the individual than on the community, took the consumer

economy into a greater account, and celebrated America's ethnic diversity. The final element that marked the transformation of older progressivism into liberalism was a strong belief in civil rights safeguards. Believing in the importance of the community over the individual, progressives did not have a strong regard for civil liberties and had even advanced the cause of racial segregation.

Proactive National Government in the United States

In the period between 1900 and 1945, the national government of the United States of America became increasingly proactive. This trend of increased governmental activity had begun during the American Civil War and proceeded

slowly throughout the nineteenth century. The pace of activism greatly accelerated after 1900, and by 1945 Americans had come to expect their government to regulate business in order to guarantee equal opportunity for all, provide a social safety net, promote commerce, protect the environment, and advance the general welfare of its citizens through action.

In the first two decades there were many groups who promoted a more active government for different reasons. Some business groups, led by the National Civic Federation, believed that federal regulation could stabilize the social and economic systems. Middle-class Americans looked to the government to act as a bulwark against both the avarice of the wealthy robber barons and the fears of radicalism among the immigrant working class. Labor groups argued that only a strong national government could protect the rights of workers. New professional organizations, representing such groups as doctors, lawyers, social scientists, and teachers, urged the government to codify their standards into law. Moral reformers wanted the government to regulate private behavior, such as what they saw as the evils of alcohol consumption. Each one of these groups lobbied the federal government directly instead of using the traditional method of securing passage of the same law (often referred to as model laws) in as many states as would pass them.

The goals of the reformers were followed by two strong-willed presidents in the first 20 years

► STRUCTURAL CHANGES

As the federal government increased its size and scope between 1900 and 1945, there were several notable reforms that improved the efficiency of government operations. In 1913 the Seventeenth Amendment to the U.S. Constitution provided for the direct election of U.S. senators. This was seen as a way to reduce the connections between corporations and the Senate. Also in 1913 the Sixteenth Amendment empowered the federal government to utilize an income tax. This measure shifted the collection of revenue from the tariff. Although modest at first and affecting only the wealthiest Americans, the income tax was in-

creased as needed to supply the funds necessary to meet the growing demand for federal programs. During World War II the income tax was expanded to the middle and working classes. In 1921 the Office of Budget and Management was created in the Executive Department to improve the federal government's reporting, forecasting, and budget planning. Finally, several attempts were made to reorganize the Executive branch in its entirety, the most important of which created a modern staff for the president, reorganized the departments, and generally streamlined the bureaucracy in 1939.

—Gregory J. Dehler

of the twentieth century: Theodore Roosevelt (1901–1909) and Woodrow Wilson (1913–1921). Although they belonged to different political parties, they both believed in an activist national government that acted on the principle that the public good superseded the rights of the individual. Roosevelt and his administration established a conservation program for natural resources, brought antitrust lawsuits against businesses, intervened in the anthracite coal strike of 1902 to prevent a shortage of home heating fuel, expanded the power of the Interstate Commerce Commission, established the Department of Commerce and Labor, and created the Food and Drug Administration to oversee new safety laws. Wilson saw the implementation of the federal income tax as part of the tariff reform of 1913 as well as the creation of the Federal Reserve System to regulate banking and the Federal Trade Commission, given regulatory oversight of business transactions, mergers, and rates. Although the U.S. Supreme Court later declared it unconstitutional, Wilson signed a law to ban child labor. During World War I Wilson vastly expanded the power of the government through conscription, sedition laws, and economic controls. When the war and the Red Scare ended, the powers of the government receded.

During the 1920s the focus of government activism shifted from business regulation toward promoting commerce and economic growth. Secretary of Commerce Herbert Hoover used his office to establish an elaborate federal framework for voluntary programs for businesses on a range of subjects from product standards to resource allocation. One area in which government power expanded dramatically during the 1920s was the field of law enforcement. This was due to the Eighteenth Amendment to the U.S. Constitution, which prohibited the sale and manufacture of alcohol. In response, the duties and size of the Federal Bureau of Investigation were greatly expanded.

The Great Depression shook the foundations of American society, and many citizens looked to the federal government to stabilize the economy and ease the burden of unemployment. President Herbert Hoover (1933–1937) responded with the most vigorous stimulus program up to that time, which included among other things economic

Worm-infested food seized under provisions of the Pure Food and Drug Act is destroyed in Washington, D.C., on November 20, 1909. Designed to protect consumers, the Act was created in 1906 during the administration of Theodore Roosevelt. (Library of Congress)

pump priming through the Reconstruction Finance Corporation. His programs failed to bring recovery, and when the public demanded more action, he balked.

In 1932 Franklin D. Roosevelt was elected to succeed Hoover as president. Immediately after his inauguration, Roosevelt initiated the New Deal reforms to stimulate economic recovery and individual relief, thereby shifting welfare from charity and the local level to the federal and state levels. Economically, the New Deal strengthened the hand of the Federal Reserve Board, and the national government took on the responsibility for insuring individual bank deposits. Business regulation included the Securities and Exchange Commission to oversee financial transactions as well as new agencies to oversee banking, public utilities, trucking, agriculture, aviation, oil, and communications industries, among others. During the New Deal the federal government used its power to level the economic playing field through the establishment of the right of collective bargaining, a minimum wage, a 40-hour workweek, and the Social Security program. The federal government also sponsored massive public works projects. Following the 1937 recession, the federal government assumed the role of managing

the economy through the use of its taxing and spending policies in a Keynesian manner.

There were limits to government activism, however. It did not benefit all people equally, as the federal government did not challenge the Jim Crow system of racial segregation in the South. The U.S. Supreme Court ruled Roosevelt's National Recovery Administration unconstitutional, as it attempted to regulate commerce that was not necessarily interstate. Roosevelt's new vision of the government as responsible for the social welfare of citizens, however, remained largely intact in the decades that followed the Great Depression.

The New Deal

President Franklin D. Roosevelt coined the phrase “New Deal” for the efforts of his administration and Congress to end the Great Depression. The New Deal marked an unprecedented intervention of government in the economy in hopes of putting people back to work, restoring the solvency of banks, and reinvigorating business and agriculture. In these efforts, the New Deal did not seek to replace capitalism with socialism, as critics of the New Deal on the Right charged, but rather sought to protect capitalism from its critics on the Left who wished to replace it. In this sense the New Deal was partially a conservative movement that sought to preserve capitalism rather than supplant it with a progressive economic system. Despite the refusal of Roos-

evelt and Congress to jettison capitalism, the New Deal marked a departure from the limited response of government to the economic depressions of the nineteenth century. In this regard, the New Deal was progressive in its use of government to better the lives of ordinary Americans. Being both conservative and progressive, the New Deal defies easy summation.

The New Deal arose as a response to the Great Depression. The stock market crash in 1929 marked the beginning of the Depression, although agriculture had been in the doldrums since 1919. By 1933, 15 million Americans, nearly one-third of the workforce, had lost their jobs. Construction, manufacturing, and investment all contracted, weakening business as the decline in commodity prices had hurt agriculture. In the 1920s the Republican Party had prided itself on minimizing government intervention in the economy. In 1932 voters repudiated this policy and elected Democrat Franklin Roosevelt president.

Amid the fear that banks were failing en masse as depositors scrambled to withdraw their money, Roosevelt, upon taking office in March 1933, closed all banks and called Congress into special session. Within weeks Roosevelt had restored calm and authorized the reopening of banks on a case-by-case basis. In an effort to curb expenses, Congress cut veterans' benefits and the salaries of federal employees. By reducing spending, the New Deal in its first days further deflated prices and wages. Congress, alert to the dangers of deflation, abandoned the gold standard in order to inflate the currency.

Having pared expenses, Congress, at Roosevelt's urging, created several federal agencies to combat the Depression. Between 1933 and 1936 the new Federal Emergency Relief Administration gave states \$3 billion to open soup kitchens, distribute food and clothing, and otherwise relieve the misery of the unemployed. In homage to the belief of Theodore Roosevelt, former president and cousin of Franklin Roosevelt, that people benefited from a life of outdoor activity, the Civilian Conservation Corps (CCC) put millions of young men to work building parks and roads. The Tennessee Valley Authority (TVA) built hydroelectric plants along the Tennessee River. The Agricultural Adjustment Act (AAA) sought to reduce the production of food

and cotton in hopes of increasing commodity prices, and the National Industrial Recovery Act (NIRA) sought to increase factory production as a way of putting people back to work. Among its provisions, the NIRA guaranteed the right of workers to bargain collectively with their employers. The Federal Deposit Insurance Corporation (FDIC) insured bank deposits.

Despite these efforts, the New Deal could claim only limited success during its first years. Although New Deal programs had put 2 million Americans to work by 1934, 10 million Americans still had no jobs, and nearly twice that number remained on relief. Expressing the frustration of many, Secretary of the Treasury Henry Morgenthau Jr. doubted that the New Deal had made much progress. Critics on the Left derided the New Deal for doing too little to help Americans, while those on the Right thought it had intervened excessively in the economy. Worse, in 1935 the U.S. Supreme Court declared the NIRA and the AAA unconstitutional.

Undaunted, Franklin Roosevelt launched the Second New Deal in 1935. Perhaps its most enduring achievement was the Social Security Act (SSA), which Congress enacted in June 1935. The act required both employee and employer to fund pensions for retirees and widows, payments to unemployed workers for a fixed duration, and payments to the disabled. The act also created Aid to Families with Dependent Children (AFDC), a welfare program that remained a cornerstone of social policy until 1996. Also in June 1935, Congress passed the National Labor Relations Act, known as the Wagner Act, reasserting the right of workers to bargain collectively in the absence of the NIRA. Despite the benefit to factory workers, the Wagner Act did not cover workers in the agriculture, services, or public (government) sectors.

Victorious in his bid for reelection in 1936 and fearful that the Supreme Court would overturn the legislation of the Second New Deal as it had the NIRA and AAA, in 1937 Roosevelt proposed to add four justices to the Court, increasing it from 9 to 13 justices. Critics, alert to the rise of totalitarianism in Europe, countered that Roosevelt was seeking to expand his power beyond the scope of the Constitution. The public, heeding these critics, turned against him. Even

THE BANKHEAD-JONES ACT

Among its stream of legislation, Congress, on June 29, 1935, enacted the Bankhead-Jones Act. Born of the New Deal commitment to agriculture, the act sought to raise farm prices by empowering the U.S. Department of Agriculture (USDA), the land-grant universities, and the agricultural experiment stations to conduct research on developing new markets for food and cotton. Amid the drought of the mid-1930s, the act led these institutions to conduct research on developing new methods of conserving soil and water. To accomplish these aims, the act gave the USDA and the states \$5 million a year for research. The act affirmed the eighteenth-century belief that science could improve the lives of farmers and committed the New Deal to the advancement of both science and agriculture. In the Bankhead-Jones Act, the New Deal emphasized the practical rather than theoretical value of science, an orientation in vogue since the colonial era. The act affirmed that science had a role in restoring prosperity, the central aim of the New Deal, and thus affirmed the position that science was a tool of economic policy. Perhaps most importantly, the Bankhead-Jones Act affirmed that science was more than a private enterprise. Science was a public activity that called on scientists to use the resources of government for the common good.

—Christopher Cuno

many Democrats, most of them conservatives from the South, deserted Roosevelt. The defeat of Roosevelt's Court-packing plan and his growing concern with foreign affairs ended the New Deal.

In the short term, the New Deal failed to end the Great Depression. Millions remained unemployed until the production of armaments during World War II spurred the recovery of industry, while the demand for food overseas restored prosperity to agriculture. World War II re-oriented the federal government toward the defeat of fascism and Nazism abroad rather than the pursuit of prosperity at home. In any case, the war, rather than the government, restored prosperity. Over the long term, the New Deal cemented the reputation of the Democratic Party as the party of reform. Its enthusiasts would preserve the impetus for reform into the 1960s, when President Lyndon B. Johnson, a Texas congressman during the New Deal, launched the Great Society. The Social Security Act and the Wagner Act continue to shape economic and social policy.

Women and Politics

In 1900 women in the United States possessed the right to vote only in Wyoming, Colorado, Utah, and Idaho. Despite the widespread lack of suffrage, women of this era possessed political power and influenced important social legislation. The defined gender roles of the time, sometimes called separate spheres, held that the husband worked outside the home while the wife served as caretaker to the children and guardian of the family morals and domestic

sphere. Tacitly accepting this ideology, more socially conservative women reformers argued for reforms outside the home as a means of protecting the morals of the family and so attempted to slowly extend the boundaries of the domestic sphere. At the same time, more radical reformers attacked the ideological basis of separate spheres and its assumption that women were appropriately relegated to domestic roles.

One example of a conservative reform was the drive to limit alcohol consumption. Between 1900 and 1920 women played a dominant role in advocating local temperance through dry laws and eventually nationwide prohibition under the Eighteenth Amendment to the U.S. Constitution. Other political issues in which women took part included improving education, regulating sweatshops and factory work conditions, banning child labor, promoting the construction of parks and playgrounds, advocating urban sanitation programs, and campaigning against prostitution. To advance their goals women founded advocacy organizations such as the Women's Christian Temperance Union, the General Federation of Women's Clubs, the National Consumer's League, and the Women's Trade Union League.

There was also a small yet more radical element of women who advocated a complete overthrow of the patriarchal society and the odious separate spheres ideology. Charlotte Perkins Gilman best expressed the ideas of the radicals in *Women and Economics* (1898) and her utopian novel *Herland* (1915).

Inspired by the British suffragettes, the National American Women Suffrage Association (NAWSA) led by Carrie Chapman Catt resumed an aggressive effort to lobby on behalf of women's right to vote after 1908. They were rewarded in 1910 when Washington state granted women the right to vote. By 1912 California, Kansas, Oregon, and Arizona had followed suit. Despite these victories there were also defeats, as referendums failed in Michigan, Ohio, and Wisconsin. Many men believed that women were not yet ready for the responsibility of voting. World War I accelerated women's suffrage, and President Woodrow Wilson came out strongly in favor of an amendment to the Constitution. The NAWSA and other suffrage groups lobbied state legislatures to pass the amendment. In addition,

more radical activists such as Alice Paul picketed the White House and led marches and protests, even if it meant being arrested.

The war highlighted divisions within the women's movement that would become more exacerbated during the 1920s. The moderate women of the NAWSA generally supported the war effort by selling war bonds, raising money for hospitals, and sending care packages to American soldiers. The radical women, however, did not support the war. In 1915 before American involvement, Jane Addams and others had formed the Women's Peace Party. They considered war a symptom of the sick and violent male-dominated oppressive society that they wanted to reform. It was more than symbolic that Jeanette Rankin of Montana, the first woman elected to the House of Representatives, voted against the Declaration of War in 1917.

On August 26, 1920, the Nineteenth Amendment to the U.S. Constitution granting women the right to vote was ratified. Women voted for the first time in a national election during the presidential election of 1920. But a women's voting bloc that politicians had both feared and courted never emerged. The bulk of the newly enfranchised women voted with a slightly smaller turnout but along the same party affiliation as did their husbands. During the 1920s the emerging consumer economy had a significant effect on women. Middle-aged women became the primary consumer of the home, and younger women were drawn to the decade's extravagance.

The division in the women's movement solidified during the 1920s. Alice Paul and the radicals urged women to use their new electoral strength to address their long-neglected concerns through the National Women's Party (NWP), which they had formed in 1917. Paul and the radicals considered the right to vote only the first step to more aggressive reforms, such as an Equal Rights Amendment to the Constitution that would ban all forms of gender-based discrimination. Although Congress conducted hearings, the NWP could not build enough public support for the amendment. Many working women did not stand behind the Equal Rights Amendment because they believed that it would hurt them by undermining some of the gender-based protective laws put in place over the previous 20 years.

➤ JEANETTE RANKIN (1880–1973)

Jeanette Rankin was born in Missoula, Montana, in 1880. Progressive reforms and women's suffrage drew her to politics. In 1916 she became the first woman ever elected to the U.S. Congress. She immediately confronted the issue of war and voted against American entry into World War I. Rankin served one term but devoted her life to antiwar activities and founded the Georgia Peace Society. Elected to Congress again in 1940, she cast the lone vote opposing the American declaration of war against Japan in 1941. She continued her antiwar activism up until her death in 1973.

(Library of Congress)

—Gregory J. Dehler

More moderate women considered suffrage an end in itself, a sign of equality, and disbanded their organizations. To better inform the newly enfranchised women voters they formed the nonpartisan League of Women Voters. Former suffragettes also advocated many progressive reforms, such as restrictions on child labor and the Sheppard-Towner Act, which put federal dollars into maternal care.

The Great Depression with its high unemployment rates was a difficult time for women because any woman working outside of traditional female occupations was seen as taking a job away from a male breadwinner. Despite this handicap, women made significant gains under the presidency of Franklin Roosevelt (1933–1945). First Lady Eleanor Roosevelt served as a vocal advocate of women and the reforms that progressive women espoused. President Roosevelt appointed Frances Perkins to the cabinet, Florence Allen to the U.S. Circuit Court of Appeals, and Ruth Brogan Owen as an ambassador, and these three individuals were the first women to hold those respective positions. Roosevelt also appointed women to the new agencies

formed during the New Deal. New Deal programs such as the Wagner Act (1935), the Social Security Act (1935), and the Fair Labor and Standards Act (1938) addressed issues such as work safety, poverty, and single-parent homes. While President Roosevelt addressed many concerns of women, he did not address all of them. He disappointed the First Lady and the largely women-dominated Council of Interracial Cooperation in failing to push Congress to make lynching a federal crime.

Despite the significant gains that women had made between 1900 and 1945 they still had not achieved equality in the political system. Although women had gained the right to vote,

they were seriously underrepresented in local, state, and national political offices.

■ Introduction: National Policy

A nation's ideological goals, reflected through official government statements, laws, and other actions, create its national policy. These policies necessarily vary for each nation, but throughout the course of the early twentieth century several commonalities among nations of every level of development existed. National policies developed as a result of international and domestic factors that the policies were designed to affect. Vast changes in economic conditions and two world wars proved more influential in the creation and implementation of national policy than anything else during this period. Domestic policies became more oriented toward the working and middle classes, while international policy focused on averting conflict between the Great Powers.

Dynamic changes in society resulted in domestic policies dominated by populism and economic reform. These two aspects of policy focused on improving the lives of the masses. Industrialized urbanization shifted populations more than ever, creating the need and desire for social reorganization. Populism in Venezuela, Mexico, and the United States shared several characteristics, including collective bargaining rights for workers, increased government regulation of the economy, and female suffrage. Re-

moving legal impediments to collective bargaining enabled workers to join together to secure better working conditions, shorter hours, and higher pay, thus empowering the workers to limit the abuses of their employers. Governments across the globe began increasing control over economic activity in reaction to the failure of laissez-faire economics, as experienced with the worldwide depression of the 1930s. The New Deal policies of the United States and the *Petróleos Mexicanos* in Mexico represent two instances of direct government intervention in economics. Women's suffrage also fell under the umbrella of populism as an important policy of the era. Women gained the right to vote and thus increased their direct impact on the course and development of the national government.

Isolationism, expansionism, and appeasement highlighted the international aspects of national policy. Many nations, including the United States, sought to remain outside of international affairs as much as possible. While Western imperialism remained aggressive at the turn of the century, it quickly declined among the established empires. Budding nations such as Germany, Italy, and Japan sought to enlarge their influence, as evidenced by their aggressive expansionism. Nations across the globe re-

mained mortified by the violence of World War I and desired peace regardless of the price, as evidenced in the cases of Germany and Japan and their expansions in Europe and Asia. Britain, France, and the remainder of the League of Nations had opportunities to stop Germany and Japan but ultimately did not do so. This bred mistrust and perceived weakness among other nations. In the end, the failures of the League of Nations and the timidity with which it approached the prospect of war emboldened expansionist nations.

Two world wars, a global economic crisis, and the urban shift restructured social and political conditions throughout the world. National policies adapted to these changing conditions. During the early twentieth century, the rising importance of the masses, aversion to warfare, and reaction to economic strife were manifest in the changes in national policies.

—*Ian Patterson*

U.S. Interventionism

From 1900 to 1945, U.S. interventionist foreign policy—or the direct forceful interference into the internal politics of other independent states—was justified through various ideological rationalizations. U.S. interventions in the Philippines, the Caribbean, Mexico, and Central America, for example, were justified with liberal and democratic rhetoric, despite the policy's disregard of the national sovereignty of the states toward which these actions were aimed.

U.S. interventionism from 1900 to 1945, as practiced from the McKinley through the Hoover administrations, attempted to distinguish American foreign policy from European colonialism by framing such actions as a means to establish liberal and democratic institutions abroad through U.S. paternalism. Despite this discourse, the Roosevelt Corollary to the Monroe Doctrine, as issued in 1904, justified U.S. intervention in the Western Hemisphere to ensure U.S. hegemony and protect U.S. interests if Latin American republics proved themselves “unstable” or unable to pay their foreign debts. Likewise, President Woodrow Wilson advocated “moral diplomacy,” seeking to impose U.S.

➤ GREATER EAST ASIA CO-PROSPERITY SPHERE

During World War II, Japanese colonialism was cloaked in the rhetoric of the Greater East Asia Co-Prosperity Sphere, with its central claim that Japan was liberating Asia from European domination to establish an “Asia for the Asians” under Japanese supremacy. In contrast with outright seizure of territories and the installation of colonial authorities or proxy governments, these interventions were presented as ventures for the benefit of the state and people whose territory was being invaded and/or occupied. The general tone was similar to that of the early-nineteenth-century Monroe Doctrine, which had placed the United States in the role of regional leader after the withdrawal of European colonial powers in the Americas.

Japanese expansion in East Asia and Southeast Asia was presented as a means to empower Asian peoples through the defeat of European colonialism. The stated goal of the Greater East Asia Co-Prosperity Sphere was to replace white regimes that sought to exploit Asian peoples with a Japanese regime that would allow Asians differing levels of autonomy and ensure economic and political rights. Official Japanese propaganda presented this as a viable alternative to the people of Dutch Indonesia, French Indochina, and British Malaya, with some initial acceptance. While certain contingents of these territories collaborated with Japanese occupation authorities, overall, Japanese colonialism in these regions followed the same pattern of exploitation as practiced by European colonial authorities. Some indigenous rulers, such as Sukarno in Indonesia, benefited from Japanese authority; however, most regions under Japanese occupation suffered exploitation, leading to resistance and guerrilla movements, such as that of Ho Chi Minh's Vietminh in French Indochina.

—*Abraham O. Mendoza*

hegemony through force when governments proved “unstable” as perceived by American commercial interests or diplomatic aims. U.S. military and intelligence actions in Colombia, which encouraged Panamanian rebels to separate from Colombia for the purpose of ensuring the attainment of the Panama Canal territory, is an overt instance of this policy. Similarly, interventionism in Cuba and the Philippines after

the Spanish-American War were also attempts to ensure American domination of these regions through the utilization of the rhetoric of freedom and democracy. Regardless of the nature of warfare in the U.S.-Philippine War and the imposition of the Platt Amendment (1901) on Cuban sovereignty, American interventions abroad were presented to the U.S. public as unselfish actions for the benefit of those affected.

The most overt cases of U.S. interventionism involved the installation of an authoritarian regime in Nicaragua. U.S. intervention in Nicaragua began in 1912, when U.S. marines were sent to “protect” U.S.-backed President Adolfo Díaz. Armed resistance by Nicaraguan forces was quashed by U.S. troops, thus securing Díaz’s authority. This set a long-standing precedent for U.S. interference in that country’s politics. During the interwar period, U.S. policies regarding Nicaraguan internal politics resulted in the installation of the Anastasio Somoza García regime. U.S. interventions in Mexico, particularly the occupation of Veracruz and the U.S. raid into Mexican territory after Pancho Villa’s attack on Columbus, New Mexico, both during the Mexican Revolution, were the most overt examples of violations of Mexican sovereignty.

The U.S. occupation of Haiti, which lasted from 1915 to 1934, to ensure debt payments and the “protection of American interests” was a gross violation of that country’s national sovereignty. Similarly, the United States established a protectorate over the Dominican Republic in 1905 after a two-year military occupation that followed the same rationale. It was not until Franklin D. Roosevelt’s more conciliatory foreign policy that U.S. relations with Latin America improved. Two events in 1934 best demonstrate the improved relations: the removal of U.S. troops from Haiti and the signing of the Treaty of Relations with Cuba, thereby repealing the Platt Amendment. The outbreak of World War II also ensured that the United States would seek greater Pan-American cooperation, in contrast with earlier policy that sought to impose U.S. hegemony throughout the Americas.

Isolationism

Isolationism describes the desire of a nation to exempt itself from involvement with other nations and to occupy itself simply with matters within its own borders. This policy, often prompted by xenophobia, or fear and hatred of other peoples, characterized the actions of numerous nations before the twentieth century. Historically, isolationism had been more prevalent in non-Western nations than in Western nations, which since the fifteenth century had been keen to expand their boundaries. In Asia, several countries had managed to maintain semi- or completely closed societies well into the nineteenth century, chief among those were China and Japan. However, a series of global wars in the first half of the twentieth century and the exponential growth of communications and transportation made it nearly impossible for any nation to be truly isolationist after 1945.

The case of the United States perhaps best illustrates this change. While the United States by the end of the twentieth century was the single most powerful nation in the world, it had a long tradition of isolationism and neutrality. In his farewell address, George Washington warned the infant nation against “foreign entanglements.” The policy of neutrality first articulated by Washington characterized U.S. foreign policy for much of the nation’s first two centuries.

That policy was challenged as the U.S. government got caught up in the race for empire in the waning decades of the nineteenth century. Still, those foreign involvements were perceived to be an aberration, and a majority of Americans at the beginning of the twentieth century believed in an “America First” policy, putting U.S. domestic concerns above those of their international counterparts.

Throughout the first few decades of the century, this sentiment prevailed, with the exception of intermittent interventions in Latin

America meant to secure and safeguard the economic interests of U.S. companies. World War I put the first real cracks in the isolationist armor of the United States, however. President Woodrow Wilson sought to create a League of Nations, which would provide collective security to member nations in the hope of offsetting another world war. Even though the United States did not join the league, after World War I, the nation struggled to maintain its political and economic distance from the rest of the world.

Only two decades later, European calls for help in the fight against such fascist aggressors as Adolf Hitler and Benito Mussolini gradually drew the United States into closer economic and military ties with England, France, and other European nations. By the late 1930s, as the United States inched toward full involvement in the war, the isolationist impulse continued to influence U.S. policy. For example, the United States resisted getting involved in saving the threatened Jewish populations of Europe; in 1938, a shipload of several hundred German Jewish refugees unsuccessfully sought asylum in the United States. American authorities turned them away, and they were forced to return to Germany, where they all subsequently perished. Three years later, after the Japanese attack on Pearl Harbor, the United States finally renounced isolationism and joined the Allies in their struggle against the Axis Powers.

China's policy of isolationism illustrates one of the dangers of such a policy: the potential for unchecked abuse of power by the government. For example, in 1930, there were approximately four million Chinese children reportedly held in slavery. Abuses of that sort increased after China became a communist nation in the middle of the twentieth century. Yet the turn to communism forced the Chinese at least partly out of its isolationism, for it sought to maintain buffer zones along its borders, especially in Southeast Asia.

China's neighbor Korea also had a tradition of isolationism, a tradition that was challenged on many occasions by other nations, both friendly and unfriendly. Korea's struggle to maintain its goal of isolationism was difficult, in large part because Korea was of strategic geographic importance. After Japanese occupation of Korea ended following World War II, any thoughts by the Koreans of returning to a policy of isolationism were

quickly erased. The Chinese and Soviets' desire to spread communism, a goal that Western powers resisted, played a big role in Korea's future. Both sides found Korea's existence as a bridge to the Asian mainland increasingly attractive, and the Korean War (1950–1953) became the first real battle in the Cold War. At the end of the Korean War, the nation was divided into two distinct political entities, North Korea and South Korea, both of which continued throughout the century to be of critical strategic importance.

Another Asian nation that struggled to cling to its isolationist goals was Japan. Perhaps more than any of its Asian counterparts, Japan maintained a policy of isolationism for centuries. That tradition of isolationism was interrupted during a couple of periods in the nation's history: during the sixth and seventh centuries Japan sent students to China to acquire information about that nation's advanced technology; and by the middle of the nineteenth century, Japan was lured by economic prospects to enter into trade agreements with the United States and various European powers. However, Japan did remain a closed society, deeply steeped in tradition and virtually completely self-reliant, until well into the twentieth century.

During World War II, Japan became involved directly in world affairs, as it joined the Axis Powers in the war against European and American Allied forces. During the war, Japan invaded and took control of part of China but lost it when defeated by the Allies. After the war, Japan, under Allied occupation, became a democracy. By the last quarter of the twentieth century, Japan had turned virtually completely away from its isolationist heritage to become a key factor in the world's marketplace and an important political force.

Those changes were paralleled in Mongolia. That nation had long struggled to maintain its independence from its Asian neighbors. China in particular posed a threat to that aim. Like many of its Asian counterparts, Mongolia's history of isolationism, although often challenged by outside forces, resulted in a very homogeneous society. The year 1924 marked a change in Mongolian policy, as it became a communist nation and turned even more ardently inward.

Frequently, nations have retreated into a policy of isolationism at inexplicable times.

Argentina, for example, was the fourth-most prosperous nation in the world in the 1930s and enjoyed a standard of living equal to that of the United States and as good as, if not better than, most European nations. World War II, however, wrought transformative changes in Argentina. In the aftermath of the war, Argentina changed politically, socially, and economically, and as a result, suffered in all those areas. It remained essentially isolationist until 1989.

In summary, World War II forever changed the relationship of most isolationist nations with the rest of the world, and indeed international relations writ large. In the aftermath of the War, the United Nations (UN) was created, its aim to maintain a kind of global police force that would check the behavior of aggressive nations and provide a sense of collective security to all its member nations. Another important mission of the UN was to oversee human rights throughout the world and to sanction nations that engaged in human rights abuses. The attention paid to such matters put isolationist nations under significantly more scrutiny than they had been before the creation of the global alliance of the UN.

Appeasement

The foreign policy of appeasement is associated with British and French diplomacy vis-à-vis Nazi Germany during the late interwar period. By definition, appeasement is the policy of offering

concessions through negotiation rather than through conflict. In this instance, it refers to the concession of territory to avoid armed conflict. The policy has historically been associated primarily with British prime minister Neville Chamberlain's diplomacy in regard to negotiating the transfer of the Sudetenland region in Czechoslovakia to Germany, with no regard to the position of the Czechs at the Munich Conference of 1938. French reliance on British military support made them support any policy that came out of London. The strategy of appeasement also characterized British, French, and League of Nations policy regarding the Italian invasion of Ethiopia (1936) and Germany's annexation of Austria (1938).

Memories of World War I and the international economic situation strongly influenced British and French foreign policy in the late 1930s. Public opinion in both Britain and France was particularly opposed to entering into a major conflagration with the revisionist powers of Germany, Italy, or Japan. The belief that a second global war would mirror the trench warfare of World War I frightened many among the British and French public, who still remembered the large casualties and the loss of a huge proportion of their young men. Images of the destruction caused by strategic aerial bombardment in the Sino-Japanese War (1937–1945) on the cities of Shanghai and Nanking as well as the German Air Force bombing of Guernica during the Spanish Civil War also raised apprehensions of what war would bring. Given the financial constraints created by the Great Depression, defense spending was seen as an unnecessary expenditure for the state. Responsive to public opinion and concerned with the financial consequences of war, high government officials, such as British prime minister Neville Chamberlain and French foreign minister Georges Bonnet, were avid supporters of appeasement. These leaders also overestimated German military power, strengthening their belief that it would be catastrophic to enter into a war.

The failure of the League of Nations policy of collective security and suspicions of the Soviet Union also led to the appeasement of the revisionist powers. After World War I, the League of Nations was established to secure international collaboration to prevent aggression with

recourse either through sanctions or military intervention. The League of Nations, whose main support was Britain and France—given that the United States was not a part of it and the Soviet Union only joined in 1934—failed to ensure collective security. While issuing condemnations against Japanese aggression in Manchuria in 1931 and the Italian invasion of Ethiopia in 1936, the League of Nations essentially did nothing else, thereby illustrating the impotence of the international body in enforcing international peace. This permissive climate encouraged the revisionist powers to seek further expansion at the expense of weaker powers. British and French officials also hesitated in allying with the Soviet Union. They were suspicious of the Soviet Union's international designs, particularly after learning of the Great Purge as well as the Soviet involvement in the Spanish Civil War. Some of these officials actually thought of Nazi Germany as a "bulwark against communism," given the international activity of the Comintern in the past decades at directing the policies of European communist parties. Moreover, leaders of East European nations, such as Poland and Romania, did not wish to allow the Red Army to go through their respective national territories for fear that they might never leave. Britain and France were reluctant to go against the wishes of these East European states.

British and French appeasement of the revisionist powers took various forms: condemnation without sanctions, the overlooking of flagrant violations of international law and/or agreements, or efforts to negotiate on the behalf of slighted powers. Japanese aggressions in the Far East particularly those against China, while met with official condemnation, were not met with sanctions or military threats. British and French politicians and officials did not see their national interests at stake. German and Italian involvement in the Spanish Civil War (1936–1939) on the side of Francisco Franco's Nationalists, while a clear violation of the Non-Intervention Agreement of 1936, which stipulated that no outside power would assist either side and that signees would actually assist in monitoring such actions, did nothing to sway Britain and France. Fears that such involvement could trigger a major European war prevented the British and the French from breaching

➤ THE FAILURE OF COLLECTIVE SECURITY— WESTERN SUSPICIONS OF THE SOVIET UNION

In contrast with appeasement, the policy of collective security purported that aggression by revisionist powers in the late 1930s needed to be addressed by members of the League of Nations, primarily the Great Powers of Britain, France, and the Soviet Union (after 1934). Collective security could only work if Britain and France would allow the Soviet Union to pass through East European countries to attack Germany from the east while Britain and France advanced in the west. However, the Little Entente Powers (especially Poland and Romania), which were already aware of France's reluctance to partake in an offensive war and its preference to stay behind the Maginot Line, were not prepared to allow the Soviets on their soil. Furthermore, French reluctance to go to war without British support, when the British were not prepared to go to war over eastern Europe, further antagonized the Soviet Union, which viewed this as a sign of the weakness of liberalism against fascism. British and French appeasement of Germany and their reluctance to come to terms with the Soviets, also fueled by fears of Bolshevism, eventually led to the Nazi-Soviet Non-Aggression Pact of 1939, which allowed Germany to turn its full fury against the West.

—Abraham O. Mendoza

the issue, even after flagrant German, Italian, and Soviet involvement (on the side of the Spanish Republicans). The Italian invasion of Ethiopia, widely condemned by the League of Nations and individual member powers, met with sanctions; however, sanctions did not cut off oil supplies to Italy. Furthermore, British foreign secretary Sir Samuel Hoare and French prime minister Pierre Laval attempted to come to a secret understanding with Italy, known as the Hoare-Laval Pact, that would allow Italy to annex two-thirds of Ethiopia in an effort to maintain Italian support against German expansion. However, when publicized, this offer led to the dismissal of these two men from office, as it showed that they were willing to concede foreign territory to ensure their own national interests.

The Munich Conference of 1938, in which Neville Chamberlain and Adolf Hitler, along with

French prime minister Édouard Daladier and Italian prime minister Benito Mussolini, decided against Czechoslovakia and essentially handed over the Sudetenland to Nazi Germany, was the high point of appeasement. The failure of collective security through the inaction of the League of Nations, the inability to come to an agreement with the Soviet Union, the widespread fears of war, and the current economic problems all culminated at Munich in a British and French decision to negotiate on behalf of other states (no Czechoslovakian officials were allowed at these meetings). Chamberlain returned to Britain promising “peace in our time” to jubilant crowds, indicative of the public support in the United Kingdom that he had in preventing war. However, this last-ditch effort to stem German expansion proved to be a failure. Czechoslovakia was swallowed up by the Third Reich in March 1939, with the occupation of Bohemia-Moravia, the establishment of Slovakia as a German protectorate, and the small region of Teschen going to Poland.

Expansionism

Before World War I, expansionism across much of the world was still characterized by European colonial expansion, triggered by commercial growth and Great Power rivalries. However, with the end of World War I, much of the expansionist policies of the Great Powers were at the expense of the defunct German and Ottoman empires, whose former colonies were set up as League of Nations Mandates. In the interwar period, amid the economic chaos of the global Great Depression, expansionism was characterized by revisionist states such as

Nazi Germany, fascist Italy, and imperial Japan in their quests to expand their territories owing to either economic necessity or ideological and political goals. These expansionist policies would eventually trigger World War II in Europe and the Far East.

From 1900 to 1914, the European Great Powers were the main contenders for global expansion along with the United States and Japan, which had also recently acquired colonial holdings. While much of Africa and Asia had been carved up into colonies or spheres of influence in prior periods, conflicts among the Great Powers were affected by events in their respective empires. In an effort to colonize the remaining scraps left on the globe, the Great Powers would clash, sometimes leading to major conflagrations. The Russo-Japanese War (1905), which served as evidence of Japan's entry into the Great Powers, is an example of how border skirmishes could trigger a war among the major powers. Among other factors, imperial rivalries played a role in unleashing World War I. It particularly marked Germany's ambitions for hegemony in Europe.

After the guns fell silent on the western front in World War I, the process of rebuilding the world was marred by the efforts of Britain, France, and Japan to grab the spoils of war at the expense of the former German and Ottoman empires. While U.S. president Woodrow Wilson used the rhetoric of self-determination to create a new order in Europe among the wreckage of the defeated Central Powers, the League of Nations ceded former German and Ottoman territories in the Middle East and the Pacific to the British empire, France, and Japan as League of Nations Mandates, to be allowed self-rule in the future but to be immediately occupied and ruled under the tutelage of these Great Powers.

Revisionist foreign policies on the part of Germany, Italy, and Japan during the 1930s, partly triggered by the Great Depression but also influenced by domestic political ideologies, led to a period of expansionism that eventually triggered World War II. Beset by economic and political chaos at home, Germany, Italy, and Japan embarked on an aggressive foreign policy aimed at expansion close to home rather than overseas.

► TREATY OF BREST-LITOVSK (1918)

In the last year of World War I, German desires for expansion in eastern Europe were manifest in the Treaty of Brest-Litovsk, signed on March 3, 1918, by Germany, Russia, and other Central Powers. In the aftermath of the October Revolution, the Bolsheviks' desire to exit the war led them to seek peace with Germany. However, Germany sought to capitalize on Russian weakness to extract huge territorial concessions for itself and its allies. Given these circumstances, the Bolsheviks had no choice but to concede the Baltic States (Latvia,

Estonia, and Lithuania), Poland, Belarus, and Ukraine to Germany, with smaller concessions to the Ottoman empire along the Ottoman-Russian border. While this treaty was nullified with the end of the war later that year, it still illustrated German foreign policy toward eastern Europe and Russia. Within two decades, there would be another attempt to seize these same European territories, this time under the aegis of National Socialism.

—Abraham O. Mendoza

Nazi Germany, under the rule of Adolf Hitler, sought to annex its former territories as well as the German regions of the former Habsburg empire (Austria and the Sudetenland) while also creating a series of alliances with Central European nations to create a German-controlled economic zone to contend with the rampant protectionism amid the Great Depression. Furthermore, German ambitions were based on the concept of *Lebensraum* (living space), as purported by Hitler in his biography *Mein Kampf* (1925). Italy sought to conquer Ethiopia in 1936, mostly to sate its imperial designs but also to supposedly quench its economic desires. Along the same lines, Japan sought to expand at the expense of China through the seizure of Manchuria and the establishment of the puppet state of Manchukuo in 1931 as well as with the move to create the Greater East Asia Co-Prosperity Sphere. Both German and Japanese aggressions would later be characterized by roughshod conquest of foreign peoples and their subjugation to new forms of imperialism, characterized by slave labor and genocide.

Women's Suffrage

During the period 1900–1945, as an outcome of concerted political activism, the right of women to vote in democratic elections was granted in most of Europe, North America, and much of Asia and Latin America. While in some cases women's suffrage was granted to all women for all elections, in many cases the franchise was extended gradually, either by territory, age, or class.

During the last half of the nineteenth century women had sought greater rights, and the right to vote was one of them. Others included the ability to own property, to inherit a husband's estate, to retain custody of children, to maximize work hours, and to gain access to education. Demand for suffrage grew louder as the numbers of educated women increased. The outline of the arguments used to support women's suffrage in the twentieth century were basically those stated at the Seneca Falls Convention of 1848 and by English philosopher John Stuart Mill in *The Subjection of Women*, published in 1869. Women, these supporters of suffrage had argued, were equal citizens deserving of equal rights. They too had an interest in good and efficient government. Moreover, their social role as guardian of the home required them to take political action to protect their families and to promote reforms such as temperance that could improve domestic and civil order. Still, there were many who opposed women's suffrage, believing that women lacked the emotional balance and education to pass judgment on important issues. More

➤ SUFFRAGETTES' HUNGER STRIKES

The first known use of a hunger strike as a tactic in the British suffrage movement was in July 1909 by Marion Wallace Dunlop, when she was arrested and sentenced to one month in prison. After 1908, imprisoned suffragettes had been regarded as criminals by the authorities and were therefore denied privileges that they had once enjoyed, such as wearing their own clothes. Dunlop asked that she be treated as a political prisoner and when her request was denied, she began a hunger strike which eventually led to her release after refusing food for 91 hours. This method of protest was quickly taken up by other suffrage prisoners and was endorsed by the Women's Social and Political Union (WSPU) as a way to gain sympathy for the cause.

Although at first women who went on hunger strikes were released, the British government changed its policy by the autumn of 1909 and women were force-fed, a painful procedure that permanently damaged the health of some of those who endured it. Following adverse publicity surrounding the procedure by publications such as *Votes for Women*, the official newspaper of the WSPU, the Cat and Mouse Act was passed in

1913. Under its provisions, hunger strikers could be released from prison and then rearrested once their health had improved.

Hunger strikers gained considerable sympathy from many members of the public, and *Votes for Women* repeatedly portrayed them as martyrs. In Britain, hunger strikes came to an end in 1914, when suffrage prisoners were released at the outbreak of World War I. Hunger strikes continued to be used by women in other countries who were still trying to gain the right to vote. In Mexico, for example, it was after María García and her followers had staged a hunger strike that the president agreed to submit a bill to amend the constitution to enable women to vote and to hold office.

conservative societies still relied on deference to the male to hold the family together, and orthodox religious sentiment frequently worked against women.

Prior to 1900, only New Zealand had full women's suffrage. Partial suffrage existed in Sweden and Australia, and four states in the United States had granted the right of women's suffrage in the late nineteenth century. Between 1906 and 1916, Finland, Norway, Denmark, Iceland, and most of Canada extended the franchise to women. In Britain and the United States, suffragettes led by Emmeline Pankhurst, Carrie Chapman Catt, and Alice Paul used protest tactics to push their agenda. Some of the large street rallies and speeches turned into riots when the police arrived and arrested activists.

The cause of women's suffrage accelerated at the end of World War I. Between 1918 and 1921 Austria, Belgium, Czechoslovakia, Estonia, Germany, Latvia, the Netherlands, Poland, Swe-

den, and the United States granted full suffrage, and Great Britain extended the franchise to all women over the age of 30. The pace of women's suffrage slowed later in the decade, although both Britain and Ireland removed its age requirement in 1928 and allowed all women to vote.

During the 1930s, women's suffrage made gains in Latin America and Asia. By the end of World War II, 12 Latin American nations and 7 Asian nations extended partial or full women's suffrage. The Government of India Act of 1935 granted both Indian men and women the right to vote. In addition, three more European countries granted women's suffrage. The last nations to grant women's suffrage before the end of 1945 were Bulgaria, France, and Japan.

No significant women's political party took root in any of the countries that granted women the right to vote by 1945. In some nations where women had the right to vote, traditional patterns of deference to males and religious mores often

discouraged them from exercising their suffrage, especially outside the metropolitan areas. In addition, some of the gains made toward women's suffrage between 1900 and 1945 were erased by antidemocratic fascist and communist governments in the political turmoil of the interwar years. Following the conclusion of World War II, the United Nations Universal Declaration of Human Rights of 1948 called for elections and universal suffrage, setting women's suffrage as a global ideal.

Creation of the Welfare State

The period between 1900 and 1945 saw the building of the intellectual, institutional, political, social, and economic foundations of the welfare states of the post-World War II era. The term “welfare state” only came into use in the 1940s.

During the early decades of the twentieth century, the laissez-faire concept of free-market liberalism—which dominated governmental policy in the late nineteenth century—gave way to the concept of the state taking some responsibility for the material welfare of its citizens. Several factors contributed to the change of attitudes. Industrialization dramatically altered the social landscape, thereby creating great wealth for a few and great poverty for many. The old system of family and private charity proved unable to provide support during times of need. Intellectuals, ranging from Karl Marx to John Dewey, successfully argued for greater governmental

powers to alter the imbalance between wealth and poverty. Conservative politicians, such as Otto von Bismarck of Germany, used the welfare state to undercut support for the more radical reforms of the socialists. As the franchise was expanded down the economic ladder, the new voters exerted pressure on the government to provide an economic safety net.

By 1900 Denmark, Germany, and New Zealand had the most advanced welfare systems with an old-age pension, unemployment insurance, and workman's compensation. Other states had established food safety laws, public education systems, and economic regulation of corporations to varying degrees. To pay for the welfare systems, states enacted tariffs as well as value-added and income taxes. By 1911 Australia and Great Britain had introduced government pensions for the indigent elderly.

During World War I all of the governments of the belligerents greatly expanded the role of the state through measures such as the enforcement

➤ GROWTH OF THE WELFARE STATE

In the midst of the welfare state's growth in the early half of the twentieth century, there were several intellectuals who called attention to what they saw as potential dangers of the new system. Inspired by Adam Smith's *The Wealth of Nations* written in 1776, these economists argued that an unfettered market was the best insurance to human happiness. Conversely, excessive government interference in the form of rules, regulations, and controls would create a dependent, controlled, and ultimately unhappy population. Although there were many more who wrote in this vein, three important works at this time were *Socialism* (1922) by Ludwig von Mises, *Challenge to Liberty* (1934) by former U.S. president Herbert Hoover, and *The Road to Serfdom* (1944) by Friedrich Hayek. Hayek argued that welfare programs and regulation formed the thin edge of the wedge that separated people from their freedom. As the government penetrated deeper into the economy, it accumulated more power and inevitably evolved into an authoritarian regime beyond the control of the people and leading to a new form of serfdom.

—Gregory J. Dehler

of conscription, increase in taxation, centralization of economic decisions, and nationalization of key industries. Agreements were made between the government and organized labor in which the unions pledged not to strike in exchange for a minimum wage and increased insurance. The state also regulated private behavior, such as alcohol consumption, in the name of the public good. The Bolshevik takeover in Russia in 1917 marked the emergence of an all-powerful state that subverted the rights of the individual for the benefit of the state. The Bolsheviks redistributed land, eliminated private ownership, centralized the economy, and established a state-run health care system.

After the war, millions of disabled veterans were added to the social welfare system. Industries that had been nationalized during the war were privatized, taxes were reduced, and labor's gains were either limited, as in the case of Great Britain, or entirely lost, as in the United States. The Great Depression, which began in 1929, renewed the demand to expand the welfare state as the capitalist economies of the world collapsed. Governments took responsibility for unemployment, housing construction, currency management, and employment. During the 1930s Belgium, Canada, France, Greece, the Netherlands, Norway, Sweden, and the United States established or strengthened their welfare systems.

Although the European model of the welfare state did not take hold in Latin America, nationalist leaders in Brazil, Colombia, and Mexico built populist governments and enacted programs of land redistribution and nationalized natural resources. The British economist John Maynard Keynes advanced the idea that the state should replace the market as the regulator to the economy through its spending policy.

The additions made to the state over the first 45 years of the twentieth century would be consolidated and rationalized after World War II. By the end of the war a consensus had emerged in western Europe that included new concepts of rights, such as health care and full employment, that the state should guarantee.

■ Introduction: Official and Nationalistic Art

In an effort to construct national identity and foster unity across multiethnic populations, the development of official state and nationalist art in much of the world from 1900 to 1945 emphasized national greatness and uniqueness. In authoritarian and fascist regimes, military leaders, battles, and national symbols were utilized in paintings, statues, and monuments. Moreover, in socialist regimes the working class, surrounded by the implements of industry and agriculture, was a common motif to support a vision of an egalitarian ideal.

Similarly, nationalist art in colonized or semi-colonized world regions romanticized the plight of the oppressed masses in their fight for liberation, emphasizing the promise of freedom from imperialism and the hope offered by modernization. Along similar lines, the nationalist art of republics in the Americas often emphasized national narratives of “freedom and liberty,” a common theme often highlighting the importance of state institutions in the construction of the nation-state.

—Abraham O. Mendoza

Official and Nationalistic Art in Africa

Early colonial education was generally not invested in promoting the visual arts, partly because it attempted to encourage only specific utilitarian skills and because it denied the full humanity of the colonized by ignoring their potential for developing creative abilities. The scope and reach of colonialism inspired a sense of unity among Africa's nationalist liberation movements, which in turn inspired critiques of colonialism emergent in the work of artists in the first part of the twentieth century. Although influenced by the different cultural and historical influences of each region as well as by the different media and forms of artistic production, artists in Africa were inspired by the struggles of nationalist leaders and intellectuals and thus became engaged in the production of anticolonialist and nationalist art.

Many emerging artists in the early part of the twentieth century were forced to be self-taught, as the incorporation of the arts was denied in the colonial curriculum. In West Africa, Aina Onabolu became a self-taught painter whose work reflected a universal humanism and a realism evocative of both European modernist painters and the conventions of classical Ife court art that are part of his heritage.

Egypt's Wafdist movement of the 1920s and 1930s inspired new themes in the production of nationalist and revolutionary art that aimed to assert the authenticity of Egypt's distinct cultural past and to distinguish Egypt from its British occupier. In colonial Egypt, the emergent nationalist art relied on asserting a distinct historical lineage by using Pharaonic themes from Egypt's ancient past. The leaders of the modern Egyptian art movement, whether educated in Europe or in Egypt, were significantly influenced by European styles, techniques, and schools. Calling themselves *Al-Ruwwad* (pioneers), they initiated an artistic revival that collectively depicted Egypt's anticolonialist struggle and women's liberation as well as its agricultural landscape as an expression of its cultural and political resurgence and uniqueness. The prominent sculptor Mahmoud Mokhtar created statues of Egyptian peasants as

➤ SAAD ZAGHLOUL MAUSOLEUM

After the Wafdist nationalist leader Saad Zaghloul died in 1927, a political conflict ensued regarding the aesthetics of his tomb in Cairo, Egypt. The style of his mausoleum became a topic of debate in the press, centering mainly on whether the forms incorporated into its development should be religious or national. Although plans were made for a mosque or a mosquelike location where prayers could be conducted, the style of the mausoleum was eventually determined to be nationalistic. The options for the national style to be selected included the distinctly cultural and historical Pharoanic style, evocative of the ancient Pharoanic past of Egypt that predates Islam and its Arab influences, and the distinctly Islamic-Arabic style. The Pharaonic style of architecture was experiencing a revival in the 1920s but was subject to a decline shortly thereafter. Because the construction of the tomb would be a significant national decision, as its style would signal the leanings of the nationalist movement, the final decision incorporated the Pharaonic aesthetic as well as the Arab-Islamic style into a syncretic national piece commemorating Zaghloul.

—*Nahrain Al-Mousawi*

well as the elite, including one of a symbolic father figure in the nationalist movement, Saad Zaghloul, before the politician's death in 1927. Another artist, Ragheb Ayad, focused on depictions of Egypt's peasantry using various scenes from Egypt's popular life through street-level and field-level intimations, whether in the coffeehouses or in the field. Other artists were sent to other parts of Africa on artistic missions to document its distinct cultural and political life. In 1931 the diplomat and artist Mohammed Naghi went to Addis Ababa to paint the Nile sources as well as court portraits, such as that of Emperor Haile Selassie.

In South Africa, the pioneers of modernist art in the 1930s also chose classical African frameworks that displaced European influences. Ernest Mancoba was such a pioneer African modernist who was considered to have

reflected the influence of African and European modernisms within the framework of his classical African wood sculptures. Mancoba's aesthetic influenced and prefigured a generation of midcentury artists who shifted their attention from an appropriation of European modernist influences to a reworking and rearticulation of classical African forms that developed new cultural forms as well as a new alternative artistic modernism.

Political cartoons expressed the burgeoning nationalist sentiment of a variety of African countries. Starting in the mid-1940s, Akinola Lasekan was Nigeria's pioneering political cartoonist at a time of significant anticolonialist nationalism. The medium of the cartoon came from a modern European colonialist consciousness against which he created his political commentary. However, Lasekan's commitment to realist art was articulated with a deep knowledge of the ironic process and production of anticolonialist criticism in its use of both the forms and tools of the colonizers.

In the later decades, the *négritude* movement, pioneered by Leopold Senghor and Aimé Césaire in France, inspired more and more visual artists than ever before who came to be influenced by the movement's nationalist struggle for African self-determination. Decades of colonial education's curricular denial of the arts was met with African artists' nationalist affirmation of the inherent worth of what had been denied and suppressed sustainably through colonial education: African cultural and artistic consciousness.

Official and Nationalistic Art in Asia

The ubiquitous world's fairs and expositions held during the last decades of the nineteenth century and the first decades of the twentieth century provide a useful context for understanding major art phenomena that occurred in many Asian nations of the era. These international venues, designed to demonstrate the cultural authority and economic strength of a nation, were embraced by its participants as a means of aggressively asserting their rightful position in international politics. The Asian nation most dedicated to the project was Japan. The most emblematic example of Japan's ambitions can be seen in its participation in the St. Louis World's Fair of 1904. Not only was the scope of Japan's exhibit noteworthy, but the contemporary publication of seminal texts—such as Nitobe Inazo's *Bushido: The Soul of Japan* and Okakura Kakuzo's *The Ideals of the East*—touting the unique strengths of Japanese culture announced the government's ambitions for colonial ascendance in the Pacific as it laid out its justifications for such aspirations.

Taking Korea as an example, the Japanese government justified its annexation of Korea in 1910 as part of an effort to civilize a backward culture. The Meiji-era bureaucrat Nitobe Inazo vociferously spoke about how the event clearly demonstrated Japan's newly found status as a legitimate world power. Along with victory in the Russo-Japanese War (1904–1905), the annexation emboldened the Japanese government and spurred Japan to ratchet up colonizing projects in the Pacific region.

The art that was produced in Korea from 1900 to 1945 is a fascinating test case for evaluating official and nationalist art production in contemporary Asia. The binary distinction between "traditional" and "modern" art and the efforts to assert a unique national identity through artistic representation were primary issues with which artists, critics, and the governments of the era struggled. However, in Korea—as well as in Formosa (Taiwan) and many other islands in the Pacific—the artistic enterprise was further complicated by the role that the colonialist

powers played in writing the national artistic narrative.

Before Korea was annexed by Japan, Korea's penultimate king, Gojong (r. 1863–1907), had been keenly invested in making Korea's presence felt in the world. Korea's first participation was at the World's Columbian Exposition of 1893 in Chicago, to be followed by participation in the Exposition Universelle in Paris in 1900. This desire to demonstrate the nation's modernity and progress was overturned as Japan, in disciplined fashion, methodically portrayed Korea as tragically backward and mired in a calcified past. According to the Japanese, it was their role to bring Korea in step with the present, and as part of this goal, the colonial government established the Joseon Art Exhibition in 1922.

In its early years, the Joseon Art Exhibition was dominated by Japanese nationals. More than half of the artists who participated were Japanese, and the jurors were all Japanese. Korean artists' responses to the foreign control of the official institutions of art were varied. Some artists refused to participate as a means of protest, but many saw no alternative if they wanted a career in art and thus chose to dedicate their contributions to articulating not only an individual artistic vision but also nationalistic concepts concerning a unique Korean cultural aesthetic.

The pursuit of an inherent national essence was a shared goal between both the colonialist power and native Korean artists, although what that essence was exactly and how it should manifest itself in material terms was a matter of debate. An aesthetics debate emerged around 1928 over a quality called local color (*hyangtosaek*) among Korean artists and art critics and became embraced by both the colonizer and colonized. Part of the call for local color was grounded in a rejection of Western art and its traditions, while it also privileged the notion of timeless character unique to the peninsula. Thus, many called for a portrayal of the geography, climate, and scenes of Korean rural life. What was touted by nationalist Koreans as a means for proudly asserting a positive national identity was ironically also supported by the Japanese colonialist power. Imagery of pastoral scenes and customs fit the view of Korean culture favored by the Jap-

ART IN OCEANIA

Oceania consists of approximately 25,000 islands including Australia, New Guinea, Melanesia, Micronesia, and Polynesia. The diverse cultural traditions that constitute Oceania produced varied forms and concepts of art throughout centuries.

A notable late-nineteenth- and early-twentieth-century phenomenon that exerted an enormous impact upon Oceanic art production and reception was the cross-cultural contact between the islands and the European avant-garde. The role of Post-Impressionist painter Paul Gauguin (1848–1903), in particular, and the broader phenomenon of exhibiting Oceanic and African art as “primitive” art, prominent in the late 1800s and early 1900s, is seminal to the discourse of art in Oceania from 1900 to 1945.

As was the case in many non-Euro-American nations during that era, the concept of the traditional was actively redefined in the context of comparing native forms and practices as a contrast to those of Western origin. The establishment of art schools following the European model and the emergence of modern tourist art commerce had a significant impact on the development of artistic concepts and practices in Oceania.

—Susan Lee

anese government as one frozen in time, forever in a state of provincial exoticism, and therefore in need of a greater nation's guardianship for survival in the twentieth century.

The single most prominent figure in Chinese art production between 1900 and 1945 was the writer and political activist Lu Xun. In addition to his notable literary achievements, his leadership in the woodcut print movement epitomized the effective merger of political activism with promotion of avant-garde aesthetic ideals imported from Europe and Japan. Many of the themes and working methods of the prints also provided the foundation for Socialist Realist art that was to dominate Mao Zedong's People's Republic of China.

Official and Nationalistic Art in Europe

Ideological and political movements in post-World War I Europe had a significant influence on culture and the arts. Italian fascism, German national socialism, and Soviet communism permeated the cultural life of interwar Europe to a considerable degree. The construction of monuments, promenades, and buildings that glorified and celebrated the achievements of these varying ideologies were ubiquitous throughout Italy, Germany, and the Soviet Union. The nationalist cult of personality of these respective states, which focused on the image of the leader (Benito Mussolini, Adolf Hitler, and Josef Stalin) in busts, statues, and images, was also widespread. Growing state control in these totalitarian societies restricted the sort of art allowed in the public sphere and hindered artistic movements and styles that did not adhere to the party or state line.

From the 1920s through the 1940s, with fascist Italy under the control of “il Duce” Benito Mussolini, much of the state-endorsed art celebrated the achievements of the Fascist Party and the fascist state. Artistic movements, such as futurism (associated with poet and polemicist Filippo Marinetti), emphasized the social and economic advances that fascism granted to the Italian state and its people. Much of the art and architecture produced in Italy during this period focused on the glorious Roman past and the parallels with the development of a modern Roman Empire under Mussolini. Roman columns and classical motifs in buildings were quite common, as were busts and statues of fascist heroes such as Mussolini himself and Gabriele D’Annunzio. In contrast, artists critical to the fascist regime found themselves ostracized, harassed, and sometimes imprisoned if their art was found to be subversive or critical of the rule of Mussolini.

Nazi Germany (1933–1945) and its ubiquitous display of nationalist art and monuments starkly contrasted with the widespread innovations and movements in the arts that preceded it in the Weimar Republic (1919–1933). German dictator Adolf Hitler, an artist himself as a young man, was disgusted with modern art and its various forms (such as modernism, cubism, and expressionism), seeing these as decadent and promulgated by Jews. National socialism advocated art that celebrated German national life and its achievements. Nazi architecture, as designed by such luminaries as Albert Speer, included gigantic neoclassical and art deco-influenced structures that emphasized the greatness of the German state and race. Statues celebrated the Aryan human form as an ideal. Streets and promenades were decked with Nazi flags and regalia to imbue a sense of cultural uniformity and subservience among the German masses. Neoclassical stadiums and parade grounds, such as the Nuremberg rally grounds and the Sportsplatz in Berlin, were built to hold massive national socialist rallies in order to garner support for Hitler’s regime. Busts, images, and statues celebrating Adolf Hitler were prevalent in daily German life, with images of the benevolent yet authoritarian German dictator saturating the public sphere of Nazi Germany. Artists and architects were forced to abide by national socialist cultural guidelines or else

INTERNATIONAL EXPOSITION DEDICATED TO ART AND TECHNOLOGY IN MODERN LIFE, 1937

The Exposition Internationale des Arts et Techniques dans la Vie Moderne (International Exposition dedicated to Art and Technology in Modern Life) held in Paris, France, in 1937 was a showcase for the ideological exhibits of the rival nation-states of Europe. The Spanish pavilion, which was representative of the Spanish Republic and not of Franco's Nationalist Spain, included Pablo Picasso's celebrated mural *Guernica*, which was painted specifically for the exposition and depicted the atrocious nature of modern war. This choice emphasized the Spanish Republic's protest against fascist aggression by Franco's allies, Nazi Germany and fascist Italy, who were actively involved in supplying Nationalist forces with matériel and troops. Nazi Germany was represented by its pavilion, designed by notable Nazi architect Albert Speer. Speer's pavilion was focused on a 500-foot

(152-meter) tower adorned with the twin symbols of the National Socialist German state, the eagle and the swastika. The pavilion was meant to represent the greatness and pride of the German state and the restorative power of National Socialism. Immediately across from the German pavilion was the Soviet pavilion, which celebrated the achievements of the Soviet state under socialism. The Soviet monument, located at the top of the pavilion, consisted of a large stainless steel sculpture depicting a male worker and a female kolkhoz (agricultural collective) peasant with their hands holding a hammer and a sickle together as a symbol of communism atop a massive building facade. These two pavilions directly faced each other, making the exhibition a symbolic competition between the two ideological rivals.

—Abraham O. Mendoza

face incarceration in concentration camps, leading many of them to choose exile abroad. Many advocates of German modern art and architecture found refuge in places such as New York, Los Angeles, Paris, and Tel Aviv; these expatriates wielded a significant influence on the art and thought of those cities.

Cultural life in the Soviet Union was completely shaped by the ideological and political guidelines set by the Communist Party of the Soviet Union (CPSU), which emphasized the Soviet worker, government policies, and the cult of personality of CPSU general secretary Josef Stalin. The Soviet laborer, peasant, and working class in general, rendered in the heroic style of social realism, were typical motifs in Soviet art to emphasize the collective effort of socialism in creating the Soviet state. Government policies (Five-Year Plans) in industry, agriculture, and in the military were also subjects in art, as these were also seen as pivotal to building socialism. Stalin was a major motif in much of the propagandist art promulgated in the Soviet Union in

addition to the other patriarch of the socialist movement, Lenin, whose body was displayed in Moscow in an elegantly designed tomb. Architecture also focused on gigantic monuments that celebrated Soviet achievements, typically in city centers, squares, and promenades, along with statues of Stalin, Lenin, and other Soviet heroes. Much like the other totalitarian regimes, artists and intellectuals who did not follow the official party line in regard to what was deemed acceptable art often were sent to forced-labor camps and detention centers in Siberia.

Economics and Trade

A truly unified global economy emerged in the first half of the twentieth century. As the century opened, the European imperial states had developed interdependent complex economic relationships with their colonies and with each other. From 1900 to 1914 the global economy was centered in western Europe, the United States, and Japan as the major centers of world industry, with Asia, Latin America, Africa, and Oceania serving as sources of raw materials as well as markets for finished goods and services. Germany was the premier industrial nation, the center of the European economic system and its greater linkages to global trade. The economic relationships among the various societies in the British empire gave the illusion of stability. Germany, France, and Britain exported capital through development loans and investments to their imperial dominions or other developing semi-industrial states. The United States was still a net debtor nation but was beginning to develop its economic power on a global scale. The world economy underwent several transitions as the center of the international economic system shifted, as New York City became the nexus of global trade, gradually taking the mantle from the City of London.

Colonialism and neocolonialism were critical forces shaping the world's economies in this period. From 1900 to 1914 Britain, France, Germany, the United States, and Japan were the foremost economic powers. Britain in particular exerted an immense economic influence through its vast colonial dominions over much of Africa, Asia, Oceania, and North America as well as its indirect economic control of much of Latin America. Attempts to acquire economic independence, most notably in the context of the Mexican Revolution (1910–1920), proved successful in loosening the grip of European and U.S. economic domination from some Latin American countries. Despite such successes, most of the colonial world remained subject to European and American economic dominance, with some regions developing into important centers of production in their own right, such as Canada, Australia, Brazil, and Argentina. Other regions, such as the Ottoman empire and tsarist Russia, became semicolonial states, subject to foreign economic domination. During this period the United States and Japan, following their emergence in the late nineteenth century as major global economic powers, continued to expand

Attempts to acquire economic independence, most notably in the context of the Mexican Revolution (1910–1920), proved successful in loosening the grip of European and U.S. economic domination from some Latin American countries.

their economic clout. In contrast, the combination of foreign entrenchment, wars, and internal rebellion in China proved disruptive economically as well as politically.

Warfare was arguably the most critical force shaping the world's economies over this half-century period. The major belligerents learned to mobilize their economies effectively during World War I. In particular, Britain, France, and Germany had mobilized most of their economies—including capital, material resources, manufacturing capacity, and labor—for the purpose of war. These government-coordinated efforts established boards of politicians, military officers, and major businesses to draft and implement economic plans that allowed for the maximum amount of war matériel while minimizing or eliminating consumer goods for civilians. Due to naval blockades and unrestricted submarine warfare, most of the international economy was cut off from the major European ports and major sources of investment. As a result, nominally independent world regions, such as Latin America, that had relied on European investment and markets for their goods became attached to the United States during this period. The efforts of the Great Powers to obtain war materials from external colonial sources also were disrupted by blockades, setting off a desperate scramble. The Bolshevik regime in Russia, having learned from war mobilization, managed to establish a state-command economy in the areas under its control during the Russian Civil War, creating a socialist economy in the midst of the Russian Revolution. Moreover, the economic growth ignited by the war in the United States, Canada, and Australia allowed for the expansion of their respective industrial economies, encouraging vast internal migrations to industrial cities from the countryside while overseas immigration was cut off for the duration of the war. In eastern Asia, Japan was able to expand its own trade within the region, supplying European colonial possessions and China in the absence of European trade due to concessions granted for the duration of the conflict. Moreover, lessons learned while mobilizing wartime economies ended the primacy of laissez-faire economics, illustrating the value of state intervention in the economy. This lesson was not lost on individuals such as British economist John Maynard Keynes and Russian socialist revolutionary V. I. Lenin.

Following World War I, the economic boom of the 1920s reverberated through the global economy. Britain and France were able to reestablish themselves in the world economy, albeit in a relatively lesser role given the advantages gained by the United States, Canada, and Japan as well as several Latin American republics during the war. The diversified nature of the multipolar international economy was evident. Germany, shackled by reparations and foreign occupation, succumbed to rampant inflation in 1923, saved only by an infusion of American capital. Problems emerged in agriculture, as the massive amounts of foodstuffs available during this period depressed prices and allowed for massive dumping of grains abroad. Moreover, manufactured consumer goods flooded the industrialized economies, most notably the United States, and eventually saturated the markets. Risky trading practices such as buying stock on margin and illegal practices such as insider

trading led to rampant speculation by individuals and by corporations seeking to reap huge dividends and short-term profits. The vulnerability of this globally unregulated free market, mostly centered in Europe, the United States, and Japan, affected the rest of the world when the whole structure came undone in the late 1920s. Dependence on the U.S. economy led to global collapse, given that the United States had become the largest consumer as well as the largest creditor nation during the inter-war period.

The reverberations of the Great Depression of the 1930s were felt worldwide. The financial losses incurred in the world's stock exchanges dragged most of the major economies into a downward spiral. The magnitude of this international economic collapse overshadowed all prior business cycle downturns in its ramifications. On October 24, 1929, otherwise known as "Black Thursday," more than 16 million shares of stock were sold as investors panicked and sought to cut their losses. Within the next three weeks, the general industrial index of the New York Stock Exchange (NYSE) dropped by more than half. Bank runs led to the insolvency of many U.S. banks and caused them to fail, with many people losing their entire savings. The interdependence that existed between the United States and the world's economy led to the collapse of European economies as U.S. banks called in their loans, causing the world's leading banking systems to experience further insolvency and economic collapse. For example, when U.S. banks called in their loans from Germany, which depended on U.S. capital to pay its war reparations, this led to Germany's immediate economic collapse. The ensuing fall in production and prices led to massive layoffs and unemployment, with Germany experiencing a high of 6 million unemployed.

During the Great Depression many of the major world economies enacted protectionist measures, in effect cutting off international trade by creating barriers to foreign goods and privileging domestic production. Moreover, Britain went off the gold standard in 1931 and the United States did so in 1933, thereby effectively ending gold's value as the peg of the world's major currencies and thus devaluing most of the world's money supply. In contrast, the communist Soviet Union, effectively isolated and cut off from international trade, presented itself as a model for economic stability under socialism. The truth was somewhat different. Although Russia had expanded industrialization and commerce in the years following 1917, war and population growth put severe stresses on agriculture. During the Great Depression income from exports went down, but such external pressures were eclipsed by the forced collectivization of both industry and agriculture in the Soviet Union that ultimately resulted in the imprisonment of about 8 million people and the deaths of approximately 3 million more.

The Great Depression also led to the economic collapse of much of Asia and Latin America, which while not heavily industrialized were nonetheless vulnerable given their interdependence on European and

For example, when U.S. banks called in their loans from Germany, which depended on U.S. capital to pay its war reparations, this led to Germany's immediate economic collapse.

North American investments and trade. The impact of the crisis in Southeast Asia was worsened by the excess production capacity in various export commodities such as rubber, sugar, copra, tobacco, tea, rice, and tin that had occurred throughout the 1920s. By the late 1920s and with the beginning of the Great Depression in the 1930s, the price of these commodities dropped, severely affecting regional economies that depended on their sales to Europe and the United States. Bank collapses in Europe and the United States also affected Southeast Asia as international credit became more scarce. As their already miniscule profit margins vanished, many firms defaulted on loans, which ruined the region's credit rating and thus led to further collapse. Similarly, Latin American economies, which relied on the sale of raw materials to the industrialized world, also declined in their profitability and suffered as international banking systems collapsed. Countries like Mexico, Brazil, and Argentina, which relied on foreign investment and were still primarily suppliers of raw materials, were severely affected by the protectionist policies and trade barriers created by the world's industrial powers.

The global depression of the 1930s vastly recast the world's economy as major world states attempted to intervene to alleviate the worst aspects of the depression on their domestic populations, often leading to populist political revolutions amid the social chaos that ensued from the economic collapse. Keynesian economics, which built on the state-interventionist methods of the wartime economies, was used in the United States in the form of the New Deal economic policies of the 1930s to infuse the economy with capital while providing employment. In Germany after Adolf Hitler came to power in 1933, the Nazi regime infused the German economy through a program of government investment in armament production and massive public works projects in tandem with price controls and wage freezes, alleviating the worst effects of the Great Depression for the German public.

Economic protectionism contributed to the destabilization of the global economy in the form of trade policies and tariffs that were to factor into the emergence of World War II. From 1930 to 1939, with the exception of the Soviet Union, most of the world's major economies set up protective barriers at the expense of outside trade, vastly affecting international stability. The U.S. Smoot-Hawley Tariff Act of 1930, which effectively cut off international trade, set off immediate retaliation. The British set up their empire and dominions as a pound sterling bloc, privileging exports and imports from within. France followed suit, with much of continental Europe within its protectionist bloc. Germany and Japan, suffering the effects of the economic depression and viewing protectionism as a factor that worsened their own economic position, turned to warfare to carve out their protectionist blocs through the annexation of their neighbors. For example, prior to the Great Depression, the Japanese were in the process of addressing an unfavorable balance of payments to foreign states and the transition from an agrarian to an industrial economy. The Japanese took measures to cut the cost of manufactures to increase international trade and tried to strengthen the yen by returning to a gold standard. However, when agricultural prices became depressed globally, by 1930 Japanese farm income was down by at

least one-third. Japanese peasants were hit the hardest, many of them reduced to subsistence and desperate measures, such as staving off starvation by eating bark or grass and even selling their daughters into prostitution. These circumstances spurred the annexationist drive of the Japanese military establishment, which saw the acquisition of east Asian territories as a means to ameliorate the effects of economic collapse. The resultant World War II also vastly changed the global economy, as wartime production pulled the major belligerents out of the depression as their economies shifted to war production.

World War II, which started in eastern Asia in 1937 and in Europe in 1939, also led to vast changes in the global economic order. As in World War I but on a more vast scale, Britain, the Soviet Union, and the United States mobilized their national economies to effectively create a powerful war machine to defeat their Axis enemies. Collectively, the British dominions (Britain, Australia, Canada, New Zealand, and South Africa), the United States, and the Soviet Union amassed massive military formations, industrial capacity, and labor pools that outmanned and outproduced and eventually defeated the Axis Powers. Moreover, the interwar lessons of planned economies and the expansion of the welfare state (such as the New Deal legislation in the United States) served as crucial models for the Allies in their efforts of state-coordinated war mobilization at a more immense scale than that of World War I. In the end, the economic mobilization for World War II ended the Great Depression. However, the war also ended European economic hegemony. With the war having destroyed most of Europe, the U.S. Marshall Plan of 1947 was instituted to rebuild and reintegrate western Europe into the global economy as well as tie it to U.S. economic hegemony.

■ Introduction: A Global Economy

During the late nineteenth century, the international economy was in many ways more global than it is today. Most strikingly, laborers were able to move great distances in massive numbers. Peasants from places like Italy and Poland, for instance, crossed the Atlantic Ocean to the Americas by the thousands. Investors used communication technology—telegraphs and telephones—to spend huge sums of money in overseas business deals. In part, businesses were able to borrow and invest so much because London emerged as the center of world lending. London bankers operated strictly on the gold standard, which kept the value of British cur-

rency tied to the supply of gold and thus closely aligned to the country's actual financial wealth. The United Kingdom also stood at the center of a vast overseas empire that was primarily based on trade. The country's holdings across the globe were so extensive that Britons often boasted that the sun never set on the British empire. France also maintained a substantial international trading empire. The global economy of 1850–1914 greatly expanded the size and capacity of the Industrial Revolution.

The international economy went through another change between 1914 and 1945. Two world wars and a devastating economic depression led

many political leaders to clamp down on the wide-open global economy that had previously existed. Several nations abandoned the gold standard, which made it riskier for businesses to consider making overseas investments, as many national currencies were no longer tied to actual wealth. Even more extreme, some nations like Nazi Germany and the Soviet Union adopted an isolationist stance that closed off many of their trade connections with the outside world in an attempt to force their internal economies to grow.

The post-World War II era saw the rise of a host of such international institutions as the United Nations that were designed to prevent further world wars. In addition, many nations agreed to form institutions that would help nations recover from the war's devastation and spark economic growth in other countries that had fallen behind in the shift from farm-based to industry-based economies. The United States emerged from World War II with the world's strongest industrial economy, largely because very little fighting had actually occurred in the country, which left its factories and farms intact. The United States funded many of the new institutions, often with the belief that such organizations would help prevent the spread of communism around the world. In any event, the Marshall Plan, the World Bank, and the International Monetary Fund played key roles in the remarkable economic growth of western Europe, Japan, and other countries around the Pacific Rim.

—Josh Ross Ashenmiller

Keynesianism

Keynesianism reflects the body of economic thought associated with John Maynard Keynes. Most notably, Keynesianism shows how economies do not necessarily return to conditions of full employment, and how an activist government policy of increased spending and lower taxes may be necessary to end economic downturns. Keynesianism developed in response to the classical economics of the early twentieth century, which taught that short-term economic fluctuations, such as recessions, are an unavoidable part of economic life. Nonetheless, the

economy will naturally gravitate toward its full employment level and the government would only hamper this process by intervening.

But the duration and severity of the Great Depression had begun to turn these views on their head. How long would it take for the economy to correct itself? In 1936, John Maynard Keynes published *The General Theory of Employment, Interest, and Money*, which argued that it is possible for the economy to remain permanently trapped in a condition of high unemployment and economic stagnation. This can result from a loss of confidence by businesses and consumers. If businesses do not feel confident about the future and consumers are not spending, the economy's savings will not be transformed into investment projects and the economy will stagnate with few new employment opportunities. The government must step in and fill this gap in investment to provide the necessary boost to the economy. In the short term, it is acceptable for the government to borrow funds for this purpose, which can be paid back during subsequent economic expansions.

The government expenditures used to finance World War II showed the power of government spending to provide an economic stimulus. In 1940, government purchases in the United States totaled \$6.2 billion, while the total output of the economy was \$100.6 billion and 8.1 million people were unemployed. By 1945, government spending has risen to \$74.8 billion, while the total output rose to \$312.6 billion, and 1 million people were unemployed. Even after accounting for a 28 percent rise in the price level, the increased spending associated with the war provided a dramatic boost to the economy. Meanwhile, economists such as Alvin Hansen worked tirelessly to explain to Americans how the Keynesian idea of an activist government policy was a necessity to avoid lengthy economic depressions. These events eased peoples' concerns that Keynesianism was a form of socialism and helped pave the way to the Employment Act of 1946, which committed the U.S. government to pursuing a policy of full employment.

Keynesianism also played a direct role in Great Britain during World War II, as Keynes involvement with the Treasury helped to lay the

framework for Britain's financing of the war. Keynesian prescriptions included increasing taxes to discourage consumer spending and inflation, delaying income payments until after the war to provide for pent-up consumer spending desires, and lowering interest rates to stimulate investment in industries needed for war production.

Finally, Keynesianism would play a vital role in the development of the postwar international financial structure. Keynes served as Britain's representative at the Bretton Woods Conference of 1944. His ideas contributed to the creation of the International Monetary Fund and the World Bank. Essentially, he sought expanded trade between countries and believed that this would be possible through a system of stable currency exchange rates maintained through international cooperation.

John Maynard Keynes died in 1946, but the effect of his theory and policy prescriptions is still felt today. After the war, Keynesian theory underwent a number of challenges and refinements. Keynesians adapted certain points of their critics while maintaining the same underlying ideas and recommendations. Governments still use activist policies to stabilize economic fluctuations.

Economic Colonialism

For more than a century, historians, economists, and politicians have debated the impact of colonial occupation on the economies of colonizing and colonized nations in the first half of the twentieth century. To a large extent their answers were mixed and depended on the countries they examined and the assumptions they brought to their studies. In the last major colonial scramble, which lasted from around 1875 to around 1900, economic motives were loudly touted by politicians and businessmen in Britain, France, Germany, and the United States. Men such as Joseph Chamberlain (1836–1914) and Cecil Rhodes (1853–1902) in Britain, Jules Ferry (1832–1893) in France, and Theodore Roosevelt (1858–1919) in the United States promoted the material and strategic economic benefits of colonizing distant lands. Many colonies never lived up to the economic expectations of their promoters. Yet almost all studies agree that whatever the benefit of individual colonies to individual powers, the new imperialism of the late nineteenth century and the colonial scramble that accompanied it were key preconditions for the expansion of capitalism into a globally integrated system of production and exchange. Late-nineteenth-century imperialism essentially laid the groundwork for the wave of globalization that began after 1945.

Colonialism is the formal annexation and administration of a territory by an outside power and its concurrent integration into the political and economic structures of the metropolitan (colonizing) power. The colony assumes a relationship of inequality and subordination to the metropolis. The colonialism that developed in the late nineteenth century was considered by Europeans to be a new phenomenon. From 1820 to 1875 the prevailing economic doctrine of industrial capitalist Europe was one of laissez-faire at home (little government regulation of the economy) and free trade overseas. Colonies were regarded, at least officially, as economically burdensome and interfering with the benefits of free trade. During the economic depression of 1873–1896 world productive capacity exceeded demand, and economic doctrine and practice began to emphasize

Two colonists examine the rubber collected by the workers on a plantation in French Central-Equatorial Africa. (Hulton-Deutsch Collection/Corbis)

the need for tariffs to protect home markets from cheap foreign goods, for cartels and monopolies to limit production and keep prices high, and for colonies to secure exclusive access to raw materials, markets, and investment outlets overseas. The word “imperialism” entered political and popular discourse in the 1890s as the name for this new aggressive drive by the world’s major industrial powers to carve the globe up into exclusive economic preserves.

By 1900 the major capitalist powers had pulled out of their long depressions but kept their colonial possessions. By 1915 most territories outside of Europe and the Americas were under the formal political domination of a handful of states (mainly Great Britain, France, Italy, Germany, the Netherlands, Belgium, the United States, and Japan) and comprised about one-quarter of the world’s land surface. These states became more active in economic affairs both at home and in their colonies, shaping policies to benefit the metropolitan economy and aligning the colonial economy to that of the metropolis. New developments in transportation such as oceangoing steam freighters, river boats, and refrigerated ships generated interest in the development of remote colonial lands. Colonies soon specialized in exporting industrial raw materials and bulk foods: Malaya exported rubber and tin; the Congo exported rubber; Ceylon exported

tea; South Africa exported gold; Indonesia exported indigo, coffee, tea, and sugar; and India exported jute and cotton.

India was the jewel in the crown of the British empire and is one colony that turned a profit for its owners. Forty to 45 percent of British cotton exports went to India, and India remitted tens of millions of pounds sterling in annual economic surplus to Britain, which allowed Britain to maintain a favorable balance of payments from 1900 to 1945. In 1945 India was the seventh-largest industrial country by output. The general consensus among historians is that German and French colonies as a whole were net economic losses for the metropolitan economy, but certain groups did make a great deal of money out of colonial trade and investments. For instance, the *Compagnie Française de l’Afrique Occidentale* paid dividends of 26 percent in 1913. Beyond the economic proceeds remitted to the metropolis and individual corporations, the main contribution of colonialism to the development of a worldwide capitalist economy was the replacement of indigenous economic infrastructures with ones geared toward export markets (port facilities, railroads, canals, and roads) and the introduction of financial and accounting practices, legal structures, and taxation systems that facilitated colonial integration into the capitalist economy of the metropolis. These changes did little to help the internal development of the colonies since all advances were geared toward bringing mostly primary commodities to an export market. This export orientation of the colonies prepared them for integration into a global economy, but the fact that the commodities they exported were often unfinished primary goods (raw rubber, tin, cotton cloth, or bulk commodities such as sugar) left them at a competitive disadvantage vis-à-vis industrialized countries (often their former colonial occupiers) that exported higher-value finished goods in exchange.

The new colonialism was the result of an era of severe political and economic rivalry between the advanced capitalist nations of the world that lasted from 1870 to 1945. This intense rivalry also resulted in two world wars. However, the major economic result of the colonialism that matured between 1900 and 1945 is that it sowed the seeds for a post-1945 world capitalist system

► THE CONGO FREE STATE, 1903

Sir Arthur Conan Doyle (1859–1930), the author of the Sherlock Holmes stories, wrote an exposé of the ruthless economic exploitation of the indigenous people of the Congo Free State of King Leopold of Belgium (1835–1909). As Doyle wrote in his Introduction, “The Congo State was founded by the Belgian King, and exploited by Belgian capital, Belgian soldiers and Belgian concessionaires.” He cited the following account from the 1903 eyewitness reports of an English missionary named Scrivener:

“Everything was on a military basis, but, so far as I could see, the one and only reason for it all was rubber. It was the theme of every conversation, and it was evident that the only way to please one’s superiors was to increase the output somehow. . . . [The indigenous people] were told to bring in rubber. This was quite a new thing for them to do. There was rubber in the forest several days away from their home, but that it was worth anything was news to them. A small reward was offered, and a rush was made for the rubber; ‘What strange white men, to give us cloth and beads for the sap of a wild vine.’ They rejoiced in what they thought was their good fortune. But soon the reward was

reduced until they were told to bring in the rubber for nothing. To this they tried to demur, but to their great surprise several [indigenous people] were shot by the soldiers, and the rest were told, with many curses and blows, to go at once or more would be killed. Terrified, they began to prepare their food for the fortnight’s absence from the village, which the collection of the rubber entailed. The soldiers discovered them sitting about. ‘What, not gone yet?’ Bang! bang! bang! bang! And down fell one and another, dead, in the midst of wives and companions. There is a terrible wail, and an attempt made to prepare the dead for burial, but this is not allowed. All must go at once to the forest. And the poor wretches had to go, without even their tinderboxes to make fires. Many died in the forests from exposure and hunger, and still more from the rifles of the ferocious soldiers in charge of the post. In spite of all their efforts, the amount [of rubber collected] fell off, and more and more [indigenous people] were killed.”

managed by the United States. Colonialism weakened and in some cases eradicated precapitalist modes of production and exchange in the colonies, replacing them with economies that meshed better with industrial capitalist economies. When the United States emerged from World War II as the richest and most powerful nation in the world, it embarked on an economic strategy that looked to the elimination of colonial trading blocs and protectionist measures that would impede the flow of American goods and capital around the world. Former colonial rivals had exhausted themselves in two world wars, and the threat of the Soviet power in 1945 created a community of interest between them and the United States. Even though postwar American anticolonialism was seen by many Europeans as an economic imperialism of the free-trade variety, it set the stage for rapid decolonization and

for the global integration of the economic resources and assets of colonizer and colonized in the Bretton Woods system.

Monopolies and Oligopolies

In the late nineteenth and early twentieth centuries, powerful monopolies and oligopolies became common economic fixtures throughout

Female foreign workers from the Stadelheim prison work in a factory owned by the Agfa Camera Company in May 1943. Agfa was part of I.G. Farben, which faced trial for war crimes at the end of World War II. (United States Holocaust Memorial Museum)

the capitalist world. These enterprises or collaborations allowed specific corporations to secure control of markets, maximize profits, and limit or stamp out the competition. Monopolies (sole providers of a product or service in a particular market) and oligopolies (small group of sellers, also known as a pool, working in collaboration to dominate a market) existed in various forms and entities throughout much of the West, such as pools in the United States (U.S. Steel, Standard Oil, and U.S. Tobacco), cartels in Germany (Siemens, I. G. Farben, and Hugo Stinnes' business empire), and the *zaibatsu* in Japan (Mitsui, Mitsubishi, and Sumitomo). These business entities had considerable control over internal politics and social developments given their scope and power during this period. Monopolies also held sway in colonialist endeavors abroad, most typified by the British domination of Middle Eastern oil in Iraq and Persia (present-day Iran) through the Anglo-Persian Oil Company, which had a considerable influence on the internal politics of those emergent states as well as on British foreign policy.

Known to posterity as the trust buster, President Theodore Roosevelt (in office from 1901–1909) combated the monopolies, oligopolies, and pools that had near free rein over U.S. indus-

try and domestic markets. Companies such as Andrew Carnegie's U.S. Steel and John D. Rockefeller's Standard Oil cornered the market in their respective industries but also among related subsidiary industries that often included railroads and shipping. This resulted in their domination of pricing, domestic output, and markets and the marginalizing and elimination of competitors. While antitrust legislation did put an end to some of these unethical practices in the first decade of the twentieth century, many of the coercive tactics of these monolithic entities continued in subsequent decades, often supported by conservative business interests.

Interwar Weimar Germany, fraught with political discord and economic collapse, created the perfect opportunity for industrialist Hugo Stinnes (1870–1924) to amass a large business conglomerate concern that included mines, foundries, shipping lines, paper mills, and banks, among other companies. From 1920 to 1924 Stinnes, as the founder of the German People's Party, held considerable sway in political developments in the Weimar Republic, which allowed him to pursue his accumulation of multiple enterprises. Other such cartels, including the industrial concern Siemens and chemical giant I. G. Farben, also cornered their respective markets in Germany during both the Weimar (1919–1933) and Nazi (1933–1945) periods. Many business leaders supported the emergence of National Socialism, given the stability that it promised amid the revolutionary discord (as evidenced in the widespread popularity of anticapitalist social democratic and communist movements) that characterized Weimar Germany in the early years of the Great Depression. They also supported Adolf Hitler's massive expansion of the military, as it created large orders and hence increased business for their interests.

Imperial Japan also maintained large-scale monopolistic entities, known as *zaibatsu*, that were family-owned interests that dominated particular economic sectors. More specifically, the *zaibatsu* were vast family-controlled monopolies that consisted of a high-level holding company, a banking subsidiary to provide finance, and several industrial subsidiaries dominating varying sectors of a market, often through other subsidiaries. Among the largest and most influential of the *zai-*

► MONOPOLIES AND WAR: I.G. FARBEN AND AUSCHWITZ-BIRKENAU

The vast chemical cartel I.G. Farben, along with its pharmaceutical subsidiary Bayer, held a large complex adjacent to the concentration and death camps located at Auschwitz-Birkenau in German-occupied Poland during World War II. Under the auspices of the national socialist Third Reich and the police empire of the Schutzstaffel (Protective Squadron, or SS), I.G. Farben relied on forced labor from the camps. Starving Jewish prisoners, surviving on meager rations and suffering widespread abuse by SS guards and Polish supervisors, often worked themselves to death. Many experiments deemed necessary to the production of weapons and medicine were tested on Jewish victims, already condemned to death. Bayer

experimented with new, potentially fatal drugs on many Jewish prisoners, often leading to their deaths. Many other business concerns in the Third Reich exploited and utilized slave labor, which allowed them to make huge profits as they supplied the products and machinery of war for the Nazi regime. Such companies as Bayern Auto Werks (BMW) also profited from slave labor conscripted from abroad (such as French workers or Russian POWs) in Nazi-dominated Europe. At war's end many major German cartels were split up and some of their leaders prosecuted for war crimes, but other companies remained unscathed and have continued to prosper.

—Abraham O. Mendoza

batsu of this period are Mitsubishi, Mitsui, and Sumitomo. Much like the cartels of Nazi Germany, the zaibatsu were intimately linked with the military cabal in power and willfully supported aggressive colonialism in East and Southeast Asia to secure sources of raw materials and markets in the Greater East Asia Co-Prosperity Sphere.

The Anglo-Persian Oil Company (APOC) was founded in 1908 following the discovery of a large oil field in Persia (Iran) by British surveyors. It is significant because it was the first multinational monopoly that exploited the oil reserves of the Middle East. Prior to the onset of World War I, First Lord of the Admiralty Winston Churchill made the decision to switch from coal fuel to oil for the Royal Navy, making APOC pivotal to British influence in the region. After the concession of Iraq as a mandate upon the dissolution of the Ottoman empire at the end of World War I, British attempts to secure the rights to oil fields in Mosul drove British foreign policy in the region to the detriment of local Iraqi leaders. This led to increased resentment in the region, sparking Iranian and Iraqi nationalism against British and later U.S. influence in the Middle East.

War Reparations

The concept and practice of reparations, in which the victors of a war demand payment from opponents for costs and losses incurred in warfare, extends back to the ancient world. The most significant reparation episode of the twentieth century followed World War I, as Germany, with its faltering economy, defaulted on payments and thus added to the downward economic spiral of the 1930s. An earlier episode of war reparations during the twentieth century included China paying reparations as indemnification for damage caused during the Boxer Rebellion (1900). Likewise, at the conclusion of the Russo-Japanese War (1904–1905), victorious Japan sought reparations from Russia, but the United States, which had mediated the resolution of the conflict, prevented it.

Due to the immense material and human costs of World War I, the victors sought reparations. Germany made the first harsh demands for financial indemnification as part of the Treaty of Brest-Litovsk that the Central Powers

➤ GERMAN REPARATIONS

Through most of the twentieth century it was accepted canon that the high reparations demands that the Allies placed on the defeated Germans after World War I was a key cause of World War II. In *The Economic Consequences of Peace* (1919), British economist and Paris peace delegate John Maynard Keynes argued that the reparations placed on Germany would ruin the entire global economy. Instead, he called for debt forgiveness and for a massive U.S. investment effort to revive the war-ravaged European economy, an idea that was in principle similar to the Marshall Plan that the United States implemented after World War II. In the last 20 years, revisionist historians such as Niall Ferguson have questioned Keynes's analysis. They call attention to the fact that Keynes dismissed the extent to which fiscal mismanagement in Germany led to the inflation crisis of the early 1920s and the fact that the victorious powers suffered greater economic consequences from World War I than did Germany. Instead of portraying Keynes as a prophet as earlier historians had done, revisionists see his arguments as having abetted the false claim that reparations were harsh and excessive.

—Gregory J. Dehler

negotiated with Russia in 1918. This treaty, however, was voided later that year at the war's conclusion. Following the defeat of the Central Powers, the victorious Allies took their turn at demanding reparations. Belgium and France wanted Germany to pay for the destruction to their territory and economy and for the loss of life caused by the kaiser's war of aggression. At the same time, Britain viewed reparations as a means to prevent a resurrection of German dominance on the continent. Reparations were also imposed on Austria, Hungary, and Bulgaria. Turkey was the lone Central power belligerent to escape reparations. In 1921, it was finally settled that German reparations would total \$33 billion, with payment being made in cash, manufactured goods, and natural resources, most importantly coal. When Germany failed to make payments in 1923, the French Army occupied

the coal mines of the Ruhr Valley. As the British economist John Maynard Keynes had predicted, the German reparations proved excessive, with far-reaching economic and political consequences. Instead of raising taxes, the Weimar government followed a fiscal policy of running huge budget deficits that ushered in a period of hyperinflation.

Across the Atlantic, American bankers worried about the stability of the entire international financial system. The Allied nations owed \$12 billion in war loans, and they could not meet their obligations unless they received timely reparations payments from Germany. In 1924 under the provisions of the Dawes Plan, the payment schedule was restructured for both war debts and reparations. Furthermore, American bankers stabilized the German currency with a significant loan that was also used to make reparations payments. In the 1920s, this system worked well toward restoring the international economy but came to a crashing halt with the Great Depression. As the American banks fell, they dragged down those in Europe. In 1931, President Herbert Hoover placed a moratorium on war debt and reparations payments. Although reparations had been reduced in 1929, Germany still defaulted in 1932. In total, Germany paid \$16.8 billion toward reparations and defaulted on \$44.7 billion in loans granted under the Dawes Plan and subsequent agreements.

Due to the lessons of World War I, the United States and Great Britain decided not to demand any form of indemnification from Germany following World War II. At the 1945 Potsdam Conference, it was agreed that the Soviets would receive reparations from the Axis Powers in the form of cash, industrial machinery, heavy equipment, and other assets, although no reparations were paid by West Germany. The 1952 Treaty of San Francisco obligated Japan to pay reparations for its acts of aggression in the Pacific and Asia, although the United States did not accept reparations. Instead, as with the Marshall Plan for Europe, the United States chose to actively stimulate economic recovery.

■ Introduction: The Great Depression

The Great Depression of the interwar period had major international economic, social, and political consequences. It not only unraveled the transnational linkages of the global economy and thus illustrated the growing dependency of all world regions on each other for economic prosperity but also unleashed protectionist policies by the world's major economic powers that contributed to the development of authoritarian movements internationally. In the core industrial and financial centers of Europe and North America, the Depression contributed to unemployment of millions as production halted and prices skyrocketed, thus shaking the political and social foundations of society and making political alternatives on the extremes, notably fascism and communism, much more attractive. In the peripheral regions of the global economy in Africa, Asia, and Latin America, which served as centers for the extraction of raw materials and as markets for the industrialized core regions, their vulnerability as nondiversified economies was exacerbated by the global economic collapse, thereby fueling already emergent nationalist sentiment and resentment toward foreign domination. The Soviet Union, built on the ruins of the tsarist empire, suffered little during the Great Depression amid the rapid industrialization under Stalinism while nevertheless suffering the violent excesses of an oppressive police state. While the Great Depression was not the cause of World War II, it did create the circumstances for the emergence and popularity of fascism in Europe and of Japanese aggression in Asia.

—Abraham O. Mendoza

Causes of the Great Depression

The depth, length, and international scope of the Great Depression are historically unique. Although economists and other scholars have struggled since that time to explain the event, a variety of explanations of the Great Depression were put forward during the period. Some argued that the Great Depression was the final crisis of capitalism, reflecting the fact that productive capability had outstripped consumption. Others suggested that the problem was a worsening income distribution that limited the market for mass-produced goods. Still others pointed to collusive practices in some sectors of the economy that encouraged firms to reduce output. And there also were suggestions that the problem lay in limited technological innovation or perhaps limited entrepreneurial zeal. Contemporary historians have continued these debates.

The ideas of John Maynard Keynes on state intervention in the economy remain influential into the present. (Library of Congress)

➤ TECHNOLOGICAL INNOVATION DURING THE DEPRESSION

The Second Industrial Revolution of the late nineteenth century had three key elements: developments in the generation and transmission of electricity, invention of the internal combustion engine, and the improved understanding of chemical reactions. Each of these yielded major innovations in process technology that had their greatest impact during the interwar period: the assembly line was developed in the automobile industry just before World War I, chemical engineers developed continuous processing at about the same time, and the price of electricity fell dramatically through the 1910s and 1920s.

These three elements of the Second Industrial Revolution also yielded new products that became items of mass consumption—the automobile, the radio, and rayon—and stimulated hiring in the early 1920s. Following a gap in such innovations, more complex new products—the airplane, television, and nylon—were developed in each case in the late 1930s. The Great Depression may thus to some extent reflect this gap in the development of new industries.

—Rick Szostak

Mainstream economic theory of the time could not explain the Great Depression, for it predicted that economies would quickly return to full employment. Many economists found themselves in the unfortunate position of advocating government borrowing and spending, even though their theory supported a policy of balanced budgets. This situation began to change with the publication of John Maynard Keynes's *General Theory of Employment* in 1936. While some economists had explored business cycles before Keynes, he was the first to posit a theory that suggested that economies might deviate from full employment for lengthy periods of time. The postwar development of a recognized field of macroeconomics focused upon business cycles owes much to both the experience of the Great Depression and the work of Keynes.

Keynes argued that economies would enter a recession, or even a depression, if either desired investment expenditure or desired con-

sumption expenditure fell. In the early postwar period economists tended to assume that this was why the Great Depression had occurred but devoted little attention to asking why desired consumption and/or investment would have fallen far and fast enough to cause the economic downturn. In the 1960s Milton Friedman and Anna Schwartz developed an alternative explanation: that the problem was a decrease in the money supply, which had caused output to fall. Decades of detailed empirical analysis of these competing hypotheses followed and led to the general conclusion that neither of these explanations nor even both in concert could adequately explain the Great Depression.

Recent research by economists has tended to emphasize refinements to the monetary approach. One suggestion is that decreases in the money supply caused banks to reduce their lending, which in turn discouraged investment. Another approach points to the worldwide gold standard in existence at the start of the Great Depression. It is suggested that many countries in trying to maintain the value of their currency relative to gold were forced to pursue contractionary policies. While some economists celebrate one or the other as *the* explanation, the empirical evidence in their support remains equivocal. It is possible that some of the popularity of these explanations is due to the fact that they locate the blame for the Great Depression not in the market system itself but in failures of certain institutions, whether the Federal Reserve Board of the United States or the gold standard itself. Notably, the stock market crash of October 1929 is generally viewed by economists as a result of the same forces that caused the Great Depression or even a result of the onset of the depression itself much more than an independent cause of the depression.

Some economists and many historians pursue nonmacroeconomic explanations. The most common of these involves the time path of technological innovation. The interwar period was highly unusual in this respect. The spread of the assembly line, electrification, and continuous processing (by which outputs such as gasoline were produced via continual chemical reactions rather than one batch at a time) led to massive advances in worker productivity. There were

virtually no technological innovations that resulted in new products, as opposed to new productive processes, in the decade after 1925. Thus, it can be argued that workers who lost their jobs because of improvements in production technology had nowhere to go. The absence of new products also limited opportunities for investment, and the observed decline in bank loans rather than conservative bank practices might reflect this fact.

There has been an increased recognition in recent decades that the explanations outlined above are potentially complementary. Given the uniqueness of the Great Depression, it may well be that it resulted not from one cause but from interactions among more than one of the causal processes discussed above.

The Great Depression in Sub-Saharan Africa

The Great Depression severely affected Africa, most of which had been under European colonial rule since the late nineteenth century. Africa's economies depended on the sale of crops and minerals to Europe, and when prices for these commodities collapsed after 1929, Africa's economies went into a downward spiral. Africans who produced cash crops suffered as their incomes plummeted and poverty spread. In order to bolster their earnings, some African farmers increased their production of cash crops, but this diverted them from subsistence agriculture. In areas where subsistence production was deemphasized, the risk of famine increased, especially in times of drought. Many small farmers migrated to cities in search of greater opportuni-

ties between 1929 and 1934, ushering in a new period of urbanization in Africa.

The Great Depression eroded the standard of living in Africa in many ways. When prices for the continent's exports fell, tax revenues declined, creating financial deficits for colonial administrations. Government officials reacted by cutting expenditures significantly. They reduced the size of their civil services and spent far less on African health and education. They reacted to the collapse of commodity prices by trying to increase production, often by forcing Africans to cultivate more cash crops. European-run firms in Africa cut jobs and wages, banks closed, and many small businesses went bankrupt. Wage labor in Africa contracted by 50 percent between 1931 and 1934. The number of strikes by African workers rose during this period as employees resisted retrenchments and lower wages.

In West Africa, prices for commodities fell sharply during the Great Depression. In areas under French control, officials responded by seeking to increase output. The French administration in Senegal pressured Africans to cultivate more peanuts, mandated when harvests should begin, and determined when crops could be sold. French officials in the Côte d'Ivoire and Cameroon implemented forced-labor projects to increase the production of coffee and cocoa. Forced labor exacted a heavy toll on Africans; for example, in Niger forced labor on railroads and plantations, combined with a famine and a plague of locusts, caused high mortality rates in the early 1930s. In order to escape such harsh conditions in the rural areas, many Africans in French West Africa migrated to cities such as Dakar, Abidjan, Conakry, and Ouagadougou, where wage labor opportunities were scarce. Like their French counterparts, British-controlled Nigeria and the Gold Coast also experienced hardships from falling commodity prices.

The Great Depression struck with particular force in Central Africa. In the Belgian Congo, the value of exports fell by almost two-thirds in the early 1930s. Many African farmers could not afford to pay their taxes in currency, so they were required to perform labor under government supervision. Poverty in some areas was so severe that farmers could no longer afford basic necessities for their families. In addition, conditions for

African miners in the Belgian Congo also deteriorated. When the value of copper exports plummeted in the early 1930s, Belgian-owned mines reduced their workforce by almost 75 percent, causing widespread unrest among African miners in the affected areas. Strikes and riots occurred at several mines in 1931, fueled by miners, construction workers, bricklayers, and carpenters who boycotted mining company stores on the grounds that they were overcharging workers.

Prices for East Africa's commodities, particularly sisal, coffee, cotton, maize, and hides, fell sharply during the Great Depression. In Tanganyika, the British administration pressured African chiefs to increase their villages' production of cash crops, especially cotton, to compensate for the decline in prices. Other Africans stopped producing cash crops entirely in an attempt to withdraw from the European-dominated economy. In Kenya, the value of exports fell by half between 1931 and 1934, causing severe losses to growers of coffee and pyrethrum. Profits for Uganda's coffee, cotton, sugar, tobacco, and tea producers declined as well.

In southern Africa, most farming and mining operations faced shrinking profits. Mozambique's key cash crops included sisal, sugar, and groundnuts, and when the value of the territory's exports fell by half between 1929 and 1933, Portuguese authorities tried to compensate by increasing output through forced-labor projects. In British-controlled northern Rhodesia, the price of copper fell during the Great Depression, forcing mines to reduce their workforce or close altogether. Nyasaland suffered when the price of tobacco fell, reducing African income and jobs. The economic situation in southern Rhodesia was more complex. Although demand for that colony's crops—chiefly maize, tobacco, and dairy products—fell, officials there assisted white farmers by providing loans and price supports and protected them from competition by restricting African land ownership. Southern Rhodesia's asbestos and chrome mines fared poorly during the Great Depression, but gold mining became more profitable.

South Africa, the continent's economic giant, was not as hard hit by the Great Depression as the rest of sub-Saharan Africa. To be sure, both black and white farmers suffered as the

country's agriculture prices fell in the early 1930s. Wages paid to black South African farm laborers were too low to provide an adequate standard of living, and the number of so-called poor whites in South Africa multiplied, particularly in the countryside. But even though prices for South Africa's crops fell, the gold price remained fixed until 1933, when it rose by almost 50 percent. As the price of gold rose, South Africa's mining companies enjoyed higher profits and employed more workers. The expansion of gold mining stimulated growth in other industries, such as machinery, electrical equipment, explosives, cables, cement, coal, railroads, and banking. The gold mining industry bolstered government revenues through taxation and royalties, and by the end of the 1930s gold accounted for more than 70 percent of South Africa's total exports. In short, gold mining kept the entire South African economy afloat.

By the mid-1930s, the worst of the Great Depression was over in most of Africa. The continent's commodity prices began to rise in 1935, although in some areas, such as British West Africa, economic life only fully recovered in the 1940s. Urbanization in Africa, partly stimulated by the Great Depression, would also accelerate in the 1940s, especially in cities such as Dakar, Lagos, and Nairobi. Economic dislocation resulting from the Great Depression caused many Africans to view their colonial rulers more critically. But as severe as the economic depression was, it did not seriously threaten colonial rule. African nationalism would only intensify after another crisis—World War II—engulfed the globe.

The Great Depression in Southeast Asia

The Great Depression, which began with the crash of the U.S. stock market in October 1929, subsequently affected the fabric of Southeast Asian life throughout the 1930s. Since the nineteenth century, Southeast Asian economies in Burma, Thailand, French Indochina, Malaya, Dutch East Indies, and the Philippines were linked to international markets through the production and export of raw materials and food. While the region had weathered previous economic downturns, the Great Depression was unprecedented and compromised the dependent economies of these states, which relied upon export production. The policies of colonial and indigenous regimes influenced the intensity of the crisis and peasant response.

The impact of the Great Depression was exacerbated by protectionist policies, overproduction, and a steep fall in commodity prices. As the world reeled under the economic downturn, countries enacted protectionist policies designed to preserve their national economies. For Southeast Asian states, this limited their opportunities to sell goods on the world market. Limiting access to the home country meant that those colonies with ties to more robust economies fared better. For example, the Philippines' sugar industry suffered less due to preferential access to the protected U.S. market, where by contrast the Dutch East Indies' sugar and rubber industries, tied to the Netherlands' much smaller market, suffered heavily. Javanese sugar exports fell by 66 percent between 1928 and 1936, while earnings amounted to only 10 percent of predepression levels.

Encouragement from colonial regimes to increase production of export commodities such as rubber, sugar, tobacco, abaca, and tin led to overproduction by 1928. In addition, Southeast Asian states achieved record production levels with new high-yield plant varieties and more efficient industry. However, once the economic crisis hit, the prices for export products fell immediately and continued to plunge during the early 1930s. In Malaya, for example, the value of rubber and tin exports together fell nearly 80 percent from 319 million Straits Dollars (cur-

rency used in British colonies in Malaya) in 1928 to 68 million Straits Dollars in 1932.

Responding to the precipitous decline in revenue, colonial regimes borrowed heavily and reduced budgets, usually by reducing government employment. The Malayan Civil Service cut back from 270 officials in 1929 to 213 in 1935. Additional recruitment was suspended, and the salaries of those remaining officials were reduced by as much as 25 percent. European employees of companies faced similar consequences. Significant retrenchment in personnel occurred on plantations throughout Southeast Asia. Many of the newly unemployed Europeans were sent home or were given minimal financial support. Colonial authorities feared that large numbers of unemployed Europeans would damage western prestige.

Indigenous employees of colonial bureaucracies and export industries also faced reduced salaries and unemployment. In some cases, they were unable to find equivalent positions and were forced to accept lesser positions or return to the countryside. While those who remained in their jobs or accepted lesser positions saw a decrease in their salaries, they still experienced an increase in their standard of living, as retail prices were falling faster than wages. A Filipino civil servant, for example, saw a doubling of real income between 1929 and 1932.

Foreign laborers employed on plantations and in mines were the most vulnerable to the economic retrenchment. Export industries were increasingly unable to find markets as the effects of the Great Depression intensified. Initial efforts to reduce production costs by lowering wages and cutting workforce were insufficient. By 1932, many labor-intensive plantations and mines were forced to shut down. Hundreds of thousands of foreign laborers were now unemployed and unwanted in the Southeast Asian colonies. In Malaya, 250,000 Indian and Chinese rubber plantation workers and tin miners were repatriated by the government between 1930 and 1932.

Small peasant farmers also experienced severe hardships, which led to peasant resistance. The severity of the situation for small peasant landholders depended to a great extent on the policies of the colonial regime. In Burma and

French Indochina, the government insisted on collecting existing taxes in cash. In Lower Burma, the government taxes, high land rents, and falling rice prices combined to spark the Saya San Rebellion in late 1930. The proximate cause of the rebellion was the impending collection of the poll tax. The government had refused to remit the tax and moneylenders refused to advance money to the peasants before the winter rice harvest to pay the poll tax. Saya San, the rebellion's leader, promised a new kingdom where no taxes would be collected. His rebellion lasted two years and ended with his capture and execution by British Burmese authorities. Throughout the rebellion, rice exports from Lower Burma remained high although their value plummeted. While it might be surprising that peasants continued to produce rice in this context, they had no alternative. Peasants still had to pay the government taxes and continue to service debts and thus could not withdraw from rice production and the export economy.

While economic distress and strict government enforcement of tax collection prompted rebellion in some parts of Southeast Asia, more benevolent policies ameliorated the harshness of the Great Depression for other peasant populations. In the Philippines, the protected American market was open to Philippine export products. Furthermore, colonial officials were lax in tax collection. As a result, no major uprisings occurred. Filipino peasants instead resorted to previously developed coping strategies. As export commodity prices fell, peasants shifted to subsistence cropping. This was possible due to the government's willingness to permit peasants to default on their taxes. In addition, Filipino peasants reduced expenditures on unnecessary or leisure activities and postponed noncritical expenses.

The severity of the economic crisis and the slow recovery of the 1930s prompted colonial regimes to accept the need for economic diversity, shifting from their focus on raw materials and food to developing an industrial base. The Great Depression and some colonial governments' repressive policies spurred the growth of nationalist movements. Nationalists increasingly looked to new ideas and influences, especially

Marxism, to understand and critique imperialist rule, which had failed so spectacularly.

The Great Depression in the Soviet Union

Although the Soviet Union did not experience the Great Depression as did most great powers, throughout the 1930s its history was dominated by Stalin's so-called revolution from above, a colossal effort to transform the Soviet economy and to prove socialism as superior and more humane than capitalism. Already in 1928 Stalin had announced his ambitious First Five-Year Plan for rapid industrialization, and at the time of the Wall Street Crash in 1929 the Soviet Union was embarking on the large-scale collectivization of agriculture. As capitalist powers sought to recover from the Great Depression throughout the 1930s, the Soviet Union sought to build socialism in one country, a process that included not only industrial advancement but famine and terror as well.

By the late 1920s the Soviet Communist Party had committed to catch and overtake the capitalist world through the mechanism of a scientifically planned economy. To do so would be no small feat. The Soviet Union lacked much of the technology already employed in industrially advanced states and the hard currency needed

to buy industrial machinery from the capitalist West. The Soviet population remained overwhelmingly rural, and in the 1920s the Scissors Crisis exemplified the divide between city and country: because the prices of consumer goods were high and agricultural products were low, peasants had refused to supply the state with an agricultural surplus that could adequately feed urban populations.

Stalin's First and Second Five-Year plans, during 1928–1932 and 1933–1937, respectively, demanded the vast expansion of Soviet industry and the fulfillment of artificially high production goals. In the course of the First Five-Year Plan alone (which was said to have been accomplished in only four years and three months), more than 1,500 new factories were built, and industrial output nearly doubled. The greatest successes of both Five-Year plans were achieved in the realm of heavy industry and with the help of foreign engineering firms whose domestic business had suffered from the Great Depression. Yet such success came at a high price for peasants, whom Stalin sought to make responsible for financing industrialization.

In late 1929 Stalin decided that industrial goals could only be met if peasants paid the state tribute in the form of grain and other agricultural products. The full collectivization of agriculture, he argued, would allow such tribute to be collected and would further aid in eradicating peasant cultural backwardness and in merging the proletariat and peasantry in socialist unity. In early 1930 brigades of urban communists and workers descended on the countryside to requisition grain and orchestrate collectivization by force. Prosperous peasants, or kulaks, were deemed class enemies and were deported to concentration camps in Siberia and Central Asia. Resistance to collectivization was fierce: many peasants slaughtered livestock, destroyed harvests, attacked collectivizers, or fled the countryside. In March, Stalin announced that collectivization should proceed voluntarily and not by force and blamed all failures on collectivizers' excessive enthusiasm. The damage, however, had already been done. Agricultural output suffered, and collectivization contributed to deadly famines in 1932–1933.

In 1934 Stalin used the assassination of Sergei Kirov, a Communist Party leader in Leningrad, as the basis for commencing four years of state-sponsored terror known as the Great Purge. While the purges were directed in part at the Communist Party and the Red Army, millions of people unaffiliated with either institution were declared enemies of the people and were sent to labor camps or executed. An estimated 8 million people were arrested. In the midst of this terror, the 1936 Stalin Constitution was propagandized as the most democratic in the world.

For Stalin and his sympathizers in the 1930s, the Great Depression had revealed the fatal weaknesses of capitalism, while the successes of his Five-Year Plans and the creation of the concept of socialism in one country had confirmed the triumph of the Soviet system. For Stalin's detractors at home and abroad, forced collectivization and terror had shown the moral bankruptcy of the Soviet government.

The Great Depression in Western Europe

Despite the unevenness of the economic impact of the Great Depression of 1929–1939 on western Europe, it inaugurated the most intense economic, political, and social crisis that this region, the birthplace of modern capitalism, had experienced in more than 400 years. As a result of the Great Depression, millions of workers lost their

The Great Depression had an enormous impact on the German economy, leading to unemployment and massive inflation. This table indicates, for example, that in 1932, German construction workers were working only 1/3 the hours that they had been in 1928.

Source: Lölhöff, M. v. (1974). "Zeitreihen für den Arbeitsmarkt—Lohnsatz, Beschäftigungsfälle, Arbeitskosten und Arbeitsstunden (1925 bis 1938 und 1950 bis 1967)," IFO-Studien 20 (1/2), 33-150.

jobs, millions of farmers lost their land, millions of businesses folded, and every government in the region (with the exception of Mussolini's fascist Italy) changed its composition. The economic onslaught of the Great Depression left a changed western Europe in its wake. It pushed countries to initiate increasingly nationalistic policies and led directly to the greatest armed conflict in world history, World War II.

Western Europe included the countries of Portugal, Spain, France, Great Britain, Ireland, Belgium, the Netherlands, Italy, Switzerland, and Germany. In the worst-affected country, Germany, one in five adults was unemployed in 1932, and industrial output fell by 40 percent from 1929. At the Great Depression's nadir, levels of European trade fell to 33 percent of its 1929 value, and currencies were near collapse. While many countries had recovered from the worst of

the Depression by 1937, a renewed recession in 1937 showed that recovery was neither complete nor sustainable. It took military rearmament and the enormous government expenditures and deficit spending of World War II to end the Great Depression in western Europe.

The stock market crash on Wall Street in October 1929 is usually taken as the start of the Great Depression, but historians now agree that business and agriculture were in trouble long before the crash. The stock market crash has more symbolic than real value as a cause of the Great Depression in western Europe. First, signs of economic crisis (declining output and investment) were present in Germany and western Europe in 1928. Second, fear of recreating the hyperinflation of 1923, which destroyed middle-class savings, meant that in the first years of the Great Depression politicians worked to balance

budgets, cut spending, and stay on the gold standard, all of which only made economic problems worse by weakening already falling demand and limiting credit and the expansion of the money supply. It was these national policies that signaled the 1928–1929 onset of economic recession and ushered in the modern world's most severe economic depression to date.

The consensus among historians is that the wave of Austrian and German bank failures in May and July 1931 was the turning point of the Great Depression: it destroyed any hope among politicians and economists that their previous policies would end the economic crisis and forced them to deploy new policies and step up government intervention. As production and prices in industry and agriculture fell in the face of overproduction and declining investment, all European nations except Britain turned to nationalist policies such as tariffs, quotas, and other price supports to prevent complete economic collapse.

In Britain the widening economic crisis and worsening balance of payments led policymakers to abandon the gold standard in September 1931 and, with the depreciation of the pound sterling by 30 percent relative to countries still on the gold standard, the British economy began to grow as British exports became cheaper and the government began to print more money, run budget deficits, and establish public works projects to increase demand. By 1934 production was higher than in 1929, and housing construction boomed. Unemployment fell by 30 percent by 1938. The pound's depreciation was an indirect form of protectionism because imports from countries still on the gold standard (such as France, Belgium, and the United States) were now more expensive. To pursue their own national interests other countries soon followed the British example, with France finally leaving the gold standard in 1936.

The Great Depression hit western Europe at different times: it was most severe in Germany in early 1932, while Belgium hit bottom in 1935 and France in 1936. In all of the countries of western Europe except the Italian police state, the impact of the Great Depression changed the political landscape. The main impetus to change was social unrest associated with prolonged job-

➤ GEORGE ORWELL ON THE PSYCHOLOGY OF UNEMPLOYMENT

"When I first saw unemployed men at close quarters, the thing that horrified and amazed me was to find that many of them were *ashamed* of being unemployed. I was very ignorant, but not so ignorant as to imagine that when the loss of foreign markets pushed two million men out of work, those two million are any more to blame than the people who draw blanks in the Calcutta Sweep. . . . The middle classes were still talking about 'lazy idle loafers on the dole' and saying that 'these men could find work if they wanted to', and naturally these opinions percolated to the working class themselves. I remember the shock of astonishment it gave me, when I first mingled with tramps and beggars, to find that a fair proportion, perhaps a quarter, of these beings whom I had been taught to regard as cynical parasites, were decent young miners and cotton-workers gazing at their destiny with the same sort of dumb amazement as an animal in a trap. They simply could not understand what was happening to them. They had been brought up to work, and behold! it seemed like they were never going to have the chance of working again. In their circumstances it was inevitable, at first, that they should be haunted by a feeling of personal degradation. That was the attitude towards unemployment in those days: it was a disaster that happened to *you* as an individual and for which *you* were to blame."

—Alexander M. Zukas

lessness and the failure of policies to alleviate the crisis and its consequences. For example, unemployment in Britain went from 10.4 percent of the total workforce in 1929 to 22.1 percent in 1932, and in Germany it went from 13.1 percent to 43.7 percent.

The economic distress and misery behind those numbers demanded action. In Britain the Labour government elected in 1929 dissolved in favor of the formation of a National Government made up of members of the Labour, Liberal, and

Conservative parties in August 1931 that took Britain off the gold standard. In Germany the severity of the economic crisis and unemployment caused the government of Heinrich Brüning (1885–1970) to rule by emergency decree. His deflationary policies led to tremendous social conflict, but in the end the ruling clique around President Paul von Hindenburg (1847–1934) persuaded him to appoint Adolf Hitler (1889–1945), the head of the right-wing Nazi Party, as chancellor in January 1933 to avert what they saw as a left-wing threat to social stability. In France a Popular Front government of communists, socialists, and radicals was elected in 1936 to stanch the economic tailspin of the French economy. The Popular Front introduced paid vacations, promised a 40-hour workweek with no cut in pay, and floated government bonds in an attempt to reinvigorate idle economic capacity in France. The Popular Front fell in March 1938, and a more conservative government took over that ended the 40-hour week, instituted wage and price controls, and used army troops to break up an attempted general strike in 1938.

The most radical and successful solution to the Great Depression came out of the policies of Nazi Germany, which continued the state of emergency begun under Brüning. The Nazis used their emergency powers to destroy democratic institutions, labor unions, and other political parties starting with the communists and socialists and set up a one-party state. Under the Nazis the state controlled not only foreign trade but also prices, wages, and investment, and it was state investment in industry that revived the German economy. In 1934 the level of government investment in public works, industry, and construction doubled and in 1935 increased by another 60 percent. Wages were kept low and failed to keep pace with the rising national income, leading to a reserve of capital for further investment. These policies were so successful that by 1937 Germany was experiencing a labor shortage. However, from 1935 onward the goal of these investments and the Nazi drive toward autarchy (economic self-sufficiency) was the creation of a powerful war machine that could launch the wars of aggression against Germany's neighbors that Hitler believed were necessary to ensure German economic growth and greatness.

It was the military buildup to World War II that ended the Great Depression in Germany, and it was similar build ups in Britain, France, and the United States that ended it there as well. The human cost of that war on the battlefield and in concentration camps was staggering; nevertheless, the merger of militarism and capitalism brought about by World War II and the large government expenditures entailed have served as a recipe to avert another economic depression in western Europe.

The Great Depression in Latin America

The Great Depression marked a significant turn for Latin American economic policies and patterns of growth. The crisis put into question the outward-oriented model of growth that relied on the export of raw goods that had been adopted by most countries in the region since the second half of the nineteenth century. The effect of the economic shock and the policies implemented differed from country to country. In general, Latin American economies resorted to inward-oriented policies characterized by import substitution industrialization (ISI) and strong state intervention in the economy, giving way to new models of economic development. The crisis also helped discredit the political elites who had advocated the export-led economic model, paving the way for political changes in many Latin American countries.

During the second half of the nineteenth century Latin America became integrated into the world economy. The two main features of this economic scheme were the exporting of primary products from Latin America to Europe and

the United States and the importing of manufactured goods and capital into Latin America from the industrialized nations, in particular Great Britain. Unrestricted trade and the adoption of the gold standard constituted two other important components in this economic scheme. In spite of the emphasis on the production of raw materials during the first decades of the twentieth century, many Latin American countries experienced slow growth in the manufacturing of nondurable consumer goods to supply, in part, the local demand. These industries, however, were not dynamic enough to act as an engine of growth, so Latin American economies remained deeply dependent on the export sector when World War I broke out.

The system created during the second half of the nineteenth century depended heavily on the existence of an equilibrium that was disrupted during World War I and its aftermath: the global capital market suffered deeply due to the lack of investment dollars, the gold standard was abandoned by many nations, and foreign loans were called in. The commodity market was also deeply affected. The terms of trade for nonstrategic materials deteriorated during the war, and shortages of shipping vessels added to an already difficult economic situation for the Latin American nations. With the end of the war things went back to normal, with some changes. The United States clearly emerged as a dominant power in Latin America not only as a commodities supplier but also as a major capital provider through loans and direct investments. Latin American economies experienced a minor shift in the direction of diversification and industrialization. Nevertheless, Latin America still relied heavily on the export sector, thus maintaining its vulnerability to adverse conditions in the international market. This vulnerability became apparent with the stock market crash of October 1929.

The 1930 crisis diminished the international market for Latin American exports and inaugurated a protectionist period that marked the end to the commitment of international markets to free trade. International demand for beef, wheat, coffee, sugar, and minerals declined sharply. The decline in the volume of exports was accompanied by a decline in export prices as well, thus severely affecting Latin America's purchasing

➤ LÁZARO CÁRDENAS

During the presidency of Lázaro Cárdenas (1934–1940), the original ideals of the Mexican Revolution acquired new strength. Cárdenas regarded land distribution as being of primary importance to improve the well-being of the population. He presided over the distribution of 44 million acres of land among landless peasants. The program struck a heavy blow to the traditional hacienda system. By 1940 the lives of hundreds of thousands of peasants had improved as a result of land reform, public education, medical care, and significant infrastructure improvements in rural areas. Another remarkable episode during his government was the nationalization of foreign oil companies and the creation of a state oil monopoly. Mexico's oil nationalization provided cheap and plentiful fuel needed for the development of domestic industry and was celebrated as a significant step toward national economic independence.

—Patricia Juárez-Dappe

power. Between 1928 and 1932 Latin America's import capacity fell 45 percent, which in turn affected public revenues highly dependent on external trade taxes. Interest rates on public and private debt remained unchanged and increased the pressure on Latin American governments, which had to allocate a larger share of export revenues for the service of the debt. These disruptions gave rise to budget deficits and a negative balance of payments that could no longer be financed with new loans, as had been the case in the past.

Governments acquired a more active role in the economy and resorted to a number of different measures to restore their countries' economic balance, such as the suspension of the gold standard, import and exchange controls, and debt default. Some countries tried to protect their export sector through infrastructure development or direct manipulation of stocks. Recovery from the crisis began after 1931–1932 with the return of more favorable conditions for the export sector. However, during this period governments also committed to promoting long-term growth through structural changes. Public

works, housing, and industry, in particular, benefited from governmental assistance. Therefore, in combination with the export sector, ISI became a very important engine of growth. This period witnessed the growth of a manufacturing sector that, taking advantage of the inherited industrial capacity from the 1920s, substituted imports and supplied the domestic market with consumer goods. The leading sectors were textiles, petroleum refining, tires, pharmaceuticals, chemicals, cement and building materials, and food processing. Encouraged by credit facilities, infrastructure, and price-support programs, import substitution also affected the agricultural and service sectors.

The Great Depression represented a major landmark for economic policies and patterns of growth and development in Latin America. The crisis exposed the vulnerability of Latin American export economies and discredited the ruling elites that had advocated the export-led economic model. Open unemployment was not dramatic after the initial years of the crisis although real wages declined, thus leading to a significant deterioration in the standard of living for urban and rural workers. New nationalist political forces emerged on the Latin American scene. They pledged to create stronger and more independent economies and undertook programs to promote the general well-being of the population. The new governments made concessions to rural and urban workers through social legislation but maintained strict control over workers' organizations. They mediated in labor conflicts, passed labor codes, and implemented social security programs, thus guaranteeing a strong base of support for their regimes. As a result, the 1930s witnessed the consolidation of multiclass and heterogeneous populist alliances that challenged the long-standing predominance of the groups associated with the export-led model and paved the way for significant and long-lasting changes in the political systems of Latin America. One dramatic expression of this trend was the seizure of foreign oil properties and land distribution in Mexico during the nationalist administration of Lázaro Cárdenas in the late 1930s.

The Great Depression in the United States

The Great Depression of the 1930s was far worse in terms of both depth and length than any other contraction in American history. Although the onset of the Great Depression is associated in many minds with the stock market crash of October 1929, the economic downturn actually began during the summer of 1929. Industrial production peaked in mid-1929 at levels that would not be observed again for several years. In some sectors of the economy, weakness was apparent long before 1929; the construction sector in particular had been in decline since 1926. The 1920s, though often celebrated due to the dramatic growth of automobile and radio production and the exuberance of the stock market, had in fact been a decade of unspectacular growth, some unemployment, and concerns in many industries about future prospects.

Real gross national product—the total output of the economy—fell by 29 percent between 1929 and 1933, the year of the worst economic performance. This downturn thus erased all of the economic growth achieved in the previous quarter century. Manufacturing output fell by half. The average level of prices and wages fell by a third. Official statistics on unemployment rates were not kept at the time, but it has been estimated that the unemployment rate was at least 25 percent in 1933 and perhaps more than 30 percent. In addition, the number of hours worked

fell dramatically for many who retained their jobs, as employers cut back on output. Gross investment almost ceased, and thus the capital stock eroded through depreciation. The economy then recovered from 1933 to 1937. This was the longest recovery phase that economists had ever observed in the United States at that time. Yet it did not return the economy to the levels of output per capita achieved in 1929. The unemployment rate fell only to 14 percent. A short but sharp recession occurred in 1937–1938, and then recovery ensued. Unemployment neared 20 percent in 1938 and remained above 10 percent well into 1941. The 1929 level of output per person was only regained in the 1940s. The Great Depression, then, had not clearly ended when the United States entered World War II.

The United States was poorly prepared for this calamity. Rapid urbanization and immigration in preceding decades meant that most of the unemployed could not easily rely on friends or family, as was often the case in rural communities. Most of the unemployed had little or no savings at the start of the Great Depression. City and state governments that attempted to help the unfortunate soon found their financial solvency threatened, for their tax revenues naturally fell as output fell. The federal government had the capability to borrow but was hesitant at first to enter what seemed to be an area of local responsibility. Private charities struggled to fill the gap with soup kitchens and other activities, but their resources also dissipated, as the depression lasted longer than any had anticipated. Millions of men road the rails—boarded freight trains—to travel the country searching for elusive employment opportunities. Agricultural prices fell by half—much more than industrial prices—and thus farm incomes collapsed (especially in the drought-stricken western plains); still, many with rural connections moved back to the land and pursued a subsistence lifestyle. While the Great Depression was a national occurrence, industrial and mining regions and wheat-producing states suffered the most.

The effects of the Great Depression were also unequally distributed based on gender and ethnicity. Women and especially married women were often the first to be laid off, as even govern-

ments expressed a desire to protect the income of male breadwinners as much as possible. Blacks and immigrants were also often laid off first; the latter were often also excluded from government relief efforts. Many women, though, were able to retain jobs in the service sector that were widely perceived to be women's work. Likewise, blacks and immigrants were often able to retain some of the least-desirable industrial jobs.

There was little outright starvation in the United States, but there were severe levels of undernourishment. Death rates did not rise, but rates of many diseases, and especially childhood diseases, did. Educational attainment fell as children sought to help their families or lacked the energy to attend to their studies and as many localities closed schools or shortened the school year to save money.

Some workers moved in and out of casual employment during the 1930s. But about half of the unemployment experience involved workers who were unemployed for years at a time. The very young and very old were especially likely to find themselves in this group, as were immigrants. A great deal of family discord and psychological despair also resulted, and both marriage and birth rates were significantly lower during the Great Depression.

The administration of President Herbert Hoover hoped at first that economic recovery would set in within a year or two as it always had in the past. The Hoover administration eventually moved to fund employment relief. The most extensive efforts in this regard are associated, however, with President Franklin Roosevelt's New Deal. By 1938 some 10 percent of the American workforce was employed by government relief efforts. The Works Progress Administration (WPA) hired private firms to construct public works. The Civilian Conservation Corps (CCC) was directly managed by the government and focused on public works in the countryside and especially in national or state parks and protected areas. These relief projects, it might be noted, produced a range of valuable public works still in use today: public buildings; hiking trails, stairways, walls, and chalets in national and state parks; and works of public art.

■ Introduction: Half Century of Global Economic Change

From 1900 to 1945, the global economy expanded rapidly as a result of growing industrial capability, improved transportation, more efficient communications networks, and an emergent international consumer culture. These developments affected all world regions to a greater extent than in any prior periods in world history. Despite two world wars and the interwar collapse of the global economy, trade and commerce expanded by leaps and bounds during this period. Growth continued during wartime as developing world regions gained a larger share of the global markets, producing an increased amount of consumer goods while European countries were forced to concentrate on war production. Moreover, as European economic domination ebbed during this period, other world regions such as India, China, and Mexico expanded their economies. These countries initiated their own unique processes of industrialization and modernization within their own cultural contexts. However, such developments also vastly changed cultural traditions and lifeways.

—*Abraham O. Mendoza*

Economic Change in the Developing World

Between 1900 and 1945, societies that had been dominated by European powers went through dramatic economic, political, and social changes. They achieved increasing levels of autonomy during the world wars and were less amenable

to outside dominance after those periods of relative independence. Sub-Saharan Africa, the Middle East, Latin America, and Asia all experienced varying degrees of economic development, vast internal migration, and improved infrastructural expansion, albeit at differing levels. While many of these changes were due to the diminishing of European imperial power, they were also a result of increased regional nationalist sentiment and calls for independence.

In 1900 much of the world was controlled by European states. While vast regions of Latin America, Asia, and the Middle East did possess nominal political independence, they were heavily influenced by European financial interests, particularly that of the British, which had a great degree of influence on their political structures. For example, Mexico, China, and Egypt, while de facto independent politically, were dominated by Western financial institutions. New York City and London, as the main centers of Western finance, had a tremendous influence over the fortunes of these subordinate economic regions. In spite of their formal political independence, the Ottoman and Qing empires were vulnerable to European military and financial dominance, as were the Central European Habsburg and Russian empires. Much of sub-Saharan Africa, South Asia, Southeast Asia, and the Caribbean was under the direct political control of European empires (e.g., British, French, German, Dutch, Portuguese, Spanish, Belgian, and the United States). There are still heated debates about the ultimate economic impact of the colonial period,

but it certainly delayed industrialization in the subordinate areas, which generally exported raw materials and imported the more profit-generating manufactured wares.

The two world wars revealed European vulnerability and inspired national independence movements throughout the remaining colonized or subordinated lands. The Middle East, South Asia, and Southeast Asia developed as pivotal economic actors during World War II, even if they were still ostensibly political colonies. Formal imperial domination in sub-Saharan Africa, Southeast Asia, and the Caribbean continued in spite of increasing demands for full political independence. The wartime use of colonial troops by European forces, as well as the loss of other colonies to Japanese occupation, highlighted both the importance of colonies to the metropolises as well as the weakness of the West. Attempts, particularly by Great Britain and France, to restore the prewar colonial relationships contributed to growing resentments among peoples who had become much more confident and self-reliant during the wartime years. During the war, the levels of investment in Latin America, Oceania, and Asia, due primarily to wartime needs, had increased the industrial capacity of those regions and led to development of production centers in their own right. Moreover, the Marxist-Leninist model of socialism in the Soviet Union offered a model of development that contrasted with the capitalist model. Although the old European/American power structure was altered by World War II, new economic pressures inspired by the post-war balance of power became a factor in establishing late twentieth-century international economic relationships.

Economic Change in the Industrialized World

Radical changes occurred in the industrialized world between 1900 and 1945, brought about by technological advances, global economic development, and the effects of total war on different regions. Much of the world became interconnected through transportation and communications networks vastly expanded through increased technological innovations such as larger steamships, underground telegraph lines, and long-range radio. The two world wars also forced massive changes that influenced the growing role of the state in the lives of individuals, rapid technological innovations, and synthetic replacements for scarce raw materials. In addition to these positive developments, science and technology also allowed for the creation of new methods for destroying human life, most notably in the development of Zyklon-B and the atomic bomb.

Before 1914 much of the capital of the developed world was concentrated on internal industrial development and global market networks, which caused the expansion of widespread empires to seem both necessary and rational. Britain, France, Germany, Italy, Japan, and the United States, as well as some minor European nations, dominated much of the world's trade. Those major powers controlled large colonial empires in Asia, Africa, and Oceania. Technological developments from the previous century, such as trains, subways, motorcars, electric grids, and centralized plumbing networks, were ubiquitous in major metropolitan areas.

The outbreak of World War I in 1914 accelerated technological and economic development, and also opened the door to a growing role of nation-states in daily life. The juxtaposition of new technologies on the battlefield such as the machine gun, long-range field guns, and mustard gas with the traditional implements of war such as horses and bayonets combined with older battle tactics caused the deaths of thousands upon thousands of soldiers. The western front, characterized by barbed wire along no-man's-land, shell holes, and corpses strewn about, left a deep imprint in the minds of many who now saw western progress as an empty promise. European governments all increased their power

➤ TECHNOLOGICAL ADVANCES IN WAR

World War II led to the development of various technological breakthroughs as a result of wartime necessities and scarcities. Technological developments such as radar, rockets, jet engines, chemical synthetics (i.e., nylon, synthetic rubber, and lubricants), and early computers, among other innovations, emerged directly out of their value in the conduct of war. These innovations would have a direct impact on the development of a prosperous postwar economy in most of the West, as these products were developed into consumer goods, eagerly purchased by consumers who had endured deprivation during the war. Advances in the chemical industry led to significant innovations in synthetic products such as herbicides, insecticides, and exfoliants, which were used simultaneously in both the Green Revolution and in subsequent proxy wars (such as the Vietnam War). However, other developments such as atomic and biological weapons, satellite technology, ballistic missiles, and so-called wonder pesticides (e.g., DDT) would have severe ramifications in the subsequent Cold War period, leading to diplomatic superpower confrontations (between the United States and the Soviet Union) and widespread environmental degradation. In spite of the blessings derived from wartime innovations, many of these products came with a severe price for posterity.

—Abraham O. Mendoza

in order to harness national and colonial resources for the purposes of war. In addition, they generally silenced opposition, increased surveillance of potential foreign agents within the domestic population, and mobilized their economies for war. The interwar period, building on precedents established during World War I, expanded the reach of the developing welfare state, providing economic safety nets for seniors, the disabled, and the unemployed.

World War II, much like its predecessor, accelerated technological and economic innovations throughout the West. Britain had already developed its industrial base for the conduct of war but remained dependant on its overseas dominions and on U.S. support to continue its fight against Germany. Nazi Germany and fas-

cist Italy had created a formidable war machine based on the mobilization of their populations for the conduct of war while maintaining rationing systems for food and consumer goods. When some goods became scarce, chemical industries filled the gap by creating synthetic products, allowing for the creation of entirely new products. Most of the damage was inflicted on enemy terrain during blitzkrieg attacks and aerial bombardment. Within five years, in 1945, the economic situation was drastically altered for the West. The former Nazi Third Reich and Japanese East Asian Co-Prosperity Sphere were destroyed by the Grand Alliance onslaught on multiple fronts and the aerial bombardment of Axis cities and industrial centers. This led to severe economic dislocation, infrastructural destruction, and dislocations of huge numbers of people, both national populations and enslaved laborers from their occupied territories. In 1945 most of the formerly occupied countries of western Europe and Asia were completely dependent on Allied goodwill for sustenance. The European and Japanese metropolises, at the pinnacle of their power back in 1900, now lay subservient to the new Cold War superpowers in a bipolar world.

The Role of Gender in Sub-Saharan Economic Activity

Gender has played a significant role in sub-Saharan African economic activity during both the precolonial and postcolonial periods. Although gender roles were often distorted by colonial officials and patriarchal societies to deny women their achievements, historical information about African women illustrates their contributions to commerce, especially the local production and distribution of goods. Furthermore, women have

oftentimes not been commended either for resisting colonial projects that affected their economic power or for negotiating terms or tasks favorable to their conditions during colonialism. The social and economic injuries that were inflicted by colonialism were largely absent in past debates, although they were major factors that contributed to denying women the control of property. While men were generally portrayed as active participants in urban trading, women were usually relegated to the domestic sphere and rural manual jobs, with little or no access to or experience in commerce.

Views about the role of women in African economic activities tend to suggest that women were hapless victims who were passive in their interactions with men in economic activities. In truth, however, women in the precolonial period occupied very influential positions in commerce, especially in textile, kola, palm oil, and rubber trading. To understand the role of gender in sub-Saharan Africa, it is vital to trace the role of men and women beyond traditional male roles as hunters and female roles as gatherers. While men generally controlled long-distance trading, women were active agents who negotiated and initiated trading routes and networks within their local communities and along the coast. Women competed with local and foreign male traders in human cargo, gold, and cotton. At the dawn of colonial regimes women in Africa engaged with foreign merchants and explorers in diverse trading activities including farm produce, spices, handicrafts, and clothes. On the local front women in commerce engaged in petty trading selling vegetable, cloth, soap, meat, fruits, and household goods.

African women, rather than men, primarily participated in wholesale and retail business. While men normally worked as individual entrepreneurs, women competed with other women while at the same time forming cooperative groups, associations, unions, and traditional banking systems to enhance their economic activities. Also, women were involved in the cotton business and textile trade, a position that allowed them some social and domestic control and mobility. On some occasions men were employed as laborers working on land and property owned by women. During colonial times Europeans not

ABA RIOT

The protest by women of Calabar and Owerri Provinces of modern southeastern Nigeria during the last two months of 1929 was christened the Aba Riot by the British colonial government. Explicitly, the colonial government used the word “riot” to delegitimize the protest of the women as senseless and unwarranted, as it was customary for hegemonic powers to describe attempts aimed at undermining the essence of domination as a riot instead of revolution or war. Locally the Aba Riot is known as Ogu Umunwanyi (Igbo) and Ekong Iban (Ibibio), meaning “Women’s War.”

The main cause of the riot included numerous oppressive policies that negated preexisting patterns of gender relations among the people. Women’s role and status during the colonial period were reduced drastically, while men assumed roles that were beyond the traditional confines. The immediate causes of the riots included fear of the introduction of direct taxation to women, and many women’s reaction was chiefly motivated by the need to halt further policies that marginalized their survival. By the time the riot was over about 50 women had lost their lives according to official statistics. The long-term effect of the riot was the abandoning of the exploitative warrant chief system, which the women successfully protested against.

—Kwame Essien

only adjusted existing traditional and pleasant community lifestyles but also modified the ways that African men and women carried out their economic activities in order to impose European values, control African economies, exploit African resources, and enrich their countries’ treasure. Europeans’ voracious appetite for wealth in Africa facilitated European capitalist advancements and simultaneously stifled grassroots commercial activities in sub-Saharan Africa.

Colonial officials also invested in railways, ports, and roads not only to provide easy access for transporting African resources such as rubber, timber, groundnut, and palm oil into Europe but also to create channels for flooding African markets with cheap European goods. For example, in 1932 the French Textile Company was built near Bouke, Ivory Coast, to derail local textile trading

activities and to weaken fledgling technological innovations by local African traders. As a result, local hand-woven clothes took a second seat to factory clothes and caused commerce to be regulated by Western capitalist systems, a phenomenon that lingers even today.

In addition, land reforms by colonial officials significantly interfered with the socioeconomic power and security of women. It stifled their upward mobility and forced them to succumb to lower-paying jobs with higher taxes. The advantage given to men in formal education also tilted gender power in their favor. Men were given a monopoly over public administration and the newest technological farming techniques, while women were kept on the margin as farm laborers producing cash crops such as cassava and yam for domestic consumption and for minimal profit.

Japanese Militarism and Industrialization

“*Fukoku kyōhei*” (wealthy country, strong army) was the rallying cry of Meiji (1868–1912) Japan. It was a big-tent ideology accommodating the views of former samurai politicians bent on repelling the Western powers forcing Japan to open and sign unequal treaties granting Westerners extraterritorial rights in treaty ports. It was an ideology that the profit-oriented business community, which was intent on unlocking the secrets of Western technology (e.g., how to run factories with steam engines), could subscribe

to and former samurai committed to empire building abroad could embrace.

The concept of *fukoku kyohei* foreshadowed several themes: Japanese domestic politics were heavily factionalized, and big-tent concepts attempted to create consensus, awarding every faction something; Japan's military drive was partially defensive—maximizing security in the cutthroat world of international power politics—and partly offensive aimed at gaining regional dominance in East Asia; in both domestic and international matters, alliances of convenience were essential; and Japanese militarism before 1945 was tightly connected to Japan's industrialization.

Although during the early Meiji period Japan was predominantly agricultural, under Tokugawa rule, villages had made impressive gains in producing crafts for market: tea, silk thread, woven cotton textiles, hemp rope and clothing, organic fertilizers, and wooden implements used in farming. Entrepreneurship was widely diffused.

Building on this entrepreneurial base, Japanese industries using Western technology—iron and steel factories, integrated spinning and weaving factories using steam power, steam shipbuilding yards—sprang up. By the turn of the century, an industrial belt stretching from Tokyo and Yokohama in the north to Osaka and Kobe in the south had sprung up on Japan's Pacific Ocean coastline. This belt constituted the economic base for Japanese militarism, spewing out the battleships, aircraft carriers, and fighter planes that the Japanese military employed in its many wars between 1894 and 1945.

The military leadership of an island archipelago lying off the Eurasian landmass bent on securing great power status in the region for centuries naturally wanted to build both army and navy, its army to take on the two great Eurasian powers in its region, China and Russia (later the Soviet Union), and its navy to take on the two great naval powers of the Pacific, the United Kingdom and the United States. Trying to deal with these enemies sequentially, picking them off one by one, Japan's leadership entered into various alliances of convenience. Ultimately, however, it fought all of these enemies simultaneously.

Building upon its victory over China in the mid-1890s, Japan fought a second successful war

against Russia in 1904–1905, securing control over the South Manchurian Railway. Defending the railroad became a principal focus of the Kwantung Army, originally placed in northern China to oversee the Kwantung Leased Territory that Japan had obtained. Pressuring Korea from its Manchurian base, Japan ratcheted up its demands on Korea, formally incorporating it as a colony of the Japanese empire.

Allied with England in the Anglo-Japanese alliance of 1902, Japan helped defend the interests of the British empire during World War I. However, its main actions during the period from 1914 to 1918 were strictly opportunistic. Realizing that the European powers that had been dividing up China into separate zones were tied up fighting each other and thus too distracted to object, Japan presented China with a set of demands effectively making it a dependency of the island nation.

In the aftermath of World War I, the United States and the British dominions—Canada and Australia—pressured England to abandon the Anglo-Japanese treaty. In its place, a new treaty regulating naval affairs in the Pacific was negotiated in Washington during 1922. Under its terms, the powers agreed to not carve up the “Chinese melon” any further, and the five negotiating powers (the United States, the United Kingdom, Japan, France, and Italy) agreed to set limits on the tonnage of their war-making ships. Reluctantly, the Japanese Navy agreed to sign off on the Washington Naval Treaty. In the aftermath of Japan’s accession to the treaty, however, the Naval High Command split into two factions: one opposing renewing the treaty, the other willing to operate under rules largely dictated by the United States and England.

Japan also operated in concert with the United States dispatching troops into Russia during the Russian Revolution, finally withdrawing its army in 1922 when it signed a peace treaty with the Soviet Union. Pulled out of Russia and restless to expand its military influence in Manchuria and northern China, the Kwantung Army carried out a series of provocations during the 1920s aimed at triggering war with the Chinese warlord ruling Manchuria. The Mukden Incident engineered by the Kwantung Army, blamed on the Chinese by Japan, ushered in full-fledged

THE KWANTUNG ARMY

The Kwantung Army played a crucial role in shaping Japan’s military and political posture on the Eurasian mainland during the first three decades of the twentieth century. Established after the Russo-Japanese War of 1904–1905, the Kwantung Army was to defend the Kwantung Leased Territory along the South Manchurian Railway that had been wrested from Russia during the war. During the 1920s the army focused on bringing all of Manchuria under its control, and in 1931 it blew up a portion of the South Manchurian Railroad, blaming the Chinese for the attack. Operating behind this trumped-up fabrication, the Kwantung Army managed to swallow Mukden, eventually conquering all of Manchuria and creating the puppet state of Manchuko.

From its base in Manchuko, the Kwantung Army pushed eastward, threatening to seize Chinese territory in the south and Soviet-dominated Mongolia in the north. Penetrating Inner Mongolia in 1933, the Kwantung Army began probing territory that the Soviets were intent on keeping as a buffer zone between themselves and the Japanese-dominated Manchuko. In 1938 at Zhanggufeng and in 1939 at Nomonham, the Kwantung Army fought the Soviet Union’s Red Army and went down to bloody defeat.

—Carl Mosk

war, paving the way for Japan to absorb Manchuria and create the puppet state of Manchuko.

Internationally, breakdown in trade caused by the collapse of the gold standard system and friction between ideologically opposed powers (communist, fascist and liberal democratic) by beggar-thy-nation tariff wars intensified the worldwide drive of big powers to create trade blocs. Following this logic, the Japanese bureaucracy began planning for the creation of a Greater East-Asia Co-Prosperity Sphere centered on Japan’s growing industrial might during the late 1930s. These developments played into the hands of the faction of the Japanese Navy opposed to the Washington Naval Treaty system. Following the faction’s demands Japan withdrew from the treaty, thereby rendering it a dead letter.

Under the banner of creating a trade bloc in Asia, the Kwantung Army’s interventions in

Manchuria and northern China brought Japan to the brink of war with both China and the Soviet Union. Tensions with the Soviets were high because Manchuko shared an extensive border with Outer Mongolia, which was a client state of the Soviets, while tension with China was ongoing after Japan created the puppet state of Manchuko. In 1937 a full-scale invasion of China by the Japanese Army commenced. Shortly thereafter, the Kwantung Army briefly fought the Soviet Army along the Outer Mongolian-Manchurian boundary, with the Japanese troops being overwhelmed by a Russian tank onslaught. Extricating itself from this defeat, the Japanese Army command decided to concentrate on China, and a nonaggression treaty was negotiated between the Soviet Union and Japan.

As Japan pushed farther into China, the United Kingdom and the United States looked on with alarm. Washington took a series of steps designed to signal its displeasure with Japan's aggression in China: cutting off export of scrap iron and steel to Japan, moving the headquarters of the Pacific naval fleet to Honolulu from the West Coast, and pushing for a naval expansion bill designed to vastly increase the size of the Pacific fleet. Realizing that it had a very short time to operate in prior to the U.S. Navy becoming dominant in the Pacific, the Japanese High Command rolled the dice. It decided to take out the American Pacific fleet, attacking it at Pearl Harbor in December 1941 and ushering in full-scale war with the United States.

In 1945, its industrial belt having been decimated by American firebombing and facing an alliance of enemies that now included the Soviet Union, which let its nonaggression treaty with Japan lapse, Japan's government surrendered unconditionally. In this act of submission Japan not only surrendered but also saw the *fukoku kyohei* policy, the mantra of Japanese militarism for eight decades, perish in the ruins of its military defeat.

The Importance of Colonial Raw Materials

In the first half of the twentieth century, European and North American manufacturing and commerce relied on the extraction and processing of raw materials from European colonial dominions. The development of large industrial concerns and expansive international markets was based on the ability of European empires to extract raw materials from their colonies. Consumer goods produced in the colonies, such as coffee, tea, and soap, were also in high demand throughout the West. Moreover, during World War I and World War II, colonial raw materials were pivotal in the total mobilization of the wartime economies of the belligerent parties. Scarce or unavailable in Europe and North America, items such as petroleum, nitrates, and rubber acquired extreme importance in the conduct of war to the extent that their regional sources became prone to conquest by those powers that deemed them absolutely necessary for continued expansion.

Before World War I, much of the raw cotton, cash crops, alloys for steel manufacturing, and petroleum in Europe and North America was coming in larger and larger quantities from the European colonial empires in Africa, Asia, and Latin America. For example, Britain relied on Indian tea, Egyptian cotton, and African palm oil for domestic consumer goods and products for export. To a degree, the economic dependence of Latin America on Britain and the United States made them akin to colonies in spite of their political independence. This situation created an imbalance between the European commercial cores and their colonial peripheries in which their colonies and economic dependencies re-

mained mere sources of raw materials for export while also remaining relatively industrially undeveloped in contrast with their respective metropolises. Most of their imports and exports were decided by their colonial masters, ultimately depending on the uncertainties of the international market.

World War I, which rapidly revolutionized the economies of the West in terms of their mobilization for total war, created a deeper dependence on the raw materials of the colonized world for the conduct of war. The Central Powers, cut off from their external trade, relied on extracting their raw materials from their domestic and occupied zones or, in the case of Germany, by developing synthetic materials in their chemical industries. In contrast, Britain, France, and the United States relied on European colonies for many of the raw materials necessary for war mobilization. Upon the defeat of the Central Powers, the victorious Allies scrambled for the spoils of the former Ottoman Empire in the Middle East. Oil reserves in the British Mandate of Iraq and the protectorate of Iran became a main geostrategic interest in the Middle East that created rifts between Britain and its former allies, France and the Soviet Union.

World War II illustrated how pivotal colonial raw materials were perceived by the aggressor powers of Germany and Japan. Nazi Germany was keen on maintaining control of Romanian oil fields and in seizing Soviet oil fields to sustain its modern war machine in the field. Cut off from international overseas trade, Germany also extracted most of its raw materials from occupied Europe and neutral countries such as Spain and Sweden (from which it received most of its iron ore) for war manufacturing. The expansion of the Nazi Empire in Europe created an autarkic economic system of exploitation, which ensured the constant supply of raw materials from occupied Europe to the Reich in the form of coal, steel, and other materials necessary for the war effort.

The Great War and Industrial Production in Europe

The outbreak of World War I in 1914 and the resulting stalemate on the western front created a conundrum for both the Entente and Central Powers. A war of movement similar to those of the late nineteenth century was expected by army staffs on both sides of the front, not one in which the forces would be so evenly matched that attrition would be the only feasible strategy. The result was the total mobilization of the economy for the purpose of conducting total war. Britain, France, and, to a greater extent, Germany mobilized their economies to supply munitions and food for the soldiers while rationing and cutting production in consumer goods for civilian use. This unprecedented development in national economic infrastructures was recognition on the part of all belligerents that their entire national economies would have to be mobilized in order to win the war. With a disproportionate amount of young men on the front, the labor pool from which to draw from had to consider taking women as viable workers. As the war continued, Britain and France grew to rely more on U.S. matériel and loans.

During most of the war, Britain's geographic location made it vulnerable to being cut off from the continent as well as from its empire by unrestricted submarine warfare, but it still relied on the empire for supply and matériel to a significant extent. While supplies at the front in the initial year of the war were adequate, as growing numbers of men went to war this necessitated a government response. Furthermore, by 1915 there was a shortage of shells that provoked a public outcry against His Majesty's government. This resulted in the creation of the Office of the Minister of Munitions, which was in charge of coordinating the allocation of resources for production, the actual production, and the distribution of munitions for all branches of the British military. Subsequently, the Munitions of War Act of 1915 prohibited recruitment and conscription of munitions workers without notification of their respective employers. Furthermore, British dominions were put under the jurisdiction of the Imperial Munitions Board to produce war

matériel for the remainder of the war. Rationing programs, conscription of soldiers and workers, and government oversight of industrial production geared for war were ubiquitous in Britain for the remainder of the war.

France was directly confronted by the German Army right on its border and thus was forced to mobilize its economy for the purpose of national survival, as its forces were depleted along the fronts. In the first year, France was able to engage its soldiers along the fronts while suffering shortages in supplies and materials, but the government intervened to some extent in economic mobilization to meet the needs of the military. The French government, acting under the premise of national emergency (which given the proximity of German forces was warranted), mobilized the French economy for the purpose of conducting total war. Along the same lines as in Britain, this meant rationing, government oversight of industrial production and resource allocation, and ensuring the speedy distribution of artillery pieces, shells, and guns for the military. In 1915 the French government ap-

pointed Albert Thomas undersecretary of state for artillery and munitions to increase munitions production. France was able to ensure that agricultural production and food shortages on both the war front and on the home front were minimal, while industrial production churned out the necessary implements for warfare. However, the French were prone to standardizing their field guns to one model rather than developing several, viewing expediency of production, rather than technological innovation, as a higher priority.

Germany was faced by a two-front war while being cut off to overseas resources. As a result, it faced a grimmer picture in terms of its economic vulnerability. However, the German government was amenable to ensuring the rapid and complete economic mobilization of the economy for the purpose of war. To a far greater extent than any of the other belligerents, the German government, in tandem with the General Staff, made significant strides in ensuring that agricultural and industrial productions were adequate for supplying both soldiers and civilians, as well

as their allies, on all fronts. The German Supreme Army Command (Oberste Heeresleitung) made most of the major economic decisions with key German industrial concerns, which profited from the war. However, despite the surge in industrial output due to the total mobilization of the German economy for total war, it also led to ubiquitous food shortages.

Russia, Austria-Hungary, and Italy also mobilized their economies to a significant extent while depending on their far more affluent allies for a considerable portion of their matériel. Austria-Hungary depended on Bohemian (Czech) industrial output for most of its munitions, and Italy relied on its northern industrialized regions for its matériel. Shortages in Russia led to the Russian Revolution. Nonetheless, these states also experienced increased government controls over economic life, geared toward increasing production of war matériel and allocation of national resources to that purpose.

German Precision Production versus U.S. Mass Production

During World War II (1939–1945) the United States and Nazi Germany mobilized for war, relying on differing strategies concerning the quality and quantity of military equipment. The U.S. war effort relied on the cooperation between business and labor interests under the close scrutiny of federal officials under the War Production Board (WPB). Moreover, total mobilization of the U.S. economy for war entailed careful economic planning, taking note of supplies of raw materials, prioritizing the armament industries, and maintaining supplies of consumer goods for domestic consumption. In contrast, the chaotic nature of German leadership at both the state and party levels and their haphazard

delegation of power between various factions allowed the focus on total mobilization to waver well into 1942, when the decision was finally made to mobilize for a total war economy three years after hostilities had commenced. This glaring contrast provides the reason behind the German emphasis on the production of precision equipment versus the U.S. mass production of war goods based on economies of scale.

In the 1930s the New Deal economic and social policies of President Franklin D. Roosevelt failed to catapult the United States out of the Great Depression. However, it did set a precedent for increasing government interference in economic planning and resource allocation. In the period immediately preceding the entry of the United States into the war (1941), the federal government had already begun to slowly mobilize small numbers of munitions industries for defense. Upon entry into World War II following the attacks on Pearl Harbor (December 7, 1941), the U.S. government decided upon the full economic mobilization for war on two fronts, with the emphasis on equipment rather than manpower. Working in close collaboration with business interests and labor organizations on whose cooperation it relied, the federal government was able to entice both to participate in the war effort by means of offering lucrative contracts. Federal economic planning, including the allocation of raw materials, the division of mass production between the two coasts, the imposition of wage and price controls, civilian rationing, and the shifting of large factories from civilian to war production, rapidly ensued. Large amounts of war matériel, not only for use by U.S. forces but by the Grand Alliance, were made available through the Lend-Lease Program. Tanks, planes, artillery, and shells in addition to uniforms, equipment kits, and other war goods were churned out in large numbers. By focusing on one model, such as the M4 Sherman tank or the B-17 Flying Fortress bomber, U.S. manufacturers emphasized quantity rather than quality. Mass production of these goods was prioritized over quality and precision. Although oftentimes inferior to Axis equipment, their sheer numbers overwhelmed the combined industrial output of all the Axis Powers.

In contrast, German manufacturing placed higher priority on precision items, oftentimes

► THE ECONOMIC PURPOSE OF BLITZKRIEG

In an effort to fight war without mobilizing the German economy for total war and to produce both “guns and butter” for the domestic German population, Adolf Hitler and his military commanders adopted the strategy of lightning war (blitzkrieg) in the late 1930s. By combining aerial, artillery, and tank attacks in combination with infantry en masse in concentrated attacks to surround and destroy enemy forces, typically in pincer movements, German military forces were able to project German might rapidly and effectively. Moreover, by quickly destroying enemy forces, German military forces could be rapidly deployed elsewhere, having set up a smaller occupation force typically in league with a quisling (collaborationist) government in power (Vichy France, the Netherlands, and Norway). This tactic provided Germany with the capability of launching war on the cheap and capturing territory and resources as bases for future expansion. This would provide the domestic German population with evidence of military prowess and garner increased support for the Nazi regime while simultaneously showing off German military capability among allies and foes alike. However, once the Third Reich was at war on two fronts against both the United States and the Soviet Union (1941), whose secure land bases and large human and natural resources were not as vulnerable to blitzkrieg as were the smaller countries of western Europe, this tactic would eventually prove futile.

—Abraham O. Mendoza

A German motorized detachment rides through the remains of a Polish town during the Blitzkrieg of September 1939, illustrating the success of this strategy of “lightning war.” (Library of Congress)

resulting in smaller quantities of high-end equipment. Multiple models of German fighters, tactical bombers, heavy tanks, and guns, while superior to U.S. armaments, were produced in smaller increments and subject to increasingly long periods of testing before production. At times, plans for mass productions were scrapped when small improvements were made on specific models. The haphazard way in which decisions were made at all levels of the Nazi regime, with party, state, and military officials having a say, created multiple bottlenecks in production. Having multiple versions of bombers, fighters, tanks, submarines, and guns while providing optimal

quality and choice could not openly compete with overwhelming U.S. production. Moreover, Allied aerial bombing attacks over German cities severely cut German productivity, as factories and labor were decimated and thus rendered incapable of working for long periods of time. Vulnerable to air attacks, German industry was increasingly successful in surviving by retreating to huge underground factories specifically built to withstand air attacks. However, these facilities merely prolonged the war to the bitter end for the Third Reich.

The total war mobilization of the German economy under German minister of armaments

Albert Speer in 1942 had a sizable impact on increasing German output of war goods but was nonetheless incapable of keeping up with aggregate Allied production or even with U.S. productivity alone. This also resulted in the retention of older forms of technology, such as horses and carts as modes of transport. Perversely, the German authorities placed a higher priority on resource allocation for the destruction of the European Jews in the Holocaust than on war mobilization.

Soviet Production and World War II

In the decades leading up to World War II, the Soviet Union undertook industrialization in an unprecedented manner, much of it geared toward militarization. The collapse of production in the civilian sector that followed the revolution forced Lenin's new government to briefly allow some free-enterprise industrial activity in the early 1920s under the New Economic Policy (NEP). On a longer term, though, the Soviet government was committed to following the Marxist economic theory that central planning and economies of scale could create an industrial economy more efficient than a capitalist economy. A series of economic five-year plans, starting in 1929, first concentrated on infrastructure and heavy industry, with subsequent development of various manufacturing sectors.

Even before the first five-year plan, a top Soviet priority had been self-sufficiency in military production. Western engineers hired to help in a number of industries in the early 1930s observed that almost all factories, including those ostensibly for producing consumer goods, were primarily designed to manufacture military equipment,

Rows of mass-produced Soviet tanks roll toward the battlefield in June 1941. (Hulton-Deutsch Collection/Corbis)

and thus there was great difficulty producing civilian goods in them. Due to the misinterpretation of those apparent failures in civilian manufacturing, there was a tendency outside the Soviet Union to underestimate the Soviets' industrial abilities as well as the portion of their economy devoted to the military sector. This would later lead to the perception that the expansion of industry during the war was much greater than was actually the case.

Part of Soviet planning was to locate new and to relocate existing strategic industrial assets deep inside the country. Thus, even before the outbreak of the war with Germany in June 1941 new infrastructure was in place, many factories had been partially or completely moved from the western areas of the Soviet Union, basic facilities had been constructed for other factories and workers in anticipation of their relocation, and most new industrial development was taking place in the Ural Mountains and areas farther east. Despite the collaboration between Germany and the Soviet Union in the division of Poland in 1939 and the Soviet agreement to supply petroleum products and other commodities to the Germans as the latter fought France and Britain in 1940 and early 1941, Stalin considered war with Germany inevitable. However, he was caught off guard by the timing of the German attack, and there was a brief period of panic and chaos in which it appeared that the

➤ FARMING COLLECTIVES AND SOCIAL UNREST IN THE SOVIET UNION

The industrialization that enabled the Soviet Union to successfully fight the mechanized warfare of the 1940s came at a terrible price. Farming was collectivized in the 1930s to gain control over agricultural commodities that could be traded for machinery abroad. Met with widespread resistance to the expropriation of private farms, the Soviet government responded with mass deportations and confiscation of virtually all foodstuffs. Ten million Soviet citizens died of starvation or from unbearable conditions in slave labor camps. Industry expanded, but the agricultural sector was devastated, and hundreds of thousands of Soviet citizens who had survived the horrors took up arms against the Soviet government during World War II.

—Leonard Leshuk

Soviet government and military might collapse before Stalin arranged a strategic retreat to the Volga River. This extended the German supply lines several hundred miles while placing the Soviet forces that much closer to their new military-industrial centers.

The accompanying industrial and human evacuation that took place, although one of the great logistical feats of history, was largely an acceleration of ongoing industrial relocation. So thorough was the removal of industrial equipment, skilled workers, and agricultural machinery that the invading Germans soon found that rather than benefiting economically from occupation of the western Soviet Union, just maintaining the minimum infrastructure and providing the basic necessities in many areas was a net drain on their own resources.

The industrial capacity of the Soviet Union became obvious to the world during the initial German attack when the Soviets lost three times as many tanks and aircraft as the Western intelligence agencies had been estimating that they possessed, and yet they still had enough to continue fighting. Although machinery and industrial technology obtained from the United States

and western Europe had enabled the Soviets to establish some very sophisticated industrial capabilities before the war, equipment for the Red Army, although functional, was generally made as simply, crudely, and cheaply as possible. This facilitated production of huge quantities of equipment to overwhelm the German qualitative advantage.

Although the Soviets relied on U.S. Lend-Lease supplies for a few critical needs such as precision industrial machinery, trucks, boots, and high-grade aviation fuel, many of the items they requested and received, including tanks, airplanes, aircraft-quality aluminum, railroad equipment, marine engines, and construction machinery, were held for postwar use. Other goods, such as foodstuffs, textiles, and lower-grade petroleum products, received from the United States were used in place of similar products that the Soviet Union, as a neutral country in the Pacific war, were selling to Japan or allowing the Japanese to obtain under concessions from Soviet territory. After the war turned in their favor and the Red Army advanced into Central Europe, the Soviets made every effort to capture German military manufacturing facilities intact, which they then moved to the Soviet Union. When the war ended, while the Western countries quickly reconverted to civilian production (greatly reducing their military capabilities until the advent of the Korean War), the Soviets continued to devote a disproportionately large segment of their industrial capacity to military manufacturing, setting the course that their economy would follow to its end.

■ Introduction: Socialism

The term “socialism” refers to a social and governmental system, based on equality and social and economic justice, that requires government intervention in economic affairs. In the more extreme form, the state, rather than individual or market forces, owns and controls the means of production, distribution, and exchange.

Socialism refers to both political doctrines and the political movement and system in which the doctrines are enacted. There are various forms of socialism, but all stress the need to redress the perceived moral flaws in capitalism. Socialists believe that capitalism was intended to satisfy people’s needs and wants at a price, which along with paid interest and the profit motive is immoral because of its inherent exploitation of labor and misappropriation of resources. Socialism stems from democracy, as the ideal of political equality is extended to economic equality. In theory, socialism is the first step toward communism. However, socialism differs from communism because it is based on democracy and ethical values and can allow for private ownership.

The development of Marxist socialism reached its peak of radicalism with the Bolshevik Party, created by Vladimir Lenin during the years before the Russian Revolution of 1917. The development of Lenin’s political thought borrowed heavily from Marxist revolutionary principles, but Marxism-Leninism included the belief that a group of dedicated revolutionaries must control—and complete—the revolution. This ideological departure led to the development of communism.

During the years following World War II, socialism developed in different ways. In Africa, countries slowly began to gain independence from their colonizers. African countries attempted to wean themselves from Western trade by developing government-controlled economies. African socialism was seen as compatible with the rise of nationalism on the continent, as many saw capitalism as an extension of colonialism. With the decline of communism, however, many countries moved toward a more open economy.

New Economic Policy

Widely known by its acronym NEP, the New Economic Policy was a temporary retreat from centralized economic control that Soviet leader Vladimir Lenin initiated at the Tenth Party Congress in 1921 and terminated by the inauguration of Stalin’s First Five-Year Plan in 1928–1929. Reversing the Bolsheviks’ introduction of state control of production and commerce in 1918, NEP permitted Soviet citizens to engage in small-scale private trade, manufacturing, and land ownership. Contemporaries regarded NEP variously as a betrayal of the Bolshevik Revolution or as an expedient compromise and necessary detour on the road to Soviet socialism.

Emerging victorious from the Russian Civil War in 1921, Lenin and the Bolsheviks nonetheless encountered dangerous challenges to Soviet rule. Having nationalized industry and property, abolished private commerce, introduced strict rationing, and forcibly requisitioned agricultural products from peasants during the period of War Communism (1918–1921), the Bolsheviks now faced an exhausted, hungry, and resentful population. In the summer of 1920 peasants in Tambov Province revolted, and in March 1921 soldiers at the Kronstadt naval base mutinied. Though the Bolsheviks brutally repressed both rebellions, drought imposed a devastating famine in the spring and summer of 1921. Several million Soviet citizens starved to death, and the Bolsheviks accepted international aid in an attempt to save the starving.

Lenin recognized the need for reform, and he understood that the peasants would need to be pacified in order for the cities to be fed and for socialism to thrive. In this regard, Lenin envisioned NEP as a necessary compromise with the disgruntled peasantry. Approved overwhelmingly by the Tenth Party Congress, NEP abolished War Communism’s system of produce requisition, replaced it with a fixed tax in kind, and re-introduced private trade to the Soviet economy.

Between 1921 and 1923 NEP evolved to become the multifaceted policy backbone of a mixed economy composed of both public and

private sectors. While the State Planning Commission (Gosplan) retained control over large-scale industry, financial institutions, and transportation (the so-called commanding heights of the economy), Soviet citizens were authorized to trade privately and to establish small-scale manufacturing and service industry enterprises. To facilitate overall economic growth, the Soviet currency was stabilized. Still under state control, foreign trade expanded.

In 1925 Nikolai Bukharin, a Communist Party theorist and outspoken proponent of NEP, encouraged the Soviet Union's capitalists to enrich themselves. Bukharin and other like-minded party leaders believed that NEP helped to stabilize the Soviet state and was a positive, necessary step toward establishing socialism. At the same time, opponents of NEP referred to it as the "New Exploitation of the Proletariat" and argued that the greed of enterprising "Nepmen" and affluent peasant "kulaks" impeded the realization of socialism. NEP prompted intense debates over the meaning of the Bolshevik Revolution and the future of the Soviet state.

Having consolidated his power over several years, Josef Stalin emerged as the driving force in Soviet politics by 1928. In that year, he announced the First Five-Year Plan, making clear his desire to rapidly develop Soviet industry, strengthen the military, and collectivize agriculture. As a consequence, NEP was dismantled, and centralized state control over the entire Soviet economy was ultimately reestablished.

Soviet Five-Year Plans

Having defeated his political rivals at the Fifteenth All-Union Communist Party Congress in December 1927, Josef Stalin moved quickly to transform the Soviet Union from a country of

peasants and relative industrial underdevelopment into an economic powerhouse designed according to socialist principles. In 1928 Stalin committed the Soviet people to rapid industrialization, the collectivization of agriculture, and the full transition to socialism. A series of ambitious centralized programs for the industrial, agricultural, and technological advancement of the Soviet Union known as Five-Year Plans underpinned Stalin's so-called revolution from above.

With his First Five-Year Plan (1928-1932), Stalin dismantled V. I. Lenin's gradualist New Economic Policy (NEP) and mobilized Soviet citizens in a collective effort to rapidly catch and overtake the capitalist West and to construct socialism in one country. Characterized by artificially high production goals, the First Five-Year Plan prioritized the development of heavy industry. The State Planning Committee (Gosplan) oversaw the building of 1,500 new factories, the construction of massive industrial complexes, and the introduction of new branches of industry such as aviation. As a result of the First Five-Year Plan's great leap forward, Soviet industrial output nearly doubled.

The collectivization of agriculture, meanwhile, was intended not only as a means of agricultural requisitioning and thus industrial financing but also as a method of controlling and sovietizing the peasantry. Although the First Five-Year Plan initially stipulated only the partial collectivization of agriculture, collectivization efforts quickly devolved into a full-scale assault on the peasantry when, in early 1930, urban brigades descended on the countryside to collectivize by force. Peasants fiercely resisted by slaughtering livestock, destroying harvests, attacking collectivizers, and fleeing the countryside. In March 1930 Stalin scaled back state plans, announced that collectivization should proceed voluntarily, and blamed all failures on collectivizers's excessive enthusiasm. Although the First Five-Year Plan achieved the collectivization of at least 14 million peasant households, it also resulted in the deportation of peasant class enemies (*kulaks*) to Soviet concentration camps and led (at least temporarily) to famine and reduced agricultural output.

The First Five-Year Plan, declared fulfilled after only four years and three months, was succeeded by the Second Five-Year Plan (1933-1937)

➤ MAGNITOGORSK

Established in 1929, the city of Magnitogorsk served both as a monument to the Bolshevik goal of refashioning life on earth and as a purported testament to the Soviet Union's enthusiastic embrace of Josef Stalin's First Five-Year Plan. Located 40 miles (65 kilometers) east of the southern end of the Ural Mountains and built atop rich reserves of iron ore, Magnitogorsk ("Magnetic Mountain City") was created with the intention of transforming undeveloped land into a center of iron and steel production and thus into a monumental symbol of a distinctly anticapitalist Soviet modernity.

Magnitogorsk and the so-named Stalin Magnitogorsk Metallurgical Complex were built from scratch by foreign—namely American and German—architects and engineers, Soviet managers and specialists, and a labor force that brought together recruited workers and punished peasant kulak deportees. Throughout the 1930s Magnitogorsk's 200,000 workers managed to build this ostensible exemplar of enlightened Soviet socialism despite living conditions that were characterized by privation if not squalor. Already in 1939 Magnitogorsk was the site of 10 percent of the Soviet Union's steel production. Its strategic importance swelled further still during World War II when it produced half of all steel used in the production of Soviet military tanks.

—Brigid O'Keeffe

and Third Five-Year Plan (1938–1942), both designed to extend the purported successes of the First Five-Year Plan in further developing Soviet industry and completing collectivization. The Second Five-Year Plan focused in particular on the training of industrial specialists and on the nurturing of a new kind of Soviet worker, the Stakhanovite. Named after a coal worker, Alexis Stakhanov, who reportedly exceeded his production quota by 1,400 percent in one night's work in 1935, the Stakhanovite movement was a campaign in which the Soviet government generously rewarded zealous workers with fame and material benefits for their record-breaking achievements. Stakhanovites figured prominently in the Soviet Union's propaganda narrative of how, under Stalin's lead, Soviet citizens had triumphed economically as capitalist coun-

tries had suffered the Great Depression. This romantic narrative, though ruthless in silencing the role that terror and coercion played in the Stalinist 1930s, did have some basis in fact. By the time of the Nazi invasion of the Soviet Union in 1941 (and thus of the Third Five-Year Plan's premature termination), the first three Five-Year Plans had indeed revolutionized Soviet industry, agriculture, communications, military, and transportation although at a very high price.

The destructive impact of World War II on the Soviet Union cannot be underestimated; entire cities were laid to waste, and an estimated 27 million Soviet citizens perished during the war. In the war's aftermath, Stalin challenged Soviet citizens to fulfill his Fourth Five-Year Plan (1946–1950) and Fifth Five-Year Plan (1950–1955). These provided not merely for economic

recovery and reconstruction but also, again, for further rapid increases in productivity and industrial development. Stimulated by war reparations paid by a defeated Germany and its allies, Soviet industry not only rebounded but also expanded, especially in the areas of aviation, armaments, and atomic energy. Stalin, however, died in March 1953 and thus did not witness the completion of the Fifth Five-Year Plan.

War Communism

War Communism attempted to prevent the total collapse of the economy, which had been left in shambles by the war and imperial and provisional government policies. It sought to mobilize national resources for the struggle against the new regime’s enemies. It also represented a Communist attempt to rapidly reshape the socioeconomic structure of the country from a market economy to one that was both centrally planned and state controlled.

There were three main phases of War Communism. First came nationalization of the major economic institutions, transportation, and foreign trade as well as large industries, all of which would be managed through a centralized bureaucracy. Next came an attempt to shift from market forms of exchange and distribution toward rationing of goods and services. Last came the application of coercion when persuasion failed to replace traditional economic stimulation. Tied to the last two, the principle of confiscation of surplus production was not just an exigency of conditions of shortages but rather was part of the socialist tenet of “equal distribution” of goods.

To manage these processes, in December 1917 the Bolsheviks established a large bureau-

cracy headed by the Council of National Economy. The council was charged with the task of planning and coordinating Russia’s future economic expansion. However, the turbulence of the Russian Civil War and Allied intervention did not support long-range planning.

Along with the general breakdown of the economy, the Bolsheviks faced related problems that required urgent solutions. One dangerous development was the loss of vast amounts of productive territory in the March 1918 Treaty of Brest-Litovsk and the lands occupied by White and Allied forces during the Russian Civil War and Allied intervention. This sharply reduced natural resources and raw materials available for manufacturing. The same territorial losses affected food production, which contributed to the downward spiral of industrial production. The workers did not receive adequate food, even though they were given priority in distribution. The vicious circle continued as industrial workers fled to the countryside in search of food, further reducing industrial output.

In response to these conditions, the Bolsheviks first tried food rationing, which failed. Next they resorted to impressment and labor conscription. Unions were no longer instruments seeking and defending workers’ rights but became government-controlled organizations for bolstering production. The government also abolished the workers’ councils, initially formed for workers to manage factories and their production. Labor conscription led to the assignment of the unemployed to any work the government required, regardless of worker training or ability.

At the same time, the need for compulsion spread to the countryside. The spontaneous seizure of land by the peasants that had taken place in 1917 did not lead to automatic support of governmental needs. Peasant landholders, large and small, were disinclined to provide their produce voluntarily to feed workers and soldiers without compensation, so the government decreed that agricultural producers would surrender all their produce above a minimum subsistence level to the government for redistribution. The needs of peasants were in turn to be supplied by the government, something that remained a dead letter due to low industrial productivity and the needs of the Red Army fighting the Russian Civil

War. Peasants responded with passive resistance, lowering their production to minimum subsistence levels.

A longer-range goal of food confiscation was to compel peasants to abandon their individual properties and join collective farms or state farms. In some instances when confiscation of even the subsistence production took place, peasant uprisings occurred. Since 80 percent of the Russian population still lived in the countryside, engaged in agriculture, and controlled 50 percent of the national income, peasant attitudes toward War Communism policies carried great weight.

By 1921 the Bolshevik leadership realized that War Communism had tried to achieve more than the nation could absorb. The transition from capitalism to a socialist economy could not be achieved in one great leap forward. At the Tenth Communist Party Congress in March 1921, Bolshevik leader Vladimir Lenin announced a departure from War Communism and declared the New Economic Policy (NEP). This policy left production of “secondary importance” under private control and made a series of concessions to placate the peasantry. The decree ended arbitrary requisitioning and instead imposed a graduated tax on surplus production of food, initially paid in kind. This tax fell heaviest on the wealthiest peasants, called kulaks, and could not exceed 50 percent of the former requisition. Peasants could sell the remainder of their surplus on the open market.

The NEP also affected industrial production. If peasant surpluses were to be sold in cities, industries had to produce more in order to offer something in return. For a few years, at least until Stalinist times, a market economy existed in Russia alongside the state-controlled economy, contradicting Bolshevik aims and intentions.

Building Socialism

The project of creating a socialist state following the collapse of Alexander Kerensky's Provisional Government and the seizure of the levers of power by the soviets in 1917 presented Vladimir Lenin and the Bolsheviks with both a monumental opportunity and immense chaos. Having inherited the rudimentary industrial base of tsarist Russia and the economic collapse caused by World War I, the Bolsheviks had to quickly improvise through the situation and create a strong centralized government, a functional bureaucracy, and centralize worker committees to create a functional socialist economy. The concept of building socialism centered on utilizing the economic base of existing capitalist structures and adapting them to create a socialist state under the leadership of the dictatorship of the proletariat.

After the Treaty of Brest-Litovsk (1918) with imperial Germany that effectively dropped

THE RUSSIAN CIVIL WAR (1918–1922)

Following the seizure of power by the Bolsheviks in the October Revolution in 1917, civil war erupted in Russia by various factions unwilling to accept the rule of the revolutionaries. Known as the Whites, these rebels against the authority of the Bolsheviks were composed of contingents of Old Regime Russian aristocrats, nationalists from various provinces of the former Russian empire, and liberals who still believed that Russia could evolve into a parliamentary democracy akin to those in western Europe. Given the divisiveness and lack of unity of these various groups, although the Bolsheviks were outnumbered, there was little common cause among the Whites other than their extreme dislike of the communists.

In 1918, confronted on multiple fronts in a circumscribed area surrounding Moscow and Petrograd, the Bolsheviks mustered their scattered militia forces under the command of Leon Trotsky into the notorious Red Army. The ideologically driven Red Army destroyed the various forces of the Whites in Belorussia, the Ukraine, and Siberia and simultaneously fought with nationalist revolutionaries in Poland. In the ensuing chaos of this civil war, the Bolsheviks were able to centralize and implement their control over the Russian state, ultimately defeating all their enemies by 1922.

—Abraham O. Mendoza

Russia out of World War I, the Bolsheviks set about creating their socialist utopia amid the chaos of the Russian Civil War (1918–1922). Immediately faced with the demands of peace and bread by the working classes, which were initially supportive of the Bolsheviks, the leadership of the party set about centralizing their control. The soviets, which were workers' councils, were crucial organizations in administering civil institutions in the vacuum left by the Provisional Government. The Bolsheviks set about infiltrating the soviets with their own agents in order to assert more efficient control by the party.

The control of factories was first delegated to worker committees. Factory owners were reluctant to work with such committees but were ultimately coerced into concessions. While these worker committees operated effectively in es-

tablishing industrial productivity, they also created various problems due to their degree of autonomy. The Bolsheviks did appreciate giving the workers legitimacy in running their own affairs but recognized that centralization required that they have a greater degree of agency in regard to industrial output, especially in the midst of the civil war. Party organizations and bureaucracies were implemented to work with these worker committees, setting them up as trade unions to better control them and then disregard them. In this manner, the Bolsheviks reduced the influence of worker committees and augmented their control of factories and overall industry under the policy of War Communism.

Many of the bureaucracies created by the Bolsheviks were modeled on those created in western Europe during World War I. The German military implemented a strong centralized committee to plan economic output to meet the demands of total war. The Bolsheviks copied this method in setting up bureaucracies and other party organs to replace those created by the soviets. Under this rapid centralization, the government would infiltrate the existing soviet or worker committee with its own agents and/or create a government bureaucracy to replace it. Given the contingencies of the Russian Civil War and Allied incursions in the far north and east, the Bolsheviks utilized the policy of War Communism to assert their control over industry. Resistance by labor was eventually met by coercion in the gradual creation of a police state. Vladimir Lenin developed the *Cheka* (secret police) to engage potential dissenters as saboteurs and wreckers of industry.

State capitalism, as defined by Lenin, stipulated that a level of private enterprise needed to exist in order for Russian society to evolve into the eventual socialist state that the Bolsheviks were building. However, this form of capitalism was tightly restricted and controlled by the Bolshevik bureaucracies that had already wrested control from the worker committees. Through the periods of War Communism and the New Economic Policy (NEP), small entrepreneurs managed to preserve their existence in cooperation with the Bolsheviks. This was seen as a fundamental and necessary step in the evolution of Marxism in Russia by Lenin. When the NEP was

abolished by Josef Stalin in 1924, the state assumed direct control of planning the entire Soviet economy in an effort to build socialism.

Stakhanovite Movement

The Stakhanovite movement began in the Soviet Union during the Second Five-Year Plan in 1935 in order to motivate workers to exceed their prescribed quotas, thereby increasing aggregate industrial production. The accelerated rate of industrialization set by the Second Five-Year Plan, designated by General Secretary Stalin and the top echelons in the leadership of the Communist Party of the Soviet Union (CPSU), required that workers abide by an unrealistic socialist work ethic emphasizing high productivity for the purpose of building socialism. The Stakhanovite movement was named after coal miner Aleksei Stakhanov, who had been reported to have mined more than 100 tons of coal in under six hours, in effect going 14 times over his quota. By adopting what were deemed by Soviet leaders to be capitalist time-and-motion methods of industrial productivity and efficiency and by raising expectations of worker output, Soviet authorities sought to catch up with the West by instilling Stakhanovite values in Soviet workers.

The CPSU, motivated by the success of the Stakhanovite movement in the coal industry and composed by workers who went over government prescribed quotas, quickly implemented it in other industrial sectors such as steel, railroad, and agriculture, among others. In November 1935 the First All-Union Stakhanovite Conference was held at the Kremlin. Soviet officials emphasized the central significance of the Stakhanovite movement in the socialist reconstruc-

Alexis Stakhanov, Soviet labor leader of the 1930s, whose exploits were set as an unrealistic example for Soviet workers to follow. (Library of Congress)

tion of the national economy, particularly the industrial sector. As part of this push, Soviet officials organized meetings, speeches, and award ceremonies in which they handed out medals and prizes in order to provide incentives for Soviet workers, in addition to increased salaries and improved working conditions. In spite of these genuine incentives, the official Soviet Stakhanovite stresses that all Soviet workers should aspire to produce to their full ability in order to help build the socialist state and that such a goal, in and of itself, should be their incentive as good Soviet workers. Soviet authorities reported that during the First Five-Year Plan (1929–1932), industrial labor productivity had only increased 41 percent. In contrast, with the implementation of the Stakhanovite movement across all industrial and agricultural sectors of the economy during the Second Five-Year Plan (1933–1937), productivity allegedly increased more than 80 percent.

Official Soviet propaganda, media, and government-sanctioned cultural programs emphasized the importance of the Stakhanovite movement to the nation's progress. Newspapers, advertisements, and rallies celebrated the achievements of these Soviet heroes, heralded as models for all workers. Stakhanov and other such workers were actively promoted in the press, literature, and film throughout the Soviet Union. The individual achievements of Stakhanovites were in some cases set by Soviet authorities as acceptable

➤ WRECKERS—ALLEGATIONS OF SABOTAGE IN SOVIET INDUSTRY

State-sanctioned terror was a major aspect of Soviet industrialization in the 1930s. While the Soviet authorities were keen on providing incentives for industrial workers to exceed their quotas, they did not take kindly to those who did not (or could not). Industries where growth was not evident were purged of managers and engineers, and its workers were labeled as wreckers (saboteurs). These alleged wreckers were coerced by Soviet police to confess to working with internal or external enemies to undermine Soviet industrialization, when, in fact, many of them were working with inadequate resources to meet unreasonable quotas. Many

individuals avoided being accused of wrecking by “cooking the books” to avoid being sent to Siberia or worse. The scare tactics utilized by Soviet authorities in order to ensure high productivity inadvertently led to fraud and corruption by individuals who knew what their fate would be if they did not produce according to plan quotas. At the same time, the Soviet state removed highly skilled and motivated individuals from industry and shifted them to work in forced-labor camps, in turn affecting the efficiency of sectors that could have used the talents of these skilled professionals.

—Abraham O. Mendoza

quota levels for all workers, thereby raising the bar on already unrealistic worker quotas. However, the Stakhanovite movement was largely a propaganda tactic on the part of the Soviet government. Contemporary historical research has found that worker productivity in many Soviet heavy industries (steel, coal, and machinery manufacturing) actually increased when adequate working conditions and proper equipment were provided by state industries. The unrealistic goals set by the Stakhanovite movement, while motivating certain individuals to exceed their own personal productivity quotas, was more or less ig-

nored by the mass of workers who produced according to realistic expectations given their own particular circumstances.

War and Diplomacy

In October 1925 the former major European belligerents of World War I negotiated the Locarno Treaties in Locarno, Switzerland. By December 1, 1925, Britain, France, and Germany formally signed these treaties, guaranteeing Germany's western borders and leaving its eastern borders open for later revision. Locarno was an attempt by German foreign minister Gustav Stresemann and French foreign minister Aristide Briand to alleviate diplomatic tensions regarding the controversial Treaty of Versailles (1919) in Europe. Locarno was part of a greater strategy on the part of Stresemann to negotiate peace with France and Britain; following the 1923 French occupation of the Ruhr over unpaid reparations, Stresemann also sought to slowly negotiate the revision of Germany's eastern borders with Poland and Czechoslovakia, which held huge swaths of prewar German territory as well as large populations of ethnic Germans. The Locarno Treaties were the high point of interwar diplomacy in Europe, given that prior to their negotiation Germany was saddled with a huge reparations bill amid a sagging economy and the constant threat of invasion. The Locarno Treaties were regarded as the centerpiece of the improved west European diplomatic climate of 1924–1930, introducing optimism for international peace and stability, typically referred to as the “spirit of Locarno.” Germany's admission to the League of Nations, the international organization established by the Treaty of Versailles to ensure cooperation and stability, and the withdrawal of Allied troops from German Rhineland emphasized the spirit of Locarno. Stresemann and Briand's attempts, however, were short-lived; in the 1930s tensions increased between France and Germany and rapidly eroded the spirit of Locarno. This was indicative of the fact that during much of this period, warfare trumped diplomacy.

International relations from 1900 through 1945 were characterized by the balance of power of the European Great Powers as well as the emergence of the United States and Japan, shaped by their industrial capacity, colonial possessions, and accumulated wealth. By 1945 both world wars had severely depleted Europe's capacity, ebbing the primacy of its hegemony in global affairs and setting the stage for the emergent bipolar confrontation between the United States and the Soviet Union that would characterize much of the post-1945 period of world history. European rivalries had ultimately led to the outbreak of World War I, which affected mostly Eurasia in terms of actual warfare but nonetheless generated economic and ideological repercussions felt the world over. While Locarno was an instance of attempts to quell the immediate tensions created after World War I in Europe, attempts by Germany, Italy, and Japan to revise their borders at the expense of their neighbors severely affected any chances for diplomatic stability during the interwar period.

Britain and France, under the auspices of the League of Nations, attempted to engage the revisionist policies of Germany, Italy, and Japan through policies of appeasement. Fears over the potential of revolution, stemming from the newly created Soviet Union, shaped Britain's and France's reluctance to eliminate growing German power in the continent. Japan, driven to expand in eastern Asia, was also allowed to proceed largely unimpeded, despite strong protests in the League of Nations and the threat of sanctions. The Soviet Union, through its nonbelligerence pacts with both Japan and Germany, stood on the sidelines until German aggression in 1941 forced the Soviets to decide in favor of the Allies.

Other conflicts, such as the Russian Civil War, the Mexican Revolution, the Spanish Civil War, and the Chinese Civil War, that were fought to dislodge authoritarian elites also marked this period. While smaller in scale than the world wars, they left many dead. Moreover, colonial rebellions in the Middle East, Africa, and Asia, while "pacified" by colonial powers, were indicative of growing nationalist movements for independence. However, these were often met with brutal retribution by colonial occupiers, as illustrated through actions by American forces in the Philippine-American War (1899–1904), by German forces in the Herero genocide in German Southwest Africa (1904–1907), and by British forces in the Anglo-Boer War (1899–1902). However, in the context of the world wars, these conflicts were significantly minor, given the larger scope, scale, and amount of forces deployed to engage across vast fronts in the world wars.

From 1900 to 1914 German diplomacy was guided by the desire to counter French ambitions to retain its lost territories of Alsace-Lorraine

and to check British global power. German kaiser Wilhelm II desired to find Germany a “place in the sun” and embarked on a *Weltpolitik*, or world policy. Despite diplomatic provocations and saber rattling, Britain, France, Austria-Hungary, Russia, and Italy maintained nominal stability through the balance of power that characterized the international relations in Europe. The balance of power international system was understood to maintain stability, given that due to the matched resources and strength of the alliances of European powers a major conflict could be prevented and negotiations would inevitably ensue, thus eliminating the potential of warfare. However, this very policy of balance of power allowed for the establishment of two immense alliance blocs: the Triple Alliance (Germany, Austria-Hungary, and Italy) and the Triple Entente (Britain, France, and Russia). Moreover, small-scale wars in the Balkans brought individual members of these blocs into conflict.

Austria-Hungary’s relations with its Balkan neighbors had been tense during the first decade of the twentieth century, given increased Slavic nationalism and the Balkan Wars in the region. Russian Pan-Slavic solidarity with Serbia ultimately became the initial trigger of World War I after Serbian nationalist Garvilo Princip shot Austrian archduke Franz Ferdinand on June 28, 1914. Austria had preemptively annexed Bosnia-Herzegovina, populated primarily by ethnic Serbs in 1878, and was convinced that Princip was acting on behalf of the Serbian government. Within the next month the Triple Alliance and the Triple Entente engaged in hasty exchanges and provocations. Understanding the affinity between the Slavic Russians and Serbs, Austria obtained German support for its demands, most notably the infamous “blank check,” agreeing to Austria-Hungary’s demands for restitution from Serbia after the assassination. By August 1 after Russia began partial mobilization of troops, Germany declared war on Russia and then France in order to enact the Schliffen Plan and defeat France first. The Schliffen Plan dictated that the German Army should defeat France before Russian forces could be ready to engage in actual combat. Through its invasion of Belgium, as dictated by the Schliffen Plan, Germany drew into the war Britain, which had upheld Belgian neutrality. Italy remained neutral until it switched sides and joined the Allies in 1917. The Ottoman empire joined Germany and Austria-Hungary against the Triple Entente, thus forming the Central Powers.

Most of the world remained unscathed by the ensuing conflict on the European continent and in the Middle East. Nonetheless, the immensity of the war, characterized by the trench warfare of the western front with its large-scale infantry attacks, artillery barrages, gas attacks, and hundreds of thousands of deaths, horrified the public. In 1917 the entry of the United States and the exit of Bolshevik-dominated Russia in the midst of the Russian Revolution changed the course of the war. By 1918 Germany signed an armistice with the understanding that the

The balance of power international system was understood to maintain stability, given that due to the matched resources and strength of the alliances of European powers a major conflict could be prevented and negotiations would inevitably ensue, thus eliminating the potential of warfare.

Allied Powers and the Associated Power, the United States, would respect its interests under the guidelines President Woodrow Wilson earlier had enunciated, known as the Fourteen Points. Rather than negotiate with the Central Powers, the Allies imposed the Treaty of Versailles as well as other treaties that severely punished the former belligerents. Other world powers and colonial possessions were not allowed concessions that met their expectations for their participation, despite the Wilsonian rhetoric of national self-determination. Moreover, Britain and France were able to attain German and Ottoman possessions in the Middle East through the auspices of the newly established League of Nations as “mandates,” a euphemism for colonies. India, China, and Japan, despite their contributions to the Allied war effort as combatants, were denied concessions in the form of either territory or sovereignty.

Notions of collective security and a diplomatic policy of appeasement characterized international relations of the interwar period (1919–1939). If a belligerent attempted to threaten the international order, the League of Nations would resort to a policy of economic sanctions and, if necessary, armed force to restore order. Cooperation between the major powers upholding the League of Nations was absolutely necessary for collective security to function. Despite initial attempts to alleviate tensions, such as the Locarno Treaties, the emergence of National Socialism in Germany, along with other fascist movements in Europe, and Japanese aggression in China eliminated possibilities for more conciliatory diplomatic policies. The economic dislocations brought on by the Great Depression in Britain and France and the increasing expansionist drive by Germany, Italy, and Japan further undermined this policy. Moreover, the reluctance of the United States to get involved in European affairs and British and French suspicions of the expansionist ambitions of the Soviet Union further weakened the ability to mobilize any efforts of this sort. France would not act without British support, while the British were adopting a very conciliatory approach because of the need for economic austerity to meet the demands of maintaining the British empire. As a result, Germany, Italy, and Japan were given rein to expand under their respective ideology-driven political systems, often met only with strong words and the empty threat of sanctions.

The German annexation of Austria and the seizure of the Sudetenland from Czechoslovakia in 1938 were met by British and French appeasement. Similar incursions by Japan in Manchuria in 1931 and Italy in Ethiopia in 1935 were also permitted. Soviet fears of German expansion made the Soviet Union an advocate of collective security but it gradually became disillusioned by British and French appeasement and amenable to conciliation with the revisionist powers. As a result, the Soviet Union signed nonaggression pacts with both Germany (1939) and Japan (1941), much to the consternation of the rest of the world.

The establishment of the Rome-Berlin Axis in 1936 cemented German and Italian ambitions for expansion within Europe. Japan joined the Axis first through the Anti-Comintern Pact of 1936, signed with Germany against the Soviet Union, and then with both Germany and Italy with the Tripartite Pact of 1939. Axis expansionist foreign policy, particularly that of Germany and Japan, was fueled by their respective

ideological movements to establish hegemony over their neighbors. Nazi Germany sought to establish the Third Reich over Eurasia and Africa and eventually the Americas, and Japan sought to create the Greater East Asian Co-Prosperty Sphere over eastern Asia, Southeast Asia, and Oceania. Both Germany and Japan possessed racist ideological systems that designated peoples not of those countries' particular racial groups as outcasts to be used as slave labor. Within the Nazi worldview, Jews, Slavs, blacks, and other "undesirables" were to be used as forced labor in the creation of their empire, with little to no regard to their lives. With the implementation of the Final Solution, Germany sought to remove the Jews from Europe through extermination rather than through mere forced migration. Germany also sought to eliminate the Soviet Union, which they regarded as an ideological threat to National Socialism and the German people as well as a tool of "World Jewry." In their efforts to present Britain, France, the United States, and their allies as decadent "bourgeois" powers, the Axis appealed to the nationalist movements of the colonial world, promising liberation and autonomy via a new world order. However, the reality was starkly different, as people of color were designated racial inferiors, subject to the potential of slavery or genocide in an Axis-dominated world. This eliminated the initial prospect of Axis armies as being forces of liberation.

In their efforts to present Britain, France, the United States, and their allies as decadent "bourgeois" powers, the Axis appealed to the nationalist movements of the colonial world, promising liberation and autonomy via a new world order.

Axis advances and Allied losses initially characterized the outbreak of World War II in Asia in 1937 and in Europe in 1939. By 1940 both Germany and Japan were at the height of their strength in terms of territorial advances and military output, as the Allies were on the retreat along all fronts. However, the German attack on the Soviet Union and the Japanese attack on the United States in 1941 brought those two major powers into the war, drastically changing the nature of the conflict. Both the United States and the Soviet Union, despite initial losses, were able to mobilize massive war matériel, manpower, and labor to counter dwindling Axis resources. Britain was also able to muster its own national resources and those of the British commonwealth, which included British colonies in Africa and southern Asia as well as the British dominions of Canada, Australia, New Zealand, and South Africa. However, the war matériel production of Britain, China, Canada, Australia, and other Allied contingents was dwarfed by the output of the United States and the Soviet Union; this advantage in matériel made possible the breakthroughs in both the European/north African and Asia/Pacific theaters of operations.

The Grand Alliance, dominated by Britain, the United States, and the Soviet Union, launched a coordinated effort, established at the Yalta Conference of early 1945, to defeat the Axis Powers. Moreover, nationalist movements in Axis-dominated territories, such as France, Poland, Yugoslavia, the Philippines, and Vietnam, fought guerrilla wars against their German and Japanese oppressors. Despite German and Japanese

last-ditch efforts to fight to the bitter end (Italy dropped out and switched sides in 1944), the Axis Powers were ultimately defeated in 1945.

The years of war destroyed much of Europe. In the aftermath of the war, Europe's people were impoverished and dependent on American and Soviet troops for their sustenance. The U.S.-sponsored Marshall Plan, which infused billions of dollars to rebuild western Europe, is the most notable example of European dependence on outside assistance. Both Germany and Japan were occupied by large Allied armies, subject to the beneficence of their former enemies after surrender. In particular, Japan was occupied by U.S. forces under General Douglas MacArthur, who established a new Japanese constitution minimizing the role of the emperor as a figurehead. Britain, once the world's premier superpower, was financially ruined, and its international position was reduced. France also felt its new relative position in international affairs diminished amid the emergence of both the United States and the Soviet Union as the arbiters of global diplomacy. Moreover, nationalist movements in southern Asia, sub-Saharan Africa, and Asia were emboldened by the decline of European hegemony and actively sought independence in the last year of the war. In essence, 1945 marked the end of European hegemony and the beginning of the process of decolonization and presaged the eventual establishment of a bipolar international system in 1947.

■ Introduction: Revolutions

Political and social revolutions from 1900 to 1945 were frequently violent forms of resistance against existing political authorities and institutions. Such revolutions were attempts to either remove the existing regime in control of the state or remove a foreign colonial authority in order to replace it with an indigenous nationalist state. In either instance, violent resistance was a common means that was employed, as in the Bolshevik Revolution against the Russian Provisional Government, the Irish Rebellion against British rule, and the Young Turks movement that led to revolt in the late Ottoman empire. However, in other instances non-violent means of resistance, such as in the Quit India movement, were also seized upon as in order to instigate social change and remove an unwanted colonial authority.

—*Abraham O. Mendoza*

The Young Turks

The Young Turks, known as the Committee for Union and Progress (CUP), were the most successful of the various reformist groups that emerged in the Ottoman empire as a response to the Islam-backed autocracy of Sultan Abdulhamid (r. 1876–1909). Founded in 1894, CUP was originally a collection of diverse groups united primarily by their opposition to Abdulhamid. However, CUP was soon taken over by a Turk-dominated group led by Ahmed Riza that sought to create a unified state on the basis of Turkish, and Muslim, dominance. Although CUP and similar organizations were initially suppressed, by 1906 the failures of Abdulhamid's government to suppress rebellions in Anatolia and Armenia led to the emergence of CUP in Thessalonika. The reform movement grew in strength and in

July 1908 forced Abdulhamid to restore the Constitution. The Sultan's supporters retaliated, but after their counter coup was put down on March 31, 1909, CUP deposed Abdulhamid, replacing him with his brother Mehmed V.

Although CUP had begun as a reformist movement, it proved to have no interest in relinquishing power to either Parliament or the sultan, and resorted to dominating events behind the scenes. CUP's policies included centralization of power, modernization, opposition to foreign domination, and the favoring of the Turkish minority within the empire. (Turks consisted of 40 percent of the Ottoman population until the Balkan Wars in 1912–1913.) This Turkish preference eventually pushed the Albanian, Arab, Armenian, and other minorities to demand autonomy in increasingly strident terms, leading to Albania's breaking away in the First Balkan War (1912–1913) and, most tragically, the Armenian Massacres (1915–1919). Despite CUP's repression of the Arabs within the empire, during World War I most Arabs remained loyal to the sultan and Islam against Christian Britain.

CUP was unable to maintain the integrity of the empire any better than had Abdulhamid. They lost Libya to the Italians and the entirety of Ottoman Balkan possessions except eastern Thrace (the part of modern Turkey that lies in Europe). After 1913 the CUP government came under the control of three charismatic men, Enver Pasha, Talaat Bey, and Djemal Pasha. Enver, educated at the German War College, became minister of war shortly before World War I; Talaat became minister of the interior; and Djemal was military governor of Constantinople. Enver's pro-German orientation combined with Britain's dismissive policy toward the Ottomans led the empire to join World War I on the German side. Neither Enver nor Djemal were skilled military leaders; Enver led a series of disastrous expeditions against Russia in the Caucasus, while Djemal decisively failed to conquer Egypt in 1915.

After the Ottoman empire's defeat in World War I, Enver, Talaat, and Djemal fled to Berlin, and CUP was removed from power. Although the Young Turk era was over, their influence did not end. After the publication of the punitive Treaty of Sevres in 1920, former CUP member

➤ ATATURK

Mustafa Kemal (1881–1938) was the founder of modern Turkey. Born in modern Thessaloniki, he became an army officer and a member of the Committee for Union and Progress. His first great achievement was at Gallipoli (1915), when his forces shocked the world by defeating the British. After the partition of the Ottoman empire (1920), Kemal raised a national army and won Turkish independence in a campaign culminating in the tragic sack of the cosmopolitan city of Smyrna (now Izmir), which included violence against its large Christian population of Greeks and destruction of many of its buildings in 1922. He forged a nationalist and secular state, earning for himself the title Ataturk ("Father of the Turks"), and reestablished relations with Britain and France while following a policy of strict neutrality. Kemal's efforts to forge a secular Turkey remain a legacy to this day.

—Jesse Ravage

Mustafa Kemal fled to Anatolia and raised the banner of a new secular Turkish state.

The Bolshevik Revolution

The revolution of February 1917, which overthrew the Romanov dynasty in the Russian Empire, reflected the deep-seated animosity of many groups in Russia against the old dynastic order, especially its conduct during World War I. However, these groups did not agree on what type of government should take its place. This was reflected in the system of dual power that sprang up in the first days of the revolution. On the one side, members of the Duma, a quasi-parliamentary body composed primarily of representatives of

the privileged classes such as nobility, professionals, and urban middle classes, created the Provisional Government that was dominated, at least initially, by moderate liberals. On the other side, the lower classes, principally industrial workers, soldiers, and peasants, set up local grassroots organizations or councils known as soviets to represent and protect their interests. The existence of the soviets reflected the distrust that the masses felt for the parties and politicians in the Provisional Government.

The policies of the Provisional Government over the next few months only exacerbated the distrust of large numbers of soldiers, peasants, and workers toward the government and ultimately led many of them to oppose it actively. The most fateful policy, of course, was the decision to remain in the war, which meant that the suffering of the preceding years would continue. While not necessarily opposed to the war in principle, many among the lower classes hoped that the new government would conduct it more effectively and minimize, or at least equally distribute, the burdens. The abject failure of the government's new offensive in June–July 1917 resulted in a massive loss of faith in the government among soldiers. Tens of thousands of soldiers began to desert every week, while those who remained were often distrustful of officers and openly disobedient.

Similarly, the government's decision to delay any significant land reform until after the end of the war produced widespread anger and disobedience in the countryside. Moreover, as it became clear that the government had few reliable troops to deploy against them, large numbers of peasants began to seize the land, crops, livestock, and property from private estates. While peasant disturbances began as early as May 1917 in some areas, they became increasingly widespread and violent as summer gave way to autumn.

Last but not least, the government proved unable to alleviate, let alone improve, the living and working conditions of most urban workers. As railroads and other transportation infrastructure broke down, many factories began to shut down or reduce production because of shortages of fuel and raw materials, threatening more and more workers with unemployment. Efforts by workers to protect their interests through

strikes or workers' control were often met by lockouts. The brief era of goodwill during the spring of 1917 gave way to a growing spirit of class war in the summer and autumn.

Although the political composition of the Provisional Government underwent a number of changes in the spring and summer of 1917, as moderate socialists joined in an effort to make it more broadly representative, this did little to help its popularity. Moderate socialists fatally underestimated the forces radicalizing lower-class opinion and the impatience of soldiers, workers, and peasants for change. Indeed, it was only the Bolsheviks who captured the mood of the masses and were able to channel it for their own purposes.

Much of the credit for this, of course, was due to the leadership of Vladimir Lenin, who pushed other Bolshevik leaders to pursue a revolutionary course. Shortly after returning from exile, he announced his famous April Theses and was able to get these adopted as official party policy. The April Theses rejected any support for or cooperation with the Provisional Government, calling instead for "Peace, Land, Bread" and "All Power to the Soviets." Such slogans struck a responsive chord with the increasingly militant masses, and by the summer of 1917 Bolshevik support in local soviets, factory councils, and soldiers committees was increasingly evident, while party membership had begun to grow rapidly. Although precise figures are sketchy, reliable estimates suggest that total party membership rose from about 10,000 in February to more than 100,000 in July and perhaps more than 250,000 by October.

The so-called July Days revealed the success of the Bolsheviks in tapping into the mood of the masses. On July 16 hundreds of thousands of soldiers, sailors, and workers, many of them chanting or carrying banners with Bolshevik slogans, took to the streets in Petrograd demanding a new government based on the soviets. After two days, though, the protests collapsed, and in the subsequent weeks the government moved to suppress both popular militancy and the Bolsheviks. However, the apparent collapse of the Radical Left inspired antisocialist groups to mobilize and support efforts to create a military dictatorship that would restore law and order. These efforts

culminated in the Kornilov coup in late August when the new commander of the army, General Lavr Georgiyevich Kornilov (1870–1918), sent troops to impose martial law in Petrograd (St. Petersburg). The Bolsheviks played a crucial role in mobilizing and organizing armed opposition to the coup.

The abortive coup helped revive the Bolshevik fortunes after the setback of the July Days. In particular, the coup solidified the Bolsheviks' image as the most dedicated defenders of the revolution and helped them secure control of the soviets in Petrograd, Moscow, and several other large cities in September and early October. Convinced that the time was now ripe, Lenin pressed the party's Central Committee to seize power as soon as it became practical. After considerable hesitation and debate, in early October the leadership directed Leon Trotsky (1879–1940), the new chairman of the Petrograd Soviet, to organize a seizure of power that would coincide with the meeting of the Second All-Russian Congress of Soviets in whose name the takeover was to take place. The actual revolt occurred on October 25 and proceeded with little bloodshed, a testimony to the extent to which the Provisional Government had lost legitimacy and the willingness, at least temporarily, of many lower-class Russians to support the Bolsheviks.

Eire—The Republic of Ireland

Eire, also known as the Republic of Ireland, began the twentieth century as part of the British empire. In the late nineteenth century, anti-British sentiment and Irish nationalism had led to a renewal of cultural and nationalist rhetoric.

Ireland's move toward freedom from England became militarized with the creation in 1913 of two nationalist armies: the Irish Volunteers and the Irish Citizen Army.

The Irish Volunteers, originally under the leadership of John Redmond, divided over the issue of World War I. Redmond committed the Irish Volunteers to fight in the war in the belief that England would grant Ireland political freedom if Ireland fought for Britain in the conflict. However, many nationalists of the Irish Volunteers refused to fight due to anti-English sentiment and their desire to remain outside of what they perceived to be an imperialist cause. For this reason, many British officials perceived the Irish to be on Germany's side, although they were actually neutral.

Hoping to catch the British off guard, Nationalists launched a rising (rebellion) during Easter Week of 1916. While Dublin was the epicenter of the Easter Rising, several other counties also witnessed rebellions. The English overreacted to the rising, overtook the city with brute force, and executed the leaders. While some countries, particularly the United States, had groups that sympathized with the Irish cause, other nations refused to interfere on Ireland's behalf, fearing that doing so might destroy alliances with England.

After the Easter Rising, Irish nationalists used the outrageous prison conditions and the nature of the executions as nationalist propaganda, gaining strength for their cause within the country as well as abroad. Nationalism in Ireland finally led to a guerrilla war fought against English authorities in Ireland. This war, which is referred to as the Anglo-Irish War or the Irish War of Independence, took place during 1919–1921. The war grew out of Irish nationalist propagandists' activities in the aftermath of the Easter Rising, which included pamphlet campaigns and international speaking tours. These activities slowly led into strikes against British authorities and the execution of intelligence agents who worked for Dublin Castle. A critical event was Bloody Sunday on November 21, 1920, when Michael Collins ordered the assassination of British agents in Dublin, successfully killed 14, and triggered a reprisal in which British soldiers killed numerous participants at a football match, including one player.

➤ MICHAEL COLLINS

Michael Collins was an Irish republican and a patriarch of the Irish Free State. Born in 1890 in County Cork, Collins became political after moving to London in 1906 where he joined a secret society known as the Irish Republican Brotherhood. From that point on he devoted himself to Irish independence. In 1916 he returned to his homeland only to be imprisoned for his participation in the Easter Rebellion. Upon his release he rose to prominence as head of the military arm of Sinn Féin and director of intelligence for the Irish Republican Army. In December 1921 Collins accepted a treaty with the British government that, while falling short of outright independence, was viewed as a step toward a free Ireland. The signing of the treaty split Irish republicans into two camps and sparked the Irish Civil War. Collins and the government of the Irish Free State were pitted against republican rebels led by Eamon de Valera, a former compatriot of Collins and fellow leader of Sinn Féin. Collins was assassinated in an ambush on August 22, 1922.

Michael Collins acted on behalf of Irish independence as the military leader of Sinn Féin, but it was as Director of Intelligence of the Irish Republican Army that he became famous. (Library of Congress)

Bibliography

“Michael Collins,” *World History: The Modern Era* (Santa Barbara, CA: ABC-CLIO), <http://www.worldhistory.abc-clio.com>.

The British responded to Irish disobedience with harsh measures, most notably the involvement of its paramilitary troops/police force, the Black and Tans. Between 1920 and 1921 these troops would burn Irish homes (and the city of Cork), shoot citizens and guerrillas alike, and torture women and men whom they believed held the slightest sympathy with the Irish cause. The Irish Republican Army (IRA), formerly the Irish Volunteers, under the leadership of Collins took drastic measures to level the battlefield. IRA members were vastly outnumbered, and Collins realized that the only way to beat the British was to begin ambushing and killing British intelligence agents and other leaders, one by one. Many of these men would be shot in their homes, as would many of the IRA men. In the end Collins forced the British into a stalemate, and they signed the Anglo-Irish Treaty in December 1921.

The final terms of the Anglo-Irish Treaty gave Ireland dominion status, very similar to that of Canada. However, the treaty also allowed Northern Ireland to opt out of this arrangement

and remain directly under British control; six of Northern Ireland's nine counties voted to do this (although these acts only passed by slender margins, which led to great violence in the northern countries). Another grievance of many Irish nationalists with the treaty was its requirement that all members of the Dail Eireann (Irish Parliament) take an oath of allegiance to Great Britain.

The heated debates surrounding the treaty led to the factioning of the IRA into Pro-Treaty and Anti-Treaty sides and also led to the Irish Civil War. In 1922 and 1923 Eamon de Valera led the Anti-Treaty IRA against Collins and the troops of the new Irish Free State. The Free State's methods for crushing the IRA's resistance were brutal due to fears that rebellion in the early years of the new nation would cause it to falter, making the British reassume direct control over the country. Collins was killed in 1922 during these skirmishes.

During the period 1923 to 1949 the Irish Free State continued to be wrecked by discon-

tent and sporadic acts of violence. There were still many Irish who wished for complete Irish independence, and a great deal of infighting took place between Irish politicians over issues of the state. De Valera, who had led the Anti Free State IRA in the Irish Civil War, came into power in the Free State in 1932. He became heavily invested in restoring the Irishness of Ireland and issued a new constitution for Ireland in 1937. Through this new constitution, the name of the nation was changed to Eire, or Ireland. However, de Valera refused to ask for Irish independence from the British commonwealth.

During World War II, Eire was the only British commonwealth nation to remain neutral throughout the entire conflict due to great political and nationalist divides present in the country at the time. In fact, Ireland avoided direct references to “World War II,” instead calling it “The Emergency.” Even after Dublin was bombed by German forces in 1941 (supposedly by accident, although it has been claimed that this was really a warning not to become involved), neutrality was maintained. Northern Ireland, however, as part of the United Kingdom, was heavily involved in the war.

Following the war, many nations began to gain their freedom from imperial governments. In 1948 when John A. Costello defeated de Valera in the Irish elections, the Irish government demanded its complete independence. On April 18, 1949, Ireland withdrew from the British commonwealth and since then has enjoyed its status as a republic. This status has kept the Irish Republic relatively free of the fighting experienced in the northern counties.

The Mexican Revolution (1910–1920)

The Mexican Revolution (1910–1920) ravaged the nation, costing an estimated 1 million lives, more than 6 percent of the population, and setting the country back economically for decades. It was the consequence of the growing social and political unrest that accompanied the dictatorial regime during 1876–1911 of Porfirio Díaz (1830–1915).

Díaz’s refusal to allow free elections in the 1910 election, although he had stated that Mexico was ready for them in an 1908 interview, sparked the beginnings of the revolution. Díaz arrested his chief political opponent, Francisco Madero, just before the election, ensuring that Díaz would continue to rule the country for another presidential term. Although Madero was released following the election, the damage had been done. Madero and his followers launched their revolution in October 1910 with the issuance of the *Plan de San Luis de Potosí* (Plan of St. Louis of Potosí) manifesto calling for the violent overthrow of the Díaz regime. Díaz attempted to resist, but faced with pressure from revolutionaries in the south (led by Emiliano Zapata) and in the north (led by Francisco Madero, Pascual Orozco, and Pancho Villa), the Porfiriato (reign of Porfirio Díaz) came to an end, and the aged dictator fled to exile in France.

Although Madero assumed the presidency, the country was far from unified. Madero, while more progressive than Díaz, was far from being a revolutionary. Madero was unable to prevent Orozco from turning against him in the state of Chihuahua, and the more radical peasant movements led by Zapata distrusted Madero, who had failed to deliver on his promise of land reform. Madero’s forces, commanded by Victoriano C. Huerta, defeated Orozco at Rellano and Ciudad Juárez and relentlessly drove him across Chihuahua.

Madero also faced opposition from the conservative elites who yearned to stop even his minor reforms. General Bernardo Reyes and General Félix Díaz, the nephew of the fallen dictator, headed the attempts to restore conservative rule in the country. After Reyes was defeated in the 1911 election, he and Félix Díaz each separately attempted to foment a revolt. After both attempts

➤ PANCHO VILLA'S NEW MEXICO RAID

In January 1916 an officer in the service of Francisco Pancho Villa stopped a mining train in Santa Isabel, Chihuahua, and 17 American mining engineers on board were summarily shot on the spot. Villa subsequently marched his troops to the U.S. border, just outside Columbus, New Mexico, and on March 4, 1916, in the predawn hours, approximately 400 mounted Mexicans crossed the border and began an assault on the town. One detachment struck the town itself, while another sought to eliminate the threat posed by the U.S. military garrison there. (The Mexicans mistakenly believed that the town was held by about 50 U.S. soldiers, when in fact around 600 were present.) Although surprised, the U.S. troops quickly set up their machine-gun units and began to rake the Villista troops with withering fire. Villa's detachment in the town indiscriminately shot civilians and set fire to buildings until being forced to retreat by the garrison troops arriving in the town. Three hours after the assault began, Villa's troops withdrew in the face of superior American firepower. Seventeen Americans, most of them civilians, had been killed in the fight, but more than 100 of Villa's men were killed, or more than 25 percent of his invading force.

—Gerrit Dirkmaat

(Library of Congress)

failed and the men were jailed, the determination was made to lead a counterrevolution by the use of a coup. They enlisted the support of Madero's victorious general, Huerta, who turned on Madero and had him brutally murdered in 1912. Huerta assumed command of the country himself, much to the pleasure of the conservative elements both in and out of the country.

Huerta quickly sought to consolidate his power, strengthen the federal military, and quash any rivals. Kidnappings, murders, and even the dissolution of the Mexican Congress followed. Although most foreign governments quickly recognized the regime that pledged to honor foreign property rights, U.S. president Woodrow Wilson refused to do so. Wilson wanted to aid the forces fighting against the Huerta government and negotiated with the leader of the anti-Huerta forces, Venustiano Carranza. The nationalistic Carranza

shunned any such alliance with the United States, but Wilson nonetheless occupied Veracruz and placed an arms embargo on the Huerta regime while still allowing arms shipments to cross the northern border, fueling the efforts of men such as Pancho Villa.

The Huerta government soon found itself caught in a pincer movement. Zapata was advancing from the south, General Alvaro Obregón was bearing down on Mexico City in Jalisco from the west, Americans had cut off his arms imports and custom revenues in the port city of Veracruz to the east, and Pancho Villa had captured the last federal stronghold in the north, Zacatecas, in an overwhelming victory. Sensing that the end was near, Huerta abandoned the capital and exiled himself to Spain, leaving the revolutionaries to haggle over who should now rightly rule the country. Zapata and Villa both represented the

more revolutionary ideals, such as land redistribution, but Obregón and Carranza had much more political savvy as well as greater ties to the middle class. While Zapata and Villa were powerful regional revolutionaries, neither man seemed able to forge a national coalition. For short periods of time Carranza, Villa, and Zapata each occupied Mexico City with their forces. Many thought that Villa's larger force and popular appeal would win the day, but he failed to press home his advantage after Carranza and Obregón fled to Veracruz, having been recently abandoned by the occupying American forces. The shrewd Carranza led the Constitutionalist forces, a broad-based national coalition of anti-Huerta elements, in efforts to consolidate power nationally, while Obregón marched northward for a final confrontation with Villa in early 1915.

The showdown that took place at Celaya as well as the successive battles that followed routed Villa and gave de facto control of the government to Carranza. Villa underestimated the accomplished tactician and strategist Obregón and, on several occasions, imprudently charged the lines of the Constitutionalist forces. The U.S. government had allowed one Constitutionalist general, Plutarco Elías Calles, to reinforce with troops and supplies that crossed U.S. territory, leading to Villa's defeat at Agua Prieta. Reacting to the apparent U.S. support of the Carranza government, Villa raided Columbus, New Mexico. Wilson dispatched U.S. troops to Mexico to punish Villa; however, the Americans left with little success by January 1917 in the face of impending U.S. intervention in Europe.

Carranza and his supporters drafted a new Constitution in 1917, one that gave the government power to displace foreign economic interests as it saw fit. Carranza, however, did not deliver on the promise of land redistribution, making only a few localized efforts to give the appearance of such agrarian reforms. Obregón, who was the real hero of Mexico for his famous battlefield victories, decided to face off against the Carranza regime and his old ally in the 1920 presidential campaign. Carranza attempted to strong arm the mounting opposition and, seeing the unstoppable support for Obregón, fled to Veracruz with hopes of again establishing a power base there with which to contend against Obregón, much as he

had done against Villa in 1915. Unfortunately for Carranza, he was intercepted by forces loyal to Felix Díaz en route and was killed as he slept.

Obregón now assumed almost total control of the country, giving it more stability than it had enjoyed for almost a decade. He judiciously instituted measured land distribution in the areas that were most in need of it, but he did not turn wholesale against the upper classes as some revolutionaries had hoped. He sought to create a delicate balance between the resources and political influence needed from the upper classes and the popular support vital from the lower classes. Zapata had already been assassinated by Constitutionalist forces in 1919, and Villa was forced into retirement. Villa's overwhelming popularity was considered just too dangerous to the Obregón government, and his lieutenants conspired to murder the volatile Villa in an ambush in 1923.

Although there was still instability following the Obregón presidency (1920–1924) in the form of local revolts and the Cristero Rebellion (1926) that pitted pro-Catholic forces against the rising tide of anticlerical sentiment and enactments coming from the secularizing federal government, the most unstable and bloody times of the Mexican Revolution had come to an end with Obregón's ascendancy. The Mexican Revolution had perhaps fallen short of the goals of many who were seeking a completely transformed state, but it had made an indelible imprint on the psyche of average Mexicans. In the end, many see the Mexican Revolution as, at best, an incomplete movement that left the majority of the Mexican lower classes still deeply divided from the elite upper class.

■ Introduction: International Conflict

During the first half of the twentieth century, the international tensions of the nineteenth century erupted in major warfare. Two of the wars were sufficiently grand in scale to have earned the designation “world wars,” but smaller conflicts broke out on nearly every continent. The Japanese continued their expansion on the East Asian mainland initiated in the Sino-Japanese War (1894–1895) through a war with Russia (1904–1905) over possession of Manchuria and Korea. Other conflicts included a second Boer War in South Africa (1899–1902), and the Balkan Wars (1912–1913). Growing nationalistic sentiment, anti-imperialism, idealized modernism, and industrialism contributed to and connected many of the smaller international conflicts, even though the combatant countries had achieved various levels of industrialization, economic strength, and international power.

Nationalism grew throughout the nineteenth century and peaked by the mid-twentieth century. At the same time, Western imperialism waned. While not newsworthy in the Americas, imperialism’s decline fostered change in new areas, such as Africa and Asia. Ethnic identity unified the masses against the ruling elite and served as a foundation for aggressive nationalism and anti-imperialism. Often, burgeoning nations sought to establish themselves in positions of regional authority in place of recently overthrown Western powers, paradoxically making them anti-imperialistic even as they created their own empires or spheres of influence. Rapid industrialization became a popular method for achieving these goals, as doing so stimulated the economy and promoted nationalism.

Public opinion also played a major role in international conflicts. All combatant countries had to keep public support for war as strong as possible in order to maintain interest in and funding for their war effort. Consequently, massive propaganda campaigns were used to ensure support. Support lessened as wars dragged on without conclusive battles, and public desire to continue fighting flagged, causing public relations crises and rebellion in some cases.

Warfare changed dramatically during the early twentieth century as well. Technological advances rendered traditional tactics and strategies ineffective and inefficient. Firearms became more accurate, durable, and reliable while simultaneously increasing range and rates of fire. Mechanization increased the belligerents’ ability to strike quickly and effectively, thus ending the days of pitched battles of block formations in open fields. The forces most able to maneuver quickly with discipline often won even when facing larger forces using traditional frontal or predictable assaults. Running battles and guerrilla warfare also favored the less technologically-advanced nations in war because they allowed troops to attack at will and rarely give the larger forces a chance to react and mount a counterattack. With such elusive tactics, large, decisive battles became rarer, thus drawing the war effort well beyond the interest of the citizens and the economic power of the government to maintain. International conflicts during this time increased nationalism and political tension while fundamentally altering warfare but resolving little else.

—*Ian Patterson*

Balkan Wars (1912–1913)

The Balkan Wars were two bloody conflicts in southeastern Europe that occurred just prior to World War I. During the nineteenth century, nation-states in southeastern Europe emerged from the weakened structure of the Ottoman empire. These states, including Bulgaria, Greece, Montenegro, and Serbia, all harbored irredentist aspirations against the Ottomans. Many of these aspirations overlapped, especially in Macedonia. For some time, these rivalries precluded the formation of a Balkan alliance. The Young Turk revolution in 1908 in the Ottoman empire and its objective of an Ottoman revival, however, engendered closer cooperation among these Balkan states. An opportunity for the realization of their nationalist objectives arose when the weakness of the Ottomans became apparent during

BALKAN WARS, 1912-1913

the Italo-Turkish War of 1911-1912. As a result of this conflict, the Turks were forced to relinquish territory to Italy. With Russian support, Bulgaria and Serbia signed an alliance in March 1912 that contained provisions for a rough division of Ottoman territories, including a partition of Macedonia into a Bulgarian zone and a contested zone to be arbitrated by the Russian tsar. Bulgaria and Serbia then signed bilateral agreements during the spring and summer of 1912 with Greece and Montenegro, creating the Balkan League.

The fighting began on October 8 between Montenegro and the Ottoman empire. Bulgaria, Greece, and Serbia joined in the war ten days later. Each Balkan ally confronted the common

enemy separately. The most important theater was in Thrace, where a strong Bulgarian offensive overcame Ottoman resistance at Lozengrad and at a massive battle that raged from Buni Hisar to Lyule Burgas. At the same time, the Bulgarians surrounded and besieged the Ottomans at Adrianople. The Bulgarian offensive thrust the Ottomans back to the final defensive positions at Chataldzha, about 20 miles (32 kilometers) outside of Istanbul. Finally, on November 16-17 Ottoman forces rallied to defend their capital against a Bulgarian attack on the Chataldzha lines. Meanwhile, smaller Bulgarian units proceeded into western Thrace and into Salonika.

Elsewhere the Greek Army advanced in two directions against slight opposition. The thrust

► RADOMIR PUTNIK (1847–1917)

The Balkan Wars provided opportunities for some military leaders to develop skills that they later employed during World War I. Among these were Radko Dimitriev, a Bulgarian general who commanded Bulgarians at Lyule Burgas/Buni Hisar and Chataldzha during the Balkan Wars and led Russian armies on the eastern front in World War I, and Mustapha Kemal, an Ottoman lieutenant colonel who defended Gallipoli against the Bulgarians in the Balkan Wars and again against the British during World War I. Prominent among such Balkan War veterans was Serbian Field Marshall (Vojvoda) Radomir Putnik. Born in Kraguevac, Serbia, on January 24, 1847, he participated in fighting in 1876 against the Ottoman empire and in 1885 against Bulgaria. By the time of the Balkan Wars, he was Serbian Army chief of staff. He led the Serbian Army to victories over the Ottomans at Kumanovo in October 1912 and against the Bulgarians at Bregalnitsa in July 1913. Field Marshall Putnik directed the successful Serbian defense against three Austro-Hungarian attacks in the autumn of 1914. An invasion one year later by combined Austrian, Bulgarian, and German armies forced an epic Serbian retreat across the Albanian mountains. By the time Putnik reached the Adriatic Coast, he was seriously ill. Soon afterward he was relieved of command. He died in Nice, France, on May 17, 1917.

(Library of Congress)

moved into Epirus (in northwestern Greece) and besieged the city of Janina. The northeasterly push overran Thessaly and entered Salonika on November 8, only a day ahead of the Bulgarian unit moving south. An uneasy condominium ensued in that city. The Greek Navy held the Ottoman fleet at bay and seized the Aegean Islands of Limnos, Mitylene, and Chios. One section of the Montenegrin Army advanced into the Sandjak of Novibazar, while most of the rest of the Montenegrins besieged the northern Albanian town of Scutari (Shkodër). The main part of the Serbian Army defeated the Ottomans at Kumanovo in

northern Macedonia and then proceeded to take most of the rest of Macedonia. Other Serbian units occupied Kosovo. By the time the warring parties agreed to an armistice on December 3, the only territories in Europe remaining to the Ottomans were the besieged cities of Adrianople, Janina, and Scutari; the Gallipoli peninsula; and that small part of eastern Thrace behind the Chataldzha lines.

While the Balkan allies and the Ottomans assembled in London on December 16 to negotiate a peace settlement, the ambassadors of the Great Powers convened nearby to direct the course of

the peace settlement and to protect their own interests. This ambassadors' conference, on the insistence of Austria-Hungary and Italy, recognized the independence of an Albanian state that some Albanian notables had proclaimed in Vlorë on November 28. This state blocked Serbian and Montenegrin claims to the eastern shore of the Adriatic Sea. The Austrians demanded that Serbian troops evacuate those portions of northern Albania occupied that autumn. The talks between the Balkan allies and the Ottomans soon stalled, mainly over the issue of Adrianople. On February 3, 1913, hostilities resumed.

On March 6 Janina fell to the Greeks. On March 26 the Bulgarians, with Serbian help, took Adrianople. The Montenegrins and assisting Serbian units bogged down around Scutari. Only on April 23, after the departure of the Serbs under Great Power pressure, did the Montenegrins succeed in entering the city. Nevertheless, the Great Powers refused to sanction a Montenegrin occupation of Scutari because the London ambassadors' conference had assigned it to the new Albanian state. Threats and a show of force, together with the promise of generous subsidies, caused the Montenegrins to evacuate their prize. On May 30, 1913, the Balkan allies and the Ottomans signed a peace treaty in London to end the First Balkan War.

By then the loose Balkan alliance was disintegrating. The Serbs sought compensation for Albania in Macedonian areas occupied by Serbia but assigned to Bulgaria by the alliance treaty. The Bulgarians and Greeks skirmished over Macedonia and Salonika. On May 5, 1913, the Greeks and Serbs signed an agreement directed against Bulgaria. A feeble Russian attempt at arbitration in June failed. On the night of June 29–30 the Bulgarians launched probing attacks against Serbian positions in Macedonia. The Greeks and Serbs utilized these attacks to implement their alliance. Greek and Serbian counterattacks forced the Bulgarian troops back. In mid-July, Romanian and Ottoman troops invaded Bulgaria. The Romanians objected to the establishment of a strong Bulgaria on their southern frontier and sought compensation in the Danubian town of Silistra and in southern Dobrudzha. The Ottomans sought to recover Adrianople. The Bulgarians found themselves attacked on all

sides. With no aid forthcoming from any Great Power, the Bulgarians sought terms. In the Treaty of Bucharest (August 10, 1913) with Greece, Montenegro, and Serbia and the Treaty of Constantinople (September 30, 1913) with the Ottoman empire, the Bulgarians acknowledged their total defeat in the Second Balkan War.

The Balkan Wars left a legacy of frustration for the Bulgarians and Ottomans, who both sought redress for their defeats on the side of the Central Powers in World War I. The wars also imparted a sense of inflated success among the Greeks, Romanians, and Serbs. Less than a year after the conclusion of the Treaty of Bucharest, war again erupted in southeastern Europe. During the next five years, all of the participants in the Balkan Wars would become involved in further disastrous and costly conflicts.

The Chaco War (1932–1935)

The Chaco War, fought between the South American states of Bolivia and Paraguay from 1932 to 1935, ranks behind the U.S. Civil War as the second-bloodiest war in the modern history of the Western Hemisphere. The Chaco War was fought for possession of the region known as the Gran Chaco, which covers about 100,000 square miles (260,000 square kilometers) and is a vast forested wasteland with little water and no resources that today comprises most of western Paraguay and part of eastern Bolivia. Although Paraguay ostensibly won the war, both states suffered heavy loss of life and were further impoverished as a result of the conflict.

Paraguay's population in the late 1920s has been estimated at approximately one million. A Spanish-speaking elite governed the country and ruled over an indigenous population of Guaraní Indians. The economy of the country was based primarily on subsistence agriculture. In the War of the Triple Alliance (1865–1870) against Argentina, Brazil, and Uruguay, Paraguay lost huge swaths of territory and almost its entire male population. As a consequence, Paraguay became a country surrounded by hostile neighbors and constantly on the verge of extinction.

Bolivia, on the other hand, had a much larger population of three million. The nation was also primarily indigenous peoples ruled by a Spanish-speaking elite. Subsistence agriculture predominated in the nation, although tin mining had proved an important source of revenue in the 1920s. The worldwide economic depression of the 1930s led to a fall in tin prices, and by 1932 Bolivia was deeply in debt and experiencing declining living standards. Prior to the Chaco War, Bolivia had lost territory through unsuccessful conflicts, suffering defeats by Chile in 1884 and Brazil in 1903. By 1932 the president of Bolivia, Daniel Salamanca, was determined to gain the Gran Chaco for Bolivia.

The Gran Chaco region is best described as a forested wasteland that blends into desert on the western edge. The region had virtually nothing in terms of economic resources, and water was very scarce. During the course of the nineteenth and early twentieth centuries, the border between Bolivia and Paraguay remained rather undefined. The Paraguayans probably had the stronger claim to the region and had settled Canadian Mennonites in the Chaco in the 1920s to strengthen their claim. A theory widely circulated in the 1930s held that the war had been provoked by the American company Standard Oil, which had allegedly encouraged Bolivian aggression in the belief that vast oil reserves could be found in the Gran Chaco, but historians have since discredited that theory.

Border clashes in the late 1920s and early 1930s culminated in full-scale combat on June 15, 1932, when the Bolivians launched an offensive. The war initially proved wildly popular in both countries, with vast crowds at train stations cheering troops departing for the front.

Both governments undertook propaganda campaigns and public fund-raising drives. Bolivia's Salamanca used the war as an opportunity to move against his political opponents by declaring a state of emergency and imprisoning many dissidents, especially members of left-wing groups and trade unions.

The Bolivian offensive quickly stalled, and the Paraguayans moved over to the attack. The Paraguayans were led by General José Félix Estigarribia, a highly competent officer who understood the terrain of the Chaco. At the same time, the Bolivian Army was led by General Hans Kundt, an inept German émigré whose tactics consisted simply of hurling his troops frontally at prepared Paraguayan defensive positions. The Bolivians advanced in predictable patterns down roads that could be easily ambushed by the enemy. By contrast, Estigarribia stressed mobility with flanking and envelopment tactics and repeatedly surrounded the Bolivian units. He concentrated on capturing all the water sources in the Chaco, a strategy that inflicted much hardship on the Bolivians. The Bolivians troops, accustomed to higher altitudes, also had great difficulty acclimatizing to the low, swampy terrain of the Chaco. Many of the Bolivian soldiers could not understand why they were fighting for such a strange and worthless territory. Paraguayans, by contrast, saw the war as a struggle for national survival and had higher morale. However, troops on both sides suffered from disease, starvation, and water shortages.

By late 1934 the Paraguayans controlled all the Chaco, and their armies were ready to advance into Bolivia itself. By this time, the Bolivians had begun to rally. General Kundt had been removed from command in December 1933, and President Salamanca was forced from office by the army in late November 1934. The Bolivians began to win some victories by April 1935, in part due to the fact that the Paraguayans were by this stage overextended and tired. However, the Bolivians realized that they were unlikely to regain the Chaco, either diplomatically or militarily. At the same time, Paraguay was running out of food, supplies, and ammunition and was on the verge of bankruptcy. As such, the two countries signed a cease-fire on June 12, 1935, with the war having lasted almost exactly three years.

It took until July 21, 1938, to sign the final peace treaty, which left most of the Gran Chaco in Paraguayan territory. Although the League of Nations and neighboring states in South America had made diplomatic efforts to settle the war while it was in progress, neither side had a motive to end the war until mutual exhaustion set in.

The Chaco War cost an estimated 100,000 lives, about 60 percent of them Bolivian. Bolivia had mobilized 250,000 troops during the war, while Paraguay had mobilized 140,000. Both states emerged from the war exhausted and debt ridden. Postwar recrimination in Bolivia led to much criticism of the governing elite, culminating in a revolution in 1952 that brought in modest democratic reforms.

Second Sino-Japanese War (1937–1945)

The Second Sino-Japanese War began over a minor altercation in North China on July 7, 1937, and continued until Japan's surrender on August 14, 1945. The Marco Polo Bridge incident differed from previous altercations between Nationalist China and imperial Japan because of Jiang Jieshi's (Chiang Kai-shek, 1887–1975) commitment to resisting Japanese military aggression. From North China, the conflict expanded to a full-fledged war between Chinese Nationalist and Communist forces against the Japanese army and navy and puppet governments. The conclusion of the war witnessed a weakened Nationalist China susceptible to a takeover by the Chinese Communist Party (CCP) and the collapse of the Japanese empire.

Japanese militarists gained their first foothold on Chinese territory in 1931 when the Kwantung Army occupied Manchuria and es-

tablished the puppet state of Manchukuo. Not satisfied, the Japanese army continued to press China and succeeded in carving out two autonomous regions in North China under Japanese protection. During this period, Jiang's Nationalist government pursued a strategy of appeasement toward Japan's militarists while conducting bandit-extermination campaigns against the CCP. Jiang fervently believed that the communists presented a greater threat to China. He declared that the Japanese were a disease of the skin but that the communists were a disease of the heart.

The first phase of the war began at the Marco Polo Bridge and ended with the fall of Wuhan in October 1938. By July 1937 Jiang shifted to an uneasy alliance with the CCP and pursued a policy of resistance to Japanese aggression. In this context, he rushed Nationalist forces to North China and ordered local commanders to resist, escalating the conflict and forcing the Japanese army to reinforce its units. In September, Jiang expanded the scope of the conflict when he committed his best German-trained divisions to fighting the Japanese in Shanghai, with its international concessions. Thus, Jiang demonstrated his commitment to resisting Japan anywhere in China and sought international recognition and support for his efforts. Nationalist forces stubbornly resisted the Japanese army and navy forces for three months until the Nationalists were dislodged and forced to flee inland.

The Japanese army launched offensives from North China and along the Yangzi River that were designed to bring the Nationalist army to battle and destroy it, thereby forcing Jiang's government to negotiate. From Shanghai, the Japanese army took the capital of the Nationalist government at Nanjing in December. For six weeks the Japanese army began a program of systematic atrocities known as the Rape of Nanjing. This event steeled Chinese resolve and tarnished the reputation of the Japanese army. The Chinese strategy was to trade space for time. Subsequent Japanese advances met dogged Chinese resistance and extreme measures to slow the Japanese army, including intentionally breaking the Yellow River's dikes, which caused massive flooding and loss of life.

The second phase of the war, October 1938 to December 1941, was marked by a strategic

stalemate. Lacking sufficient manpower to conquer China, the Japanese shifted their strategy from large-scale military offensives to the securing of a political settlement. The Japanese controlled a weblike network of cities and communications lines in northern and central China but not in the countryside. To secure their hold, they created puppet regimes to help maintain security and win popular support. The Nationalist government, based at Chongqing, maintained a low-intensity warfare designed to wear down and hopefully wear out Japanese forces while working to build up the economy and the industrial capacity of Free China, the latter consisting of those areas outside Japanese control. During their retreat inland, the Nationalists dismantled and relocated whole factories to build a new economic base and to retrain and reequip the army in order to continue the war. The communists, based in the North China countryside outside effective Japanese control, organized effective popular resistance and harassed Japanese lines of communication. Japanese reprisals, known as the Three All campaign—burn all, kill all, destroy all—further alien-

ated Chinese support, which swung in favor of the communists.

With the Japanese attack on Pearl Harbor on December 7, 1941, the Second Sino-Japanese War folded into the broader World War II. China received increased British and American support in the form of loans, military advisers, and lend-lease aid. At first this aid came via the Burma Road until it was closed by the Japanese invasion of Burma in 1942. Afterward, aid arrived by air transport from India. As the war expanded, Japan was compelled to withdraw units from China in order to meet commitments elsewhere. In this final phase, the Japanese army managed limited objective offensives, such as Operation Ichigo in May 1944, aimed at destroying American air bases that launched bombing raids against Japan. Still, Nationalist China's fighting effectiveness declined, and Jiang did not undertake significant major offensives in Burma and Central China until the waning months of the war. Jiang seemed more concerned with equipping, training, and husbanding his best units for the coming conflict with the CCP, which was also preparing for the coming civil war. The war ended with Japan's surrender

on August 14, 1945, and the formal surrender of Japanese troops to China on September 9, 1945.

The toll of the Second Sino-Japanese War has been estimated at 2.5 million military deaths on both sides, with a very rough estimate of Chinese civilian deaths at 10 million due to fighting, starvation, and flooding. For Jiang's Nationalist government, rampant inflation, corruption, and war weariness rendered him vulnerable to the communists in the ensuing civil war. By 1949 the Nationalists had fled to Taiwan, and Mao Zedong's CCP ruled China. For Japan, the war in China led into a larger unwinnable war with the United States and Great Britain that ended in the collapse of the Japanese empire.

The Russo-Japanese War (1904–1905)

The Russo-Japanese war of 1904–1905 resulted from disputes between Russia and Japan over the future of the Chinese region of Manchuria and the kingdom of Korea. Russia and Japan had been competing for power and influence in the northwestern Pacific region for many years prior to the outbreak of war in 1904. The war resulted in a spectacular series of victories for the Japanese armed forces over the Russians, and the victory of an Asian power over a European power inspired anticolonial movements in Asia and Africa.

The decline of the Chinese Empire in the late nineteenth century saw a gradual loss of Chinese control over outlying regions such as resource-rich Manchuria. At the same time, Russia had expanded across Siberia in the late nineteenth century; this expansion was supported by the single-tracked Trans-Siberian railway. Russian leaders in this period hoped that Manchuria would fall into their sphere of influence.

At the same time that China was in decline, Japanese leaders embarked upon a major program of crash industrialization, convinced that industrialization followed by a rapid military buildup offered the only path for Japan to survive the threat posed by Western imperialism. By the 1890s the Japanese harbored ambitions for expansion into the Chinese Empire. In the 1894–1895 Sino-Japanese War, the Japanese quickly defeated the Chinese and seized the Liaotung Peninsula. However, the major European powers, led by Russia, Germany, and France, intervened diplomatically and forced the victorious Japanese to return the peninsula to China.

Capitalizing on the 1895 Chinese defeat, Russia forced the Chinese government to grant it a lease over the Liaotung Peninsula in 1898. The Russians began work on a major fortress and naval base known as Port Arthur and located on the peninsula. Russia also obtained permission from China to build a railway across northern Manchuria, thus forming a shortcut by connecting the Trans-Siberian line to Vladivostok. A branch line was then built from Harbin in Manchuria southwestward to Mukden and Port Arthur. The Japanese leaders became alarmed and angered at the Russian gains in Manchuria, especially when the Russians hinted that they had ambitions in Korea, which the Japanese regarded with deep concern due to Korea's proximity to Japan.

After prolonged tensions between the two countries, war broke out on February 8, 1904, when the Japanese launched a surprise naval attack on Port Arthur. Japanese troops landed in Korea the next month, overran the country, crossed the Yalu River, and moved swiftly into Manchuria. Japanese forces also landed on the Liaotung Peninsula and cut off the Russian garrison at Port Arthur on May 26, beginning a protracted siege. The siege of Port Arthur prefigured many aspects of World War I with the use of trenches, barbed wire, machine guns, and costly frontal infantry attacks. Port Arthur eventually fell on January 2, 1905, although the Japanese suffered heavy losses. With the siege of Port Arthur in progress, Japanese armies overran Russian positions in Manchuria and moved north toward Mukden.

The decisive land battle of the war took place at Mukden from February 20 to March 10,

1905, where a Russian army of 300,000 confronted a smaller Japanese army along a front more than 70 miles (110 kilometers) long. However, the Japanese made superior use of their mobility and outflanked the Russians, forcing them to retreat. The Battle of Mukden was one of the largest battles in history up to that point. Throughout the war, the Russians were poorly led and had difficulty in supplying their armies along the lengthy Trans-Siberian railway, which suffered frequent bottlenecks.

The decisive sea battle of the war took place in the Tsushima Straits during May 27–28, 1905. The Russian Baltic fleet had sailed the entire distance around the world from the Baltic Sea only to be annihilated by the Japanese.

By the spring of 1905 the Japanese economy was approaching bankruptcy, while the Russian home front, having experienced food shortages, defeats, and hardships, teetered on the brink of rebellion. American mediation was essential to ending the war, which took place with the

signing of the Treaty of Portsmouth on September 5, 1905.

Under the terms of the Treaty of Portsmouth, Russia recognized Japanese dominance in Korea and turned its lease of the Liaotung Peninsula and Port Arthur over to Japan. Both sides evacuated Manchuria and agreed to return it to Chinese sovereignty. Japan gained the southern half of Sakhalin Island from Russia. Overall, the treaty marked the emergence of Japan as a major regional power in the northern Pacific.

In Japan, the Russo-Japanese War glorified militarism and strident nationalism, although there was also much dissatisfaction among nationalist circles over the lack of greater territorial gains for Japan. Furious nationalist protests forced the resignation of the Japanese cabinet. In Russia, the war resulted in industrial strikes, peasant revolts in the countryside, and middle-class demands for reform. Although Tsar Nicholas II crushed the worker and peasant revolts, he did create a parliament, the Duma, that was granted limited powers. In terms of foreign policy ambitions, the Russians turned their attention back to the Balkan region of Europe.

The Russo-Japanese War was also important for the lessons, many of them wrong, that it seemed to teach. Many observers concluded, mistakenly, that the Japanese had won the war because of their superior morale and samurai spirit. The war seemed to show that daring attacks and offensive action could overcome new technology, such as machine guns. The fact that the war was so short in duration also reinforced the illusion of the short war, or the belief that the next war among major powers would be over quickly. In addition, the economic exhaustion of Russia and Japan apparently showed that no major power could fight a modern war for any

➤ BATTLE OF TSUSHIMA STRAITS

The Battle of Tsushima Straits was the final decisive battle of the Russo-Japanese War. The entire Russian Baltic battleship fleet under Admiral Zivony Rozhdestvensky had sailed thousands of miles to reach Japan from Europe. This was due to the earlier near destruction of Russian naval power in the Pacific at the hands of the Japanese Navy. The Russian Baltic and main Japanese fleets clashed on May 27 and 28 in the Tsushima Straits adjacent to the Japanese mainland between Japan and Korea. The older Russian ships were no match for the newer and more superior Japanese models, and superior Japanese gunnery tactics destroyed two-thirds of the entire Russian Baltic fleet. This major defeat forced the Russians to sue for peace. The loss of prestige of Russia at the hands of what Europeans deemed an inferior race also did much to raise the status of the Japanese in the eyes of the European Great Powers of the early twentieth century.

—Abraham O. Mendoza

length of time. As coming events would prove, both the illusion of short wars and the belief that morale could overcome technology were wrong.

■ Introduction: The First World War

World War I (1914–1918) has often been described as “the war to end all wars.” Instead, it was the harbinger of a completely new type of warfare in which technological advances enabled belligerents to kill

or injure vast numbers of soldiers and civilians and to destroy cities with greater efficiency. By the end of the war in November 1918, tens of millions of people were dead for no clear purpose. Rather than ending all future warfare, the

dissatisfaction that grew out of peace treaty negotiations led in great part to the outbreak of World War II in 1939.

The causes of World War I are nebulous. At the time, European foreign policy was a tangle of alliances, imperialist rivalries, nationalist chauvinism, and xenophobia mixed with memories of old slights and humiliations between nations. The last general war in Europe had taken place 99 years earlier with the defeat of Napoleon. From time to time international crises had arisen, causing nations to expect war at any moment, but these events had been resolved at least temporarily by diplomatic means.

The German empire, only in existence since 1871, was ruled by the autocratic Wilhelm II (1859–1941), who was determined that Germany would be respected and feared by the other Great Powers. This determination led to a naval buildup prior to World War I supported by successive acts of legislation, intended to create a fleet of ships that would rival Great Britain's. The result of this naval escalation was the formation of the German High Seas Fleet, followed by Great Britain's adoption of HMS *Dreadnought*, the first of a new and more powerful type of battleship. The British were alarmed at Germany's intentions and the balance of power in Europe. The Germans were suspicious that the Triple Entente of Britain, France, and Russia intended to encircle their nation and limit Germany's role as a European and colonial power. The military buildup that stemmed from their mutual suspicions, as well as those of the other European nations, did much to increase the likelihood that some international incident or other would lead to open warfare.

The event that served as the catalyst to the war was the June 28, 1914, assassination of the heir to the Austro-Hungarian throne, Archduke Franz Ferdinand, and his wife, Sophie, Duchess of Hohenberg, who were making an official visit to Sarajevo, the capital of Bosnia. The assassin, Gavrilo Princip, was a young Serbian nationalist affiliated with the secret society the Black Hand, a nationalist group that worked toward the goal of uniting Serbia and Bosnia-Herzegovina. Austrian officials argued that Serbia must be held accountable for the assassination, and at any rate, Austrian leaders were willing to take advantage

of the opportunity to suppress Serbia's nationalist groups with force.

On July 28, 1914, Austria declared war on Serbia, reassured of the support of their German allies. Over the next few days European diplomacy broke down, the major powers mobilized their armies, and the continent was divided into armed camps. Russia sided with Serbia, and France and Great Britain sided with their ally, Russia. Germany declared war on Russia on August 1 and France on August 3. On the following morning, Germany also declared war on Belgium in order to send troops through Belgian territory on their way to France. Great Britain, which, with Prussia, France, Russia, and Austria, had guaranteed Belgium's neutrality in 1839, had pledged to support Belgium if it was invaded by Germany and resisted. Germany's invasion and Belgium's resistance brought the British into the war on August 4. Thus, Germany and Austria-Hungary, supported by Turkey, became the major Central Powers; the major Allied Powers were Great Britain, France, and Russia from 1914 until the Bolshevik Revolution ended Russia's participation in late 1917, by which time the United States had abandoned its neutral stance and had entered the war on the Allied side.

At the time the war began, there was a rush for civilians to join up and go to war before it ended; popular opinion in the belligerent nations supported the idea that the war would last for only a few months. Instead, the Great War, as it was known as the time, dragged on for more than four years, and more than 65,000,000 troops were mobilized. Governments discovered that they must carefully control enlistments in order to avoid draining crucial industries of their workers, and many jobs were opened to women for the first time so that male workers who had enlisted could be replaced, at least temporarily. The years of warfare resulted in over 37.5 million casualties, many from the new technological innovations in poison gasses, machine guns, high-explosive shells, tanks, airplanes, and artillery. These new technologies completely changed the nature of warfare to one in which large numbers of people could be injured or killed at great distances.

The Great War finally ended on November 11, 1918, when the Allies forced Germany to

agree to an armistice. In January 1919 peace negotiations began in Paris, led by the “Big Four”: Woodrow Wilson, president of the United States; David Lloyd George, prime minister of Great Britain; Vittorio Orlando, premier of Italy; and Georges Clemenceau, premier of France. Wilson insisted upon shaping the peace treaties according to the “Fourteen Points” he had produced the year before, an idealistic plan for “Peace Without Victory.” This plan, to include freedom of the seas, open covenants between nations, self-determination for the subject peoples of the now-defunct Central Powers, and a reduction of armaments, was at odds with the postwar aims of the other Allied Powers, who were more concerned with containing Germany than with noble causes. Wilson’s 14th point, a “general association of nations,” led to the creation of the League of Nations.

In the long run, the resulting Versailles Treaty with Germany was almost entirely self-defeating. While it was only one of the five peace treaties negotiated between the Allies and the former Central Powers, it was arguably the most important. The harsh terms dictated to Germany in the Versailles Treaty were a major factor in the subsequent rise of Adolf Hitler and the outbreak of World War II.

The Outbreak of World War I

World War I (1914–1918) erupted during a series of events known as the July Crisis, a period of frenetic communications and maneuvering that occurred during the weeks after the June 28, 1914, political assassination of Archduke Franz Ferdinand, heir to the Austro-Hungarian throne, and his wife, Sophie, the duchess of Hohenberg.

The couple had been making an official visit to Sarajevo, Bosnia, part of the empire, where Ferdinand was to observe military exercises. While in Sarajevo, the archduke and his wife were murdered by Serbian nationalists, members of the secret revolutionary organization Ujedinjenje ili Smrt (Unification or Die), but generally known as the Black Hand, which was part of a Pan-Slavic movement working for the creation of a Greater Serbia and had ties to the Serbian government.

There were two major alliance systems in Europe in existence at the time. These were the Triple Alliance, which included Germany, Austria-Hungary, and Italy, and the Triple Entente, which included Great Britain, France, and Russia. Both alliances had begun in a series of defensive treaties or the resolution of territorial conflicts between the nations in the late nineteenth century. Through the years, however, both systems had come to incorporate promises or expectations of military involvement to protect the security of the major powers involved. The Triple Alliance and Triple Entente were never completely rigid systems, and there were many times in which cooperation took place between members of opposing groups; however, in the summer of 1914, these entangling alliances obstructed and then made impossible any diplomatic solution to the disintegrating stability of Europe.

The Austrian government decided that Ferdinand’s assassination would provide an opportunity to stop Serbian expansionist ambitions in the Balkans as well as the activities of Slav separatists. Vienna responded to the tragic murder of the archduke by sending a harsh ultimatum to Serbia on July 25 demanding that all anti-Austrian propaganda be forbidden immediately, that Austrian officials be involved in quelling nationalist activities in Serbia, and that Austro-Hungarian representatives be allowed to participate in Serbia’s prosecution of the murderers. In the meantime, the German government had issued the infamous Blank Cheque to their Austrian allies, promising their support in whatever the Austro-Hungarians had to do in order to suppress troublesome Serbia.

Within only hours after receiving the list of demands from Vienna, the Serbians responded with their agreement to all points in the ultimatum except the demand that they accept the

► THE SCHLIEFFEN PLAN

The Schlieffen Plan was the German General Staff's overall strategic plan for knocking France out of a war quickly on the western front before Russian mobilization on the eastern front. Formulated by General Alfred Graf von Schlieffen in 1905, the General Staff plan expected to take advantage of tsarist Russia's slowness in mobilizing fully for war, which was expected to take several weeks. In contrast, France was expected to be ready to confront German forces within a matter of days on the western frontier. A skeletal German force would meet the bulk of the French forces in the frontier east of Paris, while a powerful and much larger German force would push through the Netherlands and Belgium to attack the rear of the French forces. In 1906 modifications were made to the plan by General Helmuth von Moltke to add more divisions to the skeletal attack force and avoid violating the neutrality of the Netherlands, thereby weakening the original plan. As a result, with the outbreak of World War I, a French counterattack against German forces, rapid Russian offensives, fierce Belgian resistance, and the entry of the British Expeditionary Forces stalled the scheduled timetable of the Schlieffen Plan. The end result was years of trench warfare along the western front, with bloody battles of attrition amid machine-gun fire, over-the-top attacks, and artillery barrages.

—*Abraham O. Mendoza*

participation of officials from Austria in prosecuting those involved in the assassination plot. This, they argued, would violate the terms of Serbia's constitution. Rejecting what was deemed a partial compliance from the government in Belgrade, the Serbian capital, the Austrian emperor Franz Joseph signed orders for the mobilization of his army for an invasion of the Balkan nation.

From that point, the European nations lurched toward armed conflict. On July 28, 1914, Austria declared war on Serbia. Russia, with its own Slavic population, was Serbia's traditional protector as well as Austria's rival. By the next day, the Austrians received word that Russia had begun to mobilize. Germany sent a warning to Russia on July 31 demanding that the Russians stop their mobilization. When they did not com-

ply, Germany declared war on Russia on August 1 and on France, Russia's ally in the Triple Entente, two days later. On August 5, Austria-Hungary declared war on Russia. Five days later, France declared war on Austria-Hungary.

The Germans had prepared for the possibility of war with the Schlieffen Plan, named for Alfred von Schlieffen and Helmuth von Moltke, the two successive German chiefs of staff who had formulated the strategy earlier in the century. The plan called for the German Army to attack and defeat France quickly, marching through Belgium to do so, and then to concentrate its military forces against Russia, which would require more time for its mobilization. With this strategy, the Germans would be able to avoid fighting a war on two fronts.

The French also had a war strategy, Plan 17, that had been adopted in 1913. Plan 17 was largely designed for an invasion of Germany and was focused especially on allowing for France's recovery of Alsace and Lorraine, the two provinces lost to Germany at the end of the Franco-Prussian War of 1870–1871. The strategy would deploy much of France's army too far to the south to be of much use against the Schlieffen Plan.

Belgium was a neutral nation, its perpetual neutrality guaranteed by the Treaty of London, which had been signed by England, France, Prussia, Russia, and Austria in 1839. This neutrality would be violated if German troops invaded Belgium on their way to France according to the terms of the Schlieffen Plan. In preparation, Belgium began to mobilize its army on July 29 and then on August 3 rejected demands from Berlin that German troops be granted free passage through Belgian land.

Great Britain was waiting and watching the play of events with great apprehension. The British government had offered to negotiate an end to the growing hostilities in Europe during July 1914, but these overtures came to nothing. For many years, British plans had been focused on the possibility of contributing naval and monetary support in case of war between Britain's allies and Germany, but in the end this was not the case. The British Army was mobilized partially on July 29, and a general mobilization followed on July 31 so that Britain was prepared in

case diplomatic efforts failed. After much deliberation and fully aware that they could not stand by and watch Germany take control of continental Europe, the British cabinet decided to act under the following circumstances: If Germany invaded Belgium and the Belgians resisted, Britain would enter the war as one of the 1839 guarantors of Belgian neutrality. If Germany invaded Belgium and the Belgians allowed them to pass unchallenged, Britain would be under no obligation to protect Belgian neutrality.

As it happened, German troops entered Belgium on the morning of August 4, 1914. The Belgians launched a furious resistance and appealed to the British for help. Great Britain dispatched an ultimatum to Berlin demanding that German troops withdraw from Belgium by midnight (11:00 p.m. in London). When this deadline expired without the withdrawal of German troops, Great Britain declared war on Germany. The Great War had begun.

Leadership of the Great Powers in 1914

In 1914 the major belligerent powers of World War I operated under a variety of political systems and leadership. Of the Allied Powers, Great Britain was a constitutional monarchy with a strong parliament, Russia was an autocracy with a legislature but a system in which the tsar was left to limit his own powers, and France was a republic led by a conservative president and a socialist prime minister. The major members of the Central Powers, both Germany and Austria-

Hungary, were parliamentary monarchies, although in each case conservative hereditary rulers played politicians and bureaucrats against each other in order to maintain power. The various heads of state, personifications of their countries' traditions and aims, grappled with their changing roles in the early twentieth century even as they struggled to prepare their nations for modern warfare.

Great Britain's king was George V (1865–1936; r. 1910–1936), a taciturn and conservative former naval officer, who was, in common with the German kaiser, a grandson of the late Queen Victoria (1819–1901; r. 1837–1901). George was a constitutional monarch who reigned but did not rule over a vast empire that included India, Australia, Canada, and other dominions and colonies throughout the world. The British Parliament, under the guidance of the Liberal prime minister Herbert H. Asquith, was in charge of the government and the administration of the war effort, and the role of George V was one primarily based on ceremonial duties and tradition.

During the war, the British royal family came under increased criticism and even some suspicion because of their German ancestry and family ties. It was this controversy that led George V to change the family's name from Saxe-Coburg-Gotha to Windsor in 1917. Another controversy and one that has outlived him is his failure to rescue his cousin, Tsar Nicholas II of Russia, and his family before they were assassinated by the Bolsheviks in 1918. Although the British government explored plans for the rescue of the Romanovs, British public opinion was largely unfavorable toward the despotic Russian monarchy. Concern over the political problems that would likely result in his nation if asylum were granted to the unpopular Romanovs led the British monarch to scrap the idea of a rescue.

Nicholas II (1868–1918; r. 1894–1917), known as “Autocrat of All the Russias,” had been forced by the Russian Revolution of 1905 to convene a Duma, or legislative assembly. Despite the growing discontent among the population and demands for civil liberties for Russians and more power for the Duma, Nicholas was determined to limit the role of the assembly. With the cooperation of the Russian State Council, made up of

the tsar's appointees, he managed to subvert reforms repeatedly. In August 1914 the Fourth Duma voted to dissolve itself for the duration of the war, but the disastrous effects of Nicholas's inept military command and the ruinous influence of the peasant mystic and faith healer Gregor Rasputin (1869–1916) over the imperial family led to the public demand for the Duma's recall in 1915. Eventually, several members of this Duma participated in the short-lived Provisional Government set up during the Russian Revolution of 1917.

In 1914, the president of France's Third Republic was Raymond Poincaré (1860–1934), a Conservative and former prime minister. Poincaré took the lead in government matters, wielding the upper hand politically in an era in which France's prime minister—at the time, the Independent Socialist René Viviani (1863–1925)—generally controlled the government. Poincaré was also deeply anti-German, and his commitment to France's alliance with Russia played a central part in the July Crisis of 1914, which prompted the onset of the war. Although Poincaré remained president until 1920, he was eclipsed in managing France's affairs after Georges Clemenceau became prime minister in 1917.

Kaiser Wilhelm II (1859–1941; r. 1888–1918) was the German emperor in 1914. The eldest grandchild of England's Queen Victoria, Wilhelm had a difficult relationship with his relatives in the British royal family and spent much of his reign trying to build up a naval fleet to match or surpass the British Royal Navy. His fascination with all military and technological matters and his consciousness of his exalted station in life convinced him that he was a better arbiter of German foreign policy than his more seasoned or experienced ministers. Wilhelm also failed to understand that personal diplomacy among fellow monarchs was no longer a suitable way to settle national disputes when kings did not exercise absolute power. He frequently made promises of support that were contradictory, such as courting friendly relations with Russia and Austria-Hungary at the same time before 1914 while these countries were hostile toward each other. Ultimately, his assurance to the Austro-Hungarian emperor Franz Joseph (1830–1916; r. 1848–1916) that Germany would support whatever efforts were necessary

to quell Serbian nationalism amounted to a blank check of support for Austria-Hungary and further fueled the onset of World War I.

Franz Joseph became the emperor of Austria and king of Bohemia at the age of 18 in 1848 and was crowned king of Hungary in 1867, remaining on the throne for 68 years. In 1849 he had turned back Austrian constitutional government in favor of a renewal of absolutism; under his leadership, Austria experienced conflicts with France, Hungary, and Sardinia; had sided with Prussia against Denmark successfully in 1864; and then fought Prussia unsuccessfully in 1866. In 1867 Hungary's population was granted equal footing with Austria in the *Ausgleich*, which created the Dual Monarchy, and Franz Joseph was crowned king of Hungary. By 1914, however, Franz Joseph was elderly and disillusioned, having seen his brother, Maximilian, emperor of Mexico (1832–1867; r. 1864–1867), executed by a firing squad of Mexican republicans; his only son die tragically and mysteriously in 1889; and his empress, Elisabeth of Bavaria (1837–1898), assassinated by an Italian anarchist. In addition, Austria had ongoing difficulties with Slavic separatists in her Balkan territories, and these were encouraged by Serbia. When his great-nephew and heir, Franz Ferdinand (1863–1914), was assassinated at Sarajevo in June 1914, Franz Joseph was easily convinced by his ministers that Serbia must be dealt with firmly. The ultimatum sent to Serbia and the series of events that took place between Austria-Hungary and Serbia and their respective allies during the July Crisis of 1914 led to the outbreak of World War I.

Men, Munitions, and Supply

Although warfare had always required strength in troop numbers, the belligerent nations were caught off guard by the changed technology of warfare almost immediately upon the outbreak of hostilities in 1914. Even war departments that had planned for the likelihood of a major war found themselves undersupplied, and munitions shortages reached crisis proportions very quickly. World War I represented a break with former warfare and ushered in an era of battles that lasted for months, consumed unprecedented levels of munitions, and created casualties in vast numbers and with a horrific expense of lives.

Manpower was a greater problem for Great Britain than Germany, France, or Russia since, unlike the other belligerents, the British had avoided adopting conscription and still relied on a small professional army. In August 1914 the British Army and Britain's Territorial Force and Reserves totaled 733,514 men. The British could mobilize six artillery divisions and one cavalry division but were unprepared for war on the European continent and had assumed for years that their contribution to a continental war would be naval and monetary. In August 1914 the British Expeditionary Force sent to France comprised six of Britain's seven divisions. By the end of 1918 Great Britain had sent 5.7 million soldiers into a war on foreign soil, calling into service a vast proportion of its civilians and, to supply them, every manufacturing concern at its disposal.

France had a standing army of nearly 800,000 men but with conscription could mobilize more than 4 million troops. The French were also depending on Plan 17, their strategic offensive plan for a war with Germany that was intended to split the German Army and recapture Alsace and Lorraine, lost to the Germans after the Franco-Prussian War of 1870–1871. The French, with jingoistic pride in their national spirit, or *élan*, neglected to consider the importance of modern artillery and possessed too few machine guns for modern warfare. In its execution, Plan 17 was no match for Germany's Schlieffen Plan. By 1918 the French had deployed more than 8.4 million troops.

In 1914 Russia's Duma (parliament) had approved plans to increase the size of the army by

➤ GERMAN SUPREME ARMY COMMAND (OHL)

The German Supreme Army Command (Oberste Heeresleitung, OHL) served as the highest level of command of German forces during World War I. While formally under the control of Kaiser Wilhelm II, the top generals of the OHL made most of the major decisions autonomously in collaboration with major German industrial concerns that profited from the war. Throughout the war the OHL acquired much power, often superseding the decisions of the elected government. In 1916 the OHL came under the control of Erich Ludendorff and Paul von Hindenburg, who created a nominal military dictatorship over Germany, thereby rendering both the kaiser and the Reichstag impotent. The OHL further mobilized the German economy for total war, exacerbating food shortages that had already resulted from the British blockade. As the public clamored for peace, the OHL pressed for victory. By late 1918 when the OHL began to see Germany's position on the western front as dire, they allowed for the creation of a civilian government to compromise an armistice with the Allies. As a result, they were also able to cast the blame for the defeat on the so-called November criminals. The reality was that they did not want to be responsible for the coming German defeat.

—Abraham O. Mendoza

nearly 40 percent, although this expansion program was not intended to be complete until 1917. Russia had a vast population and theoretically could field 37 corps readily upon the outbreak of hostilities. However, even a huge additional pool of men of military age, which could yield a mobilization of more than 5 million troops, could not win a war without adequate training or equipment, and Russia could not supply those. Transportation was another barrier to Russian success. Roads and railroads were unreliable and poorly maintained at best, so mobilization of millions of men was nearly impossible. Over the duration of Russia's participation in the war, 12 million Russians were mobilized, although logistics and supply remained catastrophically inadequate.

By 1915 shell shortages among the Allied Powers reached catastrophic levels. Great Britain,

France, and Russia found it more feasible to coordinate their purchases abroad than to bid against each other, particularly from sources in the neutral United States. Ultimately, the British assumed responsibility for placing Russian orders, as well as their own, in the United States through the J. P. Morgan banking house, and the French began to place their orders for American-made munitions through the same source.

The Germans were arguably the best prepared for war of any of the belligerent nations in 1914. With nearly 900,000 well-trained and well-equipped men in the peacetime army and more than 3 million reservists who could be mobilized at short notice as well as an up-to-date navy second in size only to that of Great Britain, Germany's position appeared to be unassailable. By the end of the war, Germany had sent to war 11 million troops. Ironically, however, the Germans had gone to war in 1914 having equipped their military with all the munitions, machine guns, and artillery necessary for a short war, not one lasting more than four years.

The Germans had adopted the Schlieffen Plan earlier in the century as their strategy for avoiding a war on two fronts against France and Russia. Named after Alfred von Schlieffen and Helmuth von Moltke, the successive German Army chiefs of staff who created the strategy, the plan called for Germany to invade France through Belgium and quell the French Army before turning to face the Russian Army, which was expected to take at least six weeks to mobilize.

Austria-Hungary had 3 million men in their standing army and reserves in 1914, and by late 1918 the Habsburg empire had mobilized 3.8 million troops. The multiethnic force combined soldiers drawn from all the subject populations of the empire, however, as well as from Austria and Hungary, so the army of Emperor Franz Joseph was made up of men who practiced five religions and nine different native languages. Prewar modernization of this army was limited by the conservative military hierarchy of imperial Austria, and thus the Dual Empire entered the war unprepared to fight a twentieth-century conflict. Austria-Hungary's inconsistent record of military successes on the eastern front increasingly came to depend upon Germany's

leadership, and as a result the weaknesses of the empire became more apparent internationally. Franz Joseph died in 1916 after 68 years on the Austrian throne. Throughout 1917 and 1918 the Austro-Hungarians faced internal mutinies and industrial unrest, and the empire splintered from within as the Poles, Czechs, Slavs, and Hungarians declared their independence. By the end of World War I, no empire would remain.

Overall, approximately 65 million combatants were mobilized during 1914–1918. Of these, there were more than 37.5 million casualties, including those killed, wounded, taken prisoner, or missing. Estimates of the financial costs of the war in contemporary figures range as high as \$82 million. None of these figures is likely to be entirely reliable, however, since the human and material costs were so vast as to defy accounting.

American Neutrality

On April 2, 1917, President Woodrow Wilson addressed a special session of Congress and asked for a declaration of war against Germany. Congress complied within days. Wilson's appeal was not made lightly; the war in Europe had begun more than two and a half years earlier, and throughout that time the president had done everything possible to keep the United States out of the war. Ultimately, however, American neutrality proved impossible to maintain in the face of Germany's unrestricted submarine warfare, increasing U.S. investment in the Allied war effort, and American public opinion.

Earlier, on August 19, 1914, only two weeks after the start of war in Europe, President Wilson had addressed the U.S. Senate, warning that Americans must remain impartial and apart from the conflicts of European nations. He insisted that the United States “must be neutral in fact as well as in name during these days that are to try men’s souls.” According to Wilson’s point of view, the United States had a more exalted role to play in the world than those nations engaging in mutual bloodshed, one that depended on absolute impartiality. The United States should act as the arbitrator between nations, using its efforts to create a better world. Wilson, a highly principled man, had an idealistic bent that often obscured the realities of international affairs. He repeatedly offered to mediate between the belligerents, apparently refusing to consider the magnitude of the grievances between them and naively urging compromise as the most desirable outcome of the hostilities.

Wilson also insisted that as citizens of a neutral nation Americans were entitled to travel as they liked and trade as they liked, refusing to acknowledge that this unfettered commerce would make it difficult for them to remain above the conflict in Europe. That Americans’ freedom to trade favored the Allies made little difference to Wilson’s interpretation of neutrality. The powerful British Royal Navy controlled the Atlantic, leaving the Central Powers without access to American-made goods. At the same time, the Allied Powers had recognized almost immediately after the onset of hostilities that they would be unable to equip their armies adequately, and they began to place orders for munitions and other military equipment with manufacturers across the United States. Thus, American companies were unable to trade equally with all belligerents, a situation that created outrage not only among Americans of German and Austro-Hungarian descent but also in the Central Powers, who argued that this one-sided commerce was anything but neutral. Subsequently, Germany deployed U-boats (*Unterseebooten*) to destroy Allied supply lines crossing the Atlantic. In early 1915 they launched a policy of unrestricted submarine warfare, declaring the waters around the British Isles to be a war zone and warning that all British shipping would be torpedoed, re-

➤ ANTI-GERMAN SENTIMENT DURING WORLD WAR I

Despite President Woodrow Wilson’s promise of neutrality and noninvolvement in World War I, by 1917 the United States entered on the side of the Allies. Many German Americans held mixed feelings regarding American involvement against their country of origin, and some were vehemently opposed to U.S. involvement. Upon American entry into the war, many German immigrants were treated with suspicion and seen as disloyal as American society become infused with anti-German sentiments. Some German Americans were tried for sedition, sometimes for being unwilling to support the war effort against Germany. Sauerkraut became “liberty cabbage” and hamburger became “liberty steak” in a frenzy of name changes of what were rapidly becoming common American products. While a majority of German Americans were loyal to their new country and many of them served in the military, they felt obligated to anglicize their names and shun their heritage in an effort to prove their loyalty. Isolated incidents of murder and violence, while not widespread, did illustrate the xenophobia unleashed by the American entry into the war.

—Abraham O. Mendoza

gardless of loss of life. They warned Americans not to travel on British ships.

The issue of American neutrality and German submarine warfare became a flash point several times, particularly after May 7, 1915, when the passenger liner *Lusitania* was torpedoed by a U-boat off the coast of Ireland and sank, resulting in the loss of 1,198 passengers and crew, including 128 of the 197 Americans on board. In the United States, Americans clamored for the government to punish the Germans and were outraged when three days later Wilson declared, “There is such a thing as a man being too proud to fight; there is such a thing as a nation being so right that it does not need to convince others by force that it is right.” The Germans temporarily discontinued their policy of unrestricted submarine warfare in the face of official protests lodged by the U.S. government, although in early 1917 they would resume this

practice. American public opinion was increasingly anti-German, partly a result of losses of American lives but also because of the success of Britain's very skillful campaign of propaganda in the United States, as the British endeavored to sway public opinion to their side.

By this time, however, the British were spending at least 40 percent of their total war-time expenditures in the United States, and American financial institutions were making large loans to grant credit for these purchases. In September 1915, 61 underwriters and more than 1,500 American banks subscribed to the Anglo-French Loan of \$500 million, and further loans followed. With hundreds of millions of dollars invested in the Allied war effort, the United States could not afford to stand by while the Central Powers won the war. Then, in early 1917, two events completed the demise of American neutrality.

The first of these was the notification, sent by the German ambassador in the United States, Count Johann von Bernstorff, to the American secretary of state, Robert Lansing, reporting that Germany would reinstate its policy of unrestricted submarine warfare on February 1. On February 3 the United States severed diplomatic relations with Germany. Later that month, the British turned over the Zimmerman Telegram to the American ambassador, and it was published in U.S. newspapers on March 1. Intercepted by British code breakers, the telegram was sent by Germany's foreign minister, Arthur Zimmermann, to the German minister in Mexico. It included Germany's promise to return "lost territory in Texas, New Mexico, and Arizona" to that country if Mexico would agree to an alliance. In light of this evidence that Germany was planning aggression against the United States, Wilson could no longer beg his countrymen for adherence to neutrality. The United States officially entered the war in April 1917, giving the Allies a fresh source of manpower and industrial resources as well as renewed morale.

World War I—In the Trenches

Trench warfare had appeared before World War I, most notably during the Napoleonic War, the American Civil War, and the Boer Wars, although nineteenth-century armies had usually engaged each other in wars of movement rather than warfare in which armies took up and defended stationary positions. The Great War that began in August 1914 quickly became a war of position rather than a conventional war of mobility. The first trenches on the western front were dug in September 1914 by the Germans shortly after the Battle of the Marne, when they were forced to retreat as far as the Aisne River. In order to hold their position against French and British forces, the German troops were ordered to dig in, and the French and British troops did so as well. Thus, the western front turned into a 400-mile (645-kilometer) series of entrenchments, eventually stretching from the North Sea coast of Belgium to the border of Switzerland. Trenches existed on the eastern front as well, but they were not as prevalent there, where troop positions were more widespread.

The trench system was a maze of connected channels carved out of the ground. The foremost was the frontline trench, which held intermittently placed reinforced dugouts to provide protection in each sector. The front line was connected by angled communications trenches to a command trench, another support trench to the rear, and behind that to a reserve trench. The entire system might be hundreds of yards or even several miles from front to rear. At various points there were camouflaged machine-gun positions or observation posts. There might also be saps, or short trenches extending forward from the frontline trench toward the enemy trenches. Long-range artillery was located some distance to the rear of the reserve trench. Trenches were

constructed in irregular zigzag formations to slow down enemy raiding parties, grenade blasts, and enfilading fire, which also meant that it was quite easy for defending troops to become lost and disoriented, especially in the dark of night or in inclement weather. Posted fingerboards gave the sectors the names of streets at home or, with bleak humor, pointed out the number of miles to Paris.

The trench was ideally 6 or 7 feet deep (about 2 meters) and about the same width. This was deep enough so that a man could stand with his head lower than the front parapet, which was made of packed earth and stacked sandbags, although the actual depth and width were generally dependent upon such factors as the rockiness of the local terrain and level of the water table. The trench floor was made of planks, or duckboards, intended to keep the soldiers' feet above water and mud but seldom doing so with any success. There was also a fire step about 2 feet high (60 centimeters), just high enough to enable a marksman to make use of loopholes left between the sandbags of the parapet. Interior trench walls were reinforced or revetted with timbers, discarded doors, or whatever was available nearby, and maintenance of the whole muddy fortification was an ongoing event. Between the trenches of the opposing troops, sometimes fewer than 100 yards in distance, was the area called no-man's-land. This space was an obstacle course of shell holes, mud, tangled barbed wire, and, quite often, dead or dying men.

During quieter periods the trenches were scenes of endless waiting and much boredom. The boredom gave way to terror during enemy bombardments, however, with bursting shrapnel shells raining pieces of scrap metal down on the trenches or, later, the blasting of guns firing high-explosive shells. Sniper fire was intermittent throughout the day and night, so it was crucial that those in the front line keep their heads below the parapets to avoid providing targets for the enemy.

Troops were sent into the front lines on a rotation system. British troops, for example, were to spend eight days in the front line, four in the reserve trenches, and then four supposedly resting at a location behind the lines, with occasional leave. The increasing scarcity of troops

German soldiers in a trench during World War I. (Library of Congress)

and equipment, however, often meant extended stays in the front line, along with the resident rats, frogs, and lice. Heavy bombardment generally delayed the removal of the dead, so the corpses of men shot by snipers or killed by shells might be dragged out of the way and stepped over by their living comrades for several days. Reports of knee-deep or even waist-deep water were routine. Men in the trenches were susceptible to two other dangers as well: trench foot and trench fever.

Trench foot was a condition in which a fungus attacked the feet of men who had stood in wet, clammy boots and socks for days at a time, and it was a serious problem for the troops, particularly during the first year of the war. Swollen feet turned red and then blue, grew numb from decreased circulation, and if left untreated could become gangrenous. Eventually soldiers began to coat their feet with whale oil and carry dry socks with them, and the problem lessened.

Trench fever, or pyrexia, was carried by the lice that infested the men in the trenches, leaving them miserable with itching red welts if they were lucky or shooting pains and high fevers if they were not. While this illness was not fatal, it was responsible for much sickness among the troops. It was nearly impossible to remain louse-free during time in a trench, since the nits remained in the seams of clothing even when washing was possible. Casual delousing, sometimes with the help of a candle flame or a match, was a constant activity.

Trench warfare was a factor, as well as a consequence, of the stalemate on the western front. While the trenches were the settings for vast

amounts of carnage and thus have come to be the identifying characteristic of the World War I battlefields in western Europe, these earthworks provided a level of shelter and safety where all other aboveground structures had been destroyed.

Major Battles of World War I

World War I (1914–1918) pitted massive conscripted armies of both the Entente (Britain, France, and Russia) and Central Powers (Germany, Austria-Hungary, and the Ottoman empire) alliance systems along various fronts in Europe, with smaller engagements in sub-Saharan Africa, Asia, and the Pacific. The western front, which ran along the length of Belgium and eastern France, bore the brunt of the German armies facing off against the British, French, and later U.S. forces throughout the war. The eastern front shifted between the borders of Germany, Austria-Hungary, and tsarist Russia to a more lengthy and scattered front inside Russia. The Italian Front was characterized by Italian engagements along its northern Alpine borders with the Habsburg empire. The Middle eastern front consisted of excursions by British dominion troops into Turkish territories in Gallipoli and Palestine, along with auxiliary Arab nationalist troops.

The British forces faced the German military along the northwestern sector of the western front along with their British dominion allies (Canadian, South African, and ANZAC forces). In the initial battles of 1914, the British relied on their crack military formations that formed into the British Expeditionary Force (BEF). In the

Battle of Mons (August 23, 1914), the BEF successfully engaged the numerically superior German forces before being forced to retreat back to the Marne River. As British and French positions were forced to retreat along various sectors of the western front after German forces were at the brink of reaching Paris, the First Battle of the Marne (September 6–10, 1914) signified a new Entente offensive to prevent further advances into central France. It also signified a greater willingness on the part of the Entente to prevent German advances toward the Atlantic from which they might later push into northern France. This “race to the sea” between BEF, French, and German forces led to increasingly large skirmishes, such as the First Battle of Ypres (October–November 1914) in which the BEF was crushed by German forces as it attempted to hold to the Belgian town for which this battle was named. As a result of these early battles the western front stabilized, in the sense that it shifted from a war of movement to one characterized by trench warfare along an increasingly stalemated front; accordingly, battle tactics and strategy changed on both sides. Future battles would consist of large conscript armies facing each other from trenches, separated by barbed wire in no-man’s-land, and facing machine gun and sniper fire, artillery barrages, and over-the-top raids.

The year 1915 was characterized by little movement in terms of the acquisition of territory along the western front and more so by the astonishing rate of casualties due to attrition warfare (numbering in the tens of thousands). In contrast, the year 1916 was characterized by large-scale battles with even larger numbers of casualties on both sides. The Battle of Verdun, fought in northeastern France, pitted several German and French armies from February 21 to December 18, 1916, and resulted in more than a quarter of a million deaths with at least 1 million wounded. French armies sought to prevent a major German push into northeastern France and engaged the bulk of their available troops to plug what was perceived as a vulnerable gap. Later that year, the Battle of the Somme (July–November 1916), which was a primarily British offensive in northern France, was halted by German forces. The Battle of the Somme would lead

to approximately 1.5 million casualties and would stand as one of the bloodiest battles of World War I. On July 1, 1916, alone, British forces would suffer an estimated 67,500 casualties, which included 19,200 deaths. As a result of this murderous episode, throughout 1917 the opposed armies showed restraint and were unwilling to commit high numbers of troops yet continued attrition tactics that continued to kill and maim in the tens of thousands.

On the eastern front, the Italian Front, and the Middle East, large-scale battles were also ubiquitous but were characterized by movement rather than stalemate. Along the eastern front,

where German and Habsburg forces faced tsarist troops along a wide front, after initial setbacks the Central Powers were able to push back the poorly equipped Russian armies into Russia. The Battles of Tannenberg and Battle of the Masurian Lakes of 1914 ensured that Russian armies retreated from eastern Prussia into Russian territory. German forces followed up on these victories through the Gorlice-Tarnow Offensive in 1915, advancing into Russian territory.

However, by 1916 Russian forces were able to advance against the Central Powers through the Brusilov Offensive, which was a major strategic setback for Austria-Hungary and forced

EASTERN FRONT, 1914–1918

Germany to draw divisions from the western front to buttress its ally (which significantly affected its position vis-à-vis Britain and France in that sector). In spite of this Russian breakthrough, German forces were able to sustain significant advances as the Russian Army collapsed, triggering domestic discord and eventually igniting the Russian Revolution of 1917 (and the resulting cession of vast tracts of Russia to Germany in the Treaty of Brest-Litovsk).

The Italians, entering the war as an ally of the Entente in 1915, fought mostly against Habsburg forces along its Austrian border in the Alps and along the Isonzo Valley. Italian efforts here would prove highly unsuccessful due to the inadequate tactics and training of Italian troops against the more highly trained and more effective Habsburg and German troops. In the Battle of Caporetto (October–November 1917), Habsburg and German troops would smash Italian offensives along the Isonzo Front.

The Middle Eastern campaigns, in which British forces (composed of mostly ANZACS and British Indian armies) and their Arab allies faced Ottoman forces, were characterized by major skirmishes in Palestine in attempts to capture Jerusalem and to secure the Suez Canal. The Gallipoli Campaign in the Bosphorus, which was meant to capture Constantinople, led to a large number of ANZAC and British casualties. As the British forces attempted to dislodge Turkish forces from high ground, Turkish snipers easily took down the advancing forces. The subsequent British retreat proved to be a more lasting success than this ill-advised offensive on the part of British command. British forces in Mesopotamia fought to dislodge Ottoman forces from Iraq, encountering significant resistance. British general Charles Townshend's surrender at Kut in 1916 exemplifies the strength of Ottoman forces in the region, not to mention that it proved an embarrassment for the Allies. Nonetheless, British forces and their Arab nationalist allies regained the initiative and were able to advance in the Middle East, particularly in Palestine, the Caucasus, and Iraq, at the expense of Ottoman forces through 1917 and 1918.

While major naval engagements in World War I did not contribute significantly to the strategic outcome on land, they were still ma-

jor displays of the destructive technology (e.g., Dreadnought-class battleships) available to the major antagonists, primarily Britain and Germany. The Battle of Coronel (1914) off the coast of Chile in Latin America was a major German Kaiserliche Marine victory at the expense of the British Royal Navy. In 1916 the Battle of Jutland, by far the largest naval engagement up to that time, pitted the German High Seas Fleet against the Royal Navy's Grand Fleet near the coast of Denmark. This was an attempt by Germany to break through the British naval blockade in the North Sea and regain access to Atlantic shipping sea-lanes. The outcome of this battle, which took place from May 31 to June 1, 1916, resulted in a strategic win for the Royal Navy in spite of suffering a higher loss of ships and men in contrast with Germany. Nonetheless, Germany avoided engaging its fleet against the British for the rest of the war. However, naval blockades continued to be utilized by both Britain and Germany (who used the strategy of unrestricted submarine warfare on British sea-lanes) and had an impact on supplies of foodstuffs and supplies from abroad.

With the entry of the United States in 1918, the western front shifted from a war of stalemate to one of large-scale operation and offensive on the part of the Entente. German forces from the eastern front were moved to the western front in significant numbers to engage the increasingly large armies buttressed with American units. In the Battle of Amiens, the Battle of St. Mihiel, and the Battle of the Argonne Forest, French and American troops broke through stiff German resistance and advanced with superior numbers of weapons and troops. Along the northern sector, British forces advanced from their positions to take advantage of the German retreats in the south. By November 11, 1918, the guns fell silent as the armistice came into effect, thereby ending four years of carnage and death.

World War I—Propaganda and Espionage

The United States was officially neutral from 1914 to 1917 during the first years of World War I. This policy of neutrality was emphatically supported by the American president, Woodrow Wilson (1856–1924), whose own Calvinist outlook and largely isolationist constituency convinced him that it was not only possible but desirable for the United States to remain above the fray of the European belligerents. American goods, however, especially munitions, were crucial to the success of the Allied war effort. Almost from the beginning, American manufacturers became major suppliers for the Allies. Eventually as U.S. citizens became financially or emotionally entangled in the war effort, the question of American neutrality became a contentious matter. In order to sway American popular opinion to support their war efforts, each side of the conflict launched a campaign of propaganda in the United States. The British worked to make sure that the American government would not be pressured into adopting an arms embargo and thus eliminate their most important source of supply; the German propaganda campaign was designed to stir up support among German Americans, Irish Americans, and other American ethnic groups for such an embargo.

The Wilson administration cautioned the American public to remain strictly neutral but also refused to curtail the American traffic in arms, claiming that neutrality protected such trade. Pro-German groups made every effort to convince Congress to prohibit the export of American-made arms and equipment to the Allies, since the Central Powers were cut off from the United States by the British Royal Navy and so were unable to acquire American supplies. American neutrality thus favored the Allies, and the result within the United States was outrage from a variety of groups including pacifists and ethnic Americans whose families had come from nations now fighting for the Central Powers.

As a result of this controversy, Germany and Great Britain launched propaganda campaigns to sway public opinion in the United States. Although the flow of information to other parts of the world was carefully managed as well, the pri-

As the United States entered World War I, many citizens could not afford the Liberty Bonds that helped underwrite the war effort. Thrift Stamps, sold at 25 cents apiece encouraged children to become involved in the war effort. Many Thrift Stamps were sold by teachers in schools—this explains the fairly mild and nonbellicose imagery of this poster. (Library of Congress)

mary belligerents fought their most concerted propaganda war in the United States. Ultimately, the British were the winners on this front.

Early on August 5, 1914, within hours of declaring war on Germany, the British dispatched the cable ship *Telconia* to cut the telegraph cables connecting Germany to Spain, France, Africa, and the Western Hemisphere. Germany was forced to depend on the international mails and wireless telegraphy for communication with much of the world and was unable to send or receive information without problems. Throughout the war, the British held the advantage in communications and were able to deliver their reports to the American public several days before information arrived from Germany. In addition, within four months of the outbreak of war

the British Admiralty acquired copies of the three primary codes used by the German Navy. The Admiralty's staff quickly became experts at intercepting German wireless transmission.

The politician Charles F. G. Masterman (1873–1927) was put in charge of organizing British propaganda abroad. The result was the creation of the War Propaganda Bureau at Wellington House, a building in Buckingham Gate, London. Each division of the War Propaganda Bureau, known as Wellington House, was responsible for monitoring the press, keeping track of public opinion in the countries in its charge, and providing materials to the foreign press. These materials included articles, official documents, and transcripts of speeches that were specifically chosen to foster a positive view of the Allied war effort. Similar materials were also sent or given to influential citizens in each country, and representatives traveled abroad to follow trends and problems. Sir Gilbert Parker (1862–1932), a member of Parliament and a Canadian who had traveled extensively in the United States, was director of the bureau's American Ministry of Information. The major feature of British propaganda was secrecy. Not even President Wilson was to know that the British were working to influence public opinion in the United States.

German propaganda in the United States was much more boisterous and less subtle. All German activity in the United States was directed and financed by Count Johann von Bernstorff (1862–1939), ambassador to the United States and Mexico since 1908. Von Bernstorff, a popular figure in Washington society, always denied any connection with or knowledge of the activities of German agents in the Western Hemisphere, although intercepted documents repeatedly implicated him in their actions. Only in the 1920s was von Bernstorff's dual role of diplomat and chief of German intelligence established.

Propaganda fell to Dr. Bernhard Dernburg (1865–1937), who entered the United States as head of the German Red Cross but who was actually head of the German Information Service, established in New York in August 1914. German agents in the United States used every possible method to limit the availability or transportation

of munitions, but their methods were frequently heavy-handed or at cross-purpose with the German government. For instance, while the German Information Service was trying to gain the sympathy of black Americans, the government in Berlin was making statements of indignation over the Allies' alleged use of black colonial soldiers against the white European troops of the Central Powers.

Germany's covert activities in the United States were handled by Captain Franz von Papen (1879–1969), the German military attaché at the embassy, and Captain Karl Boy-Ed (1872–1930), the naval attaché. Funds for their operations came from an account, controlled by von Bernstorff, at the Chase National Bank in New York. German agents did not limit their efforts to propaganda; they also engaged in espionage and sabotage to disrupt munitions production or shipping.

British agents in the United States, under the direction of Captain Guy Gaunt (1869–1953), the naval attaché at the British Embassy in Washington, managed to squelch the activities of German saboteurs. Many British agents disguised the actual nature of their work by claiming to be representatives of insurance or engineering companies. Others, including British journalists, were able to combine their official and clandestine duties with less secrecy. Since Great Britain had become the major purchaser of American-made goods, especially munitions, the presence of countless British buyers and technical advisers in the United States was good cover for thousands of British agents, who were careful to avoid any appearance of acting upon instructions from their government in London. The British and the Germans carried their fight to the public of the neutral United States, thus turning the contest to sway American popular opinion into a third battle front.

Armistice

The end of World War I began in mid-July 1918 with the Second Battle of the Marne, the last major German offensive of the war. On July 15 the German Army launched an attack against the Allied positions on the Marne River, a diversionary tactic that was to be followed by a crucial offensive in Flanders against the northern lines of the British Expeditionary Force. On July 18 a massive counteroffensive was launched by French, British, Italian, and American troops under orders from the Allied supreme commander and marshal of France, Ferdinand Foch. On July 20 the German Army began a retreat that took them, by August 5, back to the position from which they had begun their Spring Offensive. On August 8 the final Allied onslaught began; this was known as the Hundred Days' Offensive, and it included the Battle of Amiens and the Second Battle of the Somme as well as the destruction of the Hindenburg Line, making it clear to the German High Command that Germany could not win the war.

In the meantime, the Central Powers were falling apart. Germany's allies were exhausted materially and physically, with too few gains to support their war effort or justify their losses. Their populations were sick of war, hunger, and hardship. Bulgaria was the first of the Central Powers to sign an armistice, ending its participation in World War I on September 30, 1918. Bulgaria's collapse was quickly followed by the collapses of Turkey and Austria-Hungary. Turkey signed the armistice a month after Bulgaria, on October 30.

Germany and Austria-Hungary had sent an official request for an armistice based on Woodrow Wilson's Fourteen Points to the American president on October 4, although their appeal was only the first step. This move initiated a month of often-contentious consultation among the American, French, and British governments

THE "STAB IN THE BACK" MYTH

The myth of *Dolchstoßlegende* ("stab in the back") endured in Germany until the end of World War II. Due to the fact that Germany itself had never actually been invaded and that the treaty concluded with Russia had freed up millions of crack troops who could have been transferred to the western front, many within the German military grumbled that they had been "stabbed in the back" by the new socialist civilian leadership. This sentiment created a great deal of resentment toward the Weimar Republic in a period already riddled with political and economic chaos. In the end, the cause of the armistice was the lack of resources caused by the British blockade, specifically food. With famine killing large numbers of civilians, the newly installed German leadership decided to sue for peace with the Allies. Adolf Hitler and the Nazi Party would eventually exploit this myth, blaming liberalism, socialists and communists, and a powerful world Jewish conspiracy for the loss of the war.

over the terms of the armistice and negotiations between those powers and the Germans and Austro-Hungarians before hostilities officially ended. Among the demands made by the Allies was the insistence that Kaiser Wilhelm II of Germany abdicate. When Wilhelm procrastinated, Germany's new chancellor, Prince Max of Baden, took the initiative and announced the emperor's abdication on November 9. By this time, civil war had broken out in Germany. The kaiser went into exile in Holland, where he spent the rest of his life, dying in June 1941.

Austria-Hungary signed the armistice on November 3. Germany capitulated on November 11 at 5:00 a.m. with the armistice effective at 11:00 a.m. that same day, the 11th hour of the 11th day of the 11th month. A German delegation signed the armistice with the Allies in Foch's railroad car in the Compiègne Forest, near Paris. On June 25, 1940, after France was overrun by the German Army early in World War II, Adolf Hitler would exact his revenge by forcing the French to surrender to Germany in the same railroad carriage in the same forest.

The terms of the 1918 armistice with Germany required the Germans to evacuate all territories they were occupying within 14 days and to surrender 5,000 guns, 25,000 machine guns, 3,000 *minenwerfer* (mortars), 1,700 planes, and all submarines plus other matériel. All other German warships were to be disarmed and interned in neutral ports, under supervision by the Allies. In addition, the left bank of the Rhine River, of crucial importance to Germany, was to be administered by the Allies and the United States, while the right bank was to be designated a neutral zone. The Treaty of Brest-Litovsk, signed on March 3, 1918, and marking the cessation of hostilities between the Central Powers and the Bolshevik Russian republic, was officially repudiated. The armistice was to last for 36 days, after which it was to be subject to renewal. The agreement was regularly renewed until the signing of the Treaty of Versailles on June 28, 1919.

World War I—Paris Peace Conference

The treaty negotiations at the end of World War I were conducted at the Paris Peace Conference, which was officially convened at various locations in and around the French capital city on January 18, 1919, and lasted until January 21, 1920. Although the Treaty of Versailles (signed on June 28, 1919) with Germany was arguably the main settlement of the conference, it was only one of the five treaties that the Allied Powers and the United States negotiated with their former enemies who had made up the Central Powers. The other settlements were the Treaty of Saint-Germain with Austria (signed on Sep-

tember 10, 1919), the Treaty of Neuilly with Bulgaria (signed on November 27, 1919), the Treaty of Trianon with Hungary (signed on June 4, 1920), and the Treaty of Lausanne with Turkey (signed on July 24, 1923). The latter replaced the earlier Treaty of Sévres (signed on August 10, 1920) after the Turkish War of Independence abolished the Ottoman sultanate and rendered the Sévres treaty null and void.

Although the representatives of 32 countries participated in the negotiations, the primary figures at the Paris Peace Conference, known as the Big Four, were the president of the United States, Woodrow Wilson; the prime minister of France, Georges Clemenceau; the prime minister of the United Kingdom, David Lloyd George; and the prime minister of Italy, Vittorio Orlando. Germany, Austria, and Hungary were not invited to send delegates to the conference nor was Russia, having signed the Treaty of Brest-Litovsk, a separate peace agreement with Germany, in 1917. Although it was Wilson's resolute objective to oversee the implementation of his Fourteen Points as the basis for world peace, Britain, France, Italy, and many other nations had serious objections to the adoption of this framework.

Wilson had unveiled the Fourteen Points in a speech he made to a joint session of Congress on January 8, 1918. The first five items were wide-ranging objectives, addressing an end to secret treaties and calling for freedom of the seas, free trade, arms reduction, and arbitration of colonial disputes. The next seven items dealt with territorial issues, most specifically self-determination for the subject peoples of the former German, Austro-Hungarian, and Ottoman empires. The fourteenth item called for a "general association of nations" to protect the political and territorial integrity of all nations and to provide a venue for arbitration to resolve international disputes. This last item became the basis for the League of Nations, established by a separate covenant that was attached to each of the five peace treaties.

The other nations represented by the Big Four—Great Britain, France, and Italy—had war aims that stood in direct conflict with Wilson's idealistic peace plans. Orlando's aims on behalf of Italy at the Paris Peace Conference focused on the promises of territorial gains made in the 1915 Treaty of London. The Italians had joined

the Allies under the condition that Italy would be granted sizable territorial rewards, including most of the Dalmatian coast. Unfortunately, the Allies had made conflicting promises to other nations during the course of the war. Clemenceau put his efforts into protecting France by making certain that Germany was permanently weakened militarily and had to pay large reparations for the reconstruction of northern France. These goals meant that France could not support Wilson's plans for disarmament in Europe. As the representative of Great Britain, Lloyd George aimed for a more delicate balance; Germany should be punished for the deaths of 743,000 British troops but not to the extent that the balance of power in continental Europe was thrown to the French or to the point of crippling the Germans economically so that they were unable to maintain a healthy trade relationship with Britain. At the same time, however, the British had no intention of supporting Wilson's plan for freedom of the seas: the British Royal Navy was central to Britain's national security and to the security of the British empire.

The creation of the League of Nations was crucial enough in Wilson's opinion that he agreed to compromises demanded by Lloyd George and Clemenceau in return for various other points in the postwar settlement. Although 44 states signed the charter initially, the Republican-led U.S. Congress, swayed by politicians hostile to Wilson and concerned that he was bargaining away American sovereignty, would ultimately refuse to ratify the Treaty of Versailles. Therefore, the United States never joined the League of Nations, an omission that would be an important factor in the body's failure over time.

The treaties of Saint-Germain, Neuilly, Trianon, and Lausanne addressed national boundaries and territorial disputes, the protection of the rights of ethnic minorities, troop limitations, and reparations payments. The Treaty of Versailles addressed all of these issues but also included the controversial Article 231, the War Guilt Clause, by which Germany was forced to accept responsibility for having started World War I. Germany also had to agree to pay reparations for damage to civilian properties in the Allied nations. Overall, Germany was forced to sign away territories that included important mineral and industrial

➤ FORGOTTEN TREATIES AND BROKEN PROMISES

During World War I various agreements were made by the Allies with countries in order to convince them to enter the war against the Central Powers. Britain and Italy forged the secret Treaty of London in 1917, according to which Italy was to leave the Triple Alliance and join the Triple Entente. Furthermore, Italy was required to declare war against Germany and Austria-Hungary within a month. In exchange, Italy was to obtain some territorial gains at the expense of Austria-Hungary at the end of the war.

The Treaty of Sykes-Picot (1916) was a secret agreement between Britain and France dividing up the Ottoman empire into British and French spheres of influence after the war. The terms of the agreement, secretly negotiated by the French diplomat François Georges-Picot and the English diplomat Mark Sykes, conflicted with agreements made with Arab leaders in the Hussein-McMahon Correspondences of 1915–1916 that promised independence after the war and with the Balfour Declaration that designated a Jewish homeland in Palestine.

With the coming of power of the Bolsheviks during the Russian Revolution, these treaties, not secrets to the tsarist government, were made public to the world. At the Versailles Peace Conference in 1919, none of the promises made by these treaties came into fruition. Italy did not get all it desired for entering the war, the former Ottoman provinces taken from Turkey were developed into League of Nations Mandates instead of independent Arab states, and no Jewish homeland was developed in Palestine.

—Abraham O. Mendoza

resources as well as population, give up all colonial possessions to the League of Nations, to return Alsace and Lorraine to France, agree to limit the German Army to 100,000 troops, and refrain from manufacturing or importing weapons, tanks, poison gas, artillery, military aircraft, and submarines. In addition, the Rhineland was to be demilitarized and occupied for 15 years by Allied troops, and the valuable Saar mining region was to be administered for 15 years by the League of Nations, with its coal production to be awarded to France. Germany was also forced to

cede the Danzig Corridor, which made Danzig a free city under the administration of the League of Nations while also giving the Poles an outlet on the Baltic Sea but separating East Prussia from the rest of Germany.

Germany protested the harsh terms of the Treaty of Versailles, but the German counterproposals were rejected entirely. The Germans had little choice: they could sign the treaty, or war would be resumed within a matter of hours. Delegates of the government of Germany's new Weimar Republic signed the Versailles Treaty on June 28, 1919, exactly 5 years after the assassination of the Austrian archduke Franz Ferdinand at Sarajevo. The German population was stunned and bitter at the treaty's punitive terms.

Consequences of World War I

Despite the best efforts of the delegates to the Paris Peace Conference of 1919, Europe was not a more stable or a more peaceful place after the end of World War I. Germany, Austria-Hungary, and Russia were embroiled in civil wars as the Great War ended. Many national boundaries had been redrawn or had shifted without regard to the ethnicities of populations, and the Treaty of Versailles was an enormous disappointment to almost everyone involved, either because it was too harshly punitive toward Germany or not punitive enough.

France generally adhered to the latter view. With the destruction of 8,000 square miles (20,000 square kilometers) of agricultural land and nearly 2,000 square miles (5,000 square kilometers) of forest and the loss of more than

250,000 buildings and at least 1.3 million head of livestock as well as a 428 percent increase in the size of the national debt by the early 1920s, France's was a Pyrrhic victory. Despite the return of Alsace-Lorraine and the steps taken in the Versailles Treaty to forestall a German military resurgence in Europe, French premier Georges Clemenceau was voted out of office in 1920, having become a scapegoat for all the things he was not able to achieve at the peace conference.

The French government had promised to pay its citizens for all wartime damages but was unable to do so when the intended source of this money, German reparations payments, proved to be slow and unreliable. In January 1923 French and Belgian forces occupied the Ruhr Valley to take control of German coal, steel, and iron production and make up for the shortfall in reparations installments. The German miners and laborers in the Ruhr responded with work stoppages, and when their government began to print additional currency in order to support the workers, the result was disastrous inflation and the subsequent collapse of the German economy. In the massive wave of unemployment and the dire circumstances that followed, propelling right-wing movements into national support against Germany's Weimar government, Adolf Hitler and the National Socialist German Workers' Party (or Nazis) began their gradual rise to power.

Hitler blamed socialists and Jews for the Weimar government's acceptance of the terms of the Versailles Treaty and for all of Germany's instability and unemployment. He was able to garner a great deal of support from among the ranks of the unemployed, particularly those who had fought in the war and were convinced that Germany had been stabbed in the back by politicians. These malcontents made up the body of his *Sturmabteilungen* (Storm Troopers), who were given the task of eliminating all opposition to Hitler. As Hitler consolidated his power during the 1920s and 1930s, he discarded his plans to seize government by force and entered the mainstream of German politics, but his most devoted supporters remained those who considered Germany to have been too harshly punished for World War I and were determined

that Germany would eventually exact revenge upon its enemies.

Britain ended World War I deeply in debt to the United States. New York had also replaced London as the world's financial center during the course of the war, and with the loss of traditional markets in Germany, Austria, and Russia the British suffered burgeoning unemployment and labor strife. In addition, there was a serious shortage of housing, and the government's wartime promise that postwar Britain would be "a home fit for heroes" proved impossible to keep, giving the British establishment reason to worry that Bolshevism would take hold among the embittered population. By the middle of 1921, more than 23 percent of Britons were unemployed.

Italy had joined the Allies in World War I with the intention of gaining territory, notably the city of Trieste and the Dalmatian coast. When these territorial rewards were not forthcoming after the war, the Italian population considered themselves to have been cheated. In addition, Italy's government was weak and was being weakened further by antiparliamentary political opposition. Out of this erratic situation and economic distress, Benito Mussolini, the nationalist leader of the paramilitary Fasci di Combattimento (fascists), rose to power. His forceful opposition to socialists, anarchists, and communists made him popular with the Italian masses and catapulted him to high political position; he ruled Italy as prime minister and de facto dictator from 1922 to his execution by antifascist partisans in 1945.

The United States fared better economically than its wartime allies, although the Senate's failure to ratify the Treaty of Versailles effectively repudiated President Woodrow Wilson's efforts at the Paris Peace Conference and meant that the Americans never joined the League of Nations, a factor that worked to doom the League of Nations' chances of success over the long run. The United States reverted to its former isolationist approach to foreign policy.

The League of Nations, the international body that was created to enforce peace in the world through diplomacy and collective security, was thus forced to operate without the United States, the newest of the Great Powers and the one least damaged materially by World War I. This absence among the permanent mem-

➤ TREATY OF RAPALLO (1922)

In the years following World War I, various international conferences were held in order to restructure and map the future of Europe. During the Genoa Conference of 1922, representatives from 34 countries met to discuss common economic problems and establish a series of international economic compacts and standards. Outside of Genoa, in the town of Rapallo, representatives from Weimar Germany and the Soviet Union, both considered pariahs by most of Europe, met secretly to come to terms. The Treaty of Rapallo was an agreement made on April 16, 1922, between Germany and the Soviet Union in which each renounced all territorial and financial claims against the other following the Treaty of Brest-Litovsk (in which Germany seized much of the western Russian empire in 1917) and World War I. It also allowed the German Army to train in Soviet territory, in violation of the Treaty of Versailles, with the condition that Germany help instruct the Red Army. While relations between the two countries waned later during the interwar period, it did set a precedent for later collaboration against the West, culminating in the Nazi-Soviet Pact of 1939.

—Abraham O. Mendoza

bership on the League of Nations Council meant that the others—Great Britain, France, Italy, and Japan—were often reluctant to take action or impose economic sanctions against an aggressive nation. Italy and Japan ultimately withdrew from the League of Nations in the 1930s, as did Germany, which had only been allowed to join in 1926. Despite some early diplomatic successes in the resolutions of disputes among smaller countries, the League of Nations proved unable to stop the aggression of these former members and was also unable to prevent the coming of World War II.

■ Introduction: The Second World War

World War II was a global conflict that stemmed from a European-centered conflict that began in Europe in 1939 and a Sino-Japanese conflict that began in eastern Asia in 1937. The ensuing warfare directly affected much of Europe, North Africa, eastern and Southeast Asia, and indirectly affected all other world regions. World War II was the largest conflict in world history, given the amount of troops and war matériel and the vast scale of combat fronts in eastern Asia, the Pacific, Eurasia, and northern Africa. The eastern front, where 6 million Soviet troops confronted 4 million Axis troops over a span of thousands of miles from the Arctic to the Caucasus Mountains, stands as a stark example of the immense scale of the conflict. Moreover, the war led to millions of civilian deaths through the destruction of cities by strategic aerial bombardment (e.g., the firebombing of German and Japanese cities by Allied air forces, the dropping of the atomic bomb on Hiroshima and Nagasaki) and artillery attacks by invading armies (e.g., the German blitz on Polish cities, the Soviet siege of Berlin of 1945). The development of technologies that offered new methods of killing (e.g., Zyklon-B poison gas, the atom bomb, and B-17 Boeing Flying Fortress bombers) also characterized the nature of this global conflict. Moreover, the deliberate systematic destruction of civilians by military authorities in tandem with civilian collaboration, most notably in the Holocaust, was an example of the vast scale of destruction of human life made possible in the context of total war. In contrast, those areas least affected by war, such as the Americas and sub-Saharan Africa, were still heavily involved, providing troops and/or material to the Allies.

—*Abraham O. Mendoza*

Causes of World War II

The causes of World War II stemmed primarily from the 1919 peace settlement that concluded World War I. The Treaty of Versailles resulted in bitterness and unrest within Germany, as it forced

the German government to accept responsibility for the outbreak of war, pay reparations to the Allies, reduce the size of its navy and army, promise not to manufacture munitions, and relinquish territory to other European powers. Failures in diplomacy and the worsening economic conditions that culminated in the Great Depression also spurred Germany's return to militarism.

The failure of world leaders to establish institutions or legislation to ensure peace and security was another factor that contributed to the outbreak of World War II. During the 1920s British prime minister Ramsey MacDonald entered into negotiations with German foreign minister Gustav Stresemann and French foreign minister Aristide Briand to prevent rearmament among the European nations. However, the agreement was compromised when the foreign ministers and prime minister sought to include special provisions that benefited their respective nations. The League of Nations, which was established following World War I, was also intended to prevent conflicts among foreign countries, but each nation attempted to promote its own interests rather than provide collective security. The U.S. refusal to join the League of Nations also weakened its effectiveness. Although 64 countries attempted to end international unrest by signing the 1928 Kellogg-Briand Pact that denounced aggression and outlawed war, the legislation proved futile in preventing renewed conflicts because it lacked provisions for enforcement.

Economic conditions also contributed to the outbreak of World War II. Burdened by the demands of reparations payments and a slow economic recovery, Germany's economy suffered from inflation, which caused the republic's money supply to become nearly worthless. When Germany defaulted on its reparations payments, financial panics and industrial collapse spread throughout the world economies. European nations attempted to stabilize their economies by curtailing imports of American goods and defaulting on their foreign loans. Instead of improving the economic conditions in Europe, these policies contributed to the Great Depression in the United States, which created further

EUROPE, SEPTEMBER 1939

THE UNITED STATES' ENTRANCE INTO WORLD WAR II

Following the outbreak of war in Europe, Americans debated whether the nation needed to intervene in the conflict or remain neutral. During the next two years the United States shifted its policy from neutrality to preparedness. U.S. president Franklin D. Roosevelt supported expanding the nation's armed forces, constructing defense plants, and aiding the Allies. On December 7, 1941, the Japanese attack on Pearl Harbor caused the United States to join the war on the side of the Allied forces.

In the late 1930s the threat of war divided public opinion among most Americans. While isolationists wanted the country to stay out of the international conflict, others known as the interventionists urged political leaders to aid the Allied forces. Nonetheless, Congress passed several Neutrality Acts during the 1930s that reinforced the isolationist movement throughout the nation. In 1939 the U.S. government declared neutrality and stopped all shipments of American arms to warring nations.

Despite the political pressure from the isolationists, President Roosevelt moved the nation closer to war by establishing the National Defense Advisory Commission and the Council for National Defense in May 1940. The president also urged the American public to provide the Allied troops with military supplies through sale, loan, or lease. On March 11, 1941, Congress adhered to Roosevelt's recommendation by passing the Lend-Lease Act.

On December 7, 1941, Japanese forces attacked Pearl Harbor in Hawaii, which destroyed a portion of the American Pacific Fleet. The following day Roosevelt asked Congress for a declaration of

President Franklin D. Roosevelt signs the declaration of war against Japan on December 8, 1941, a day after the Japanese attack on Pearl Harbor. (National Archives)

war against Japan. With only one dissenting vote, congressional leaders voted in favor of war. On December 11, 1941, Germany and Italy declared war on the United States, and the U.S. Congress responded by declaring war on the two countries.

—Kevin M. Brady

economic havoc worldwide. As world leaders struggled with a depressed economy and rising unemployment, they withdrew from world affairs to concentrate on national issues.

The depression also enabled Adolf Hitler to become chancellor of Germany in January 1933. As leader of the National Socialist Workers Party, or Nazi movement, he promised to renew German pride and nationalism. Once in power, Hitler formed a fascist government bent on establishing a new German empire, the Third Reich. By the autumn of 1933 Hitler withdrew German repre-

sentatives from the League of Nations because he believed that the organization did not serve Germany's national interests. Furthermore, Hitler promoted German rearmament and urged German industries to begin producing military equipment. Thus, Hitler's rise to power resulted in a new arms race within Europe.

The economic crisis of the 1930s also impacted Japan by severely limiting its foreign trade. Japanese leaders concluded that territorial expansion would restore the nation's economy by enabling Japan to dominate international trad-

ing routes and gain access to natural resources. In 1931 Japanese forces seized control of Manchuria. This action represented the first step in the creation of a Greater East Asia Co-Prosperity Sphere, which was intended to promote regional economic cooperation under Japanese leadership. When the League of Nations condemned Japan for its actions, Japanese leaders withdrew from the international organization. Japan continued its territorial aggrandizement by invading northern China in 1937. While Japanese soldiers gained control of China's capital city, Nanking, they were unable to defeat the Chinese forces. By the late 1930s the conflict in Asia turned into a war of attrition.

Meanwhile, Benito Mussolini, who seized power in Italy in 1922, embarked on an aggressive imperialistic policy by attacking Ethiopia in 1935. Following the invasion, Ethiopian emperor Haile Selassie called upon the League of Nations to thwart Mussolini's efforts. The League of Nations responded by sanctioning Italy for its actions, but this measure proved futile, as Italian forces easily defeated the Ethiopian soldiers, thus transforming Ethiopia into an Italian colony.

In 1936 civil war erupted in Spain when General Francisco Franco led fascist rebels in an uprising against the Loyalists who supported the existing Spanish republican government. During the insurrection Germany and Italy, which had formed the Rome-Berlin Axis, provided Franco with soldiers and military equipment, while the Soviet Union assisted the Loyalists with limited aid. However, other European nations and the United States did not provide assistance to either side during the conflict. By 1939 Franco's fascist forces defeated the Loyalists and established an authoritarian government in Spain. As the events in Spain unfolded, Hitler noted the reluctance of European leaders to lend aid to the civil war combatants.

Realizing that European leaders were reluctant to become involved in another conflict and believing that they would not interfere with his plans of unifying all ethnic Germans within the Third Reich, Hitler ordered the German Army to reoccupy the Rhineland, which had been placed under French authority by the Treaty of Versailles. In 1936 the German Army marched unopposed into the Rhineland, as French troops

failed to mount any offense against the invading forces. Hitler continued his reunification efforts by annexing Austria in 1938. That same year Hitler targeted the German-populated Sudetenland, which had been granted to Czechoslovakia by the Treaty of Versailles.

Fearing that a war might erupt between Germany and Czechoslovakia over Sudetenland, British prime minister Neville Chamberlain, Premier Edouard Daladier of France, and Mussolini met with Hitler in Munich. At the Munich Conference Chamberlain and Daladier followed a policy of appeasement, which resulted in Germany gaining control of Sudetenland in exchange for Hitler promising not to seek additional territory. Hitler's promise proved short-lived when German forces invaded Czechoslovakia in 1939. Following Germany's success in Czechoslovakia, Hitler made plans to attack Poland. Realizing the ineffectiveness of appeasement, Great Britain and France began to rearm and announced that they would come to Poland's aid if Germany invaded the territory.

Concerned that the Soviet Union might join forces with the British and the French to thwart Germany's efforts to invade Poland, Hitler offered Soviet premier Josef Stalin territorial concessions, including portions of Poland, Finland, and the Baltic States, if the Soviet Union agreed not to wage war against Germany. Although deep animosity existed between Germany and the Soviet Union, the two nations signed a Nazi-Soviet treaty of nonaggression in August 1939. On September 1, 1939, German forces invaded Poland, and two days later France and Great Britain declared war on Germany, thus beginning World War II.

Pacific Theater/Fronts

The Pacific theater of World War II, which encompassed large parts of East Asia, Southeast Asia, and Oceania, pitted the enlarged Japanese Empire (or the Greater East Asia Co-Prosperity Sphere) against the ABCD powers (the United States, Great Britain, China, and the Netherlands) and later the Soviet Union. The Pacific War was launched by Japanese militarists seeking economic and military hegemony in East Asia and the exclusion of Western powers in the region after being diplomatically and economically excluded during the interwar period. The Pacific War began when Japanese forces invaded Peking (Beijing) after provoking Nationalist Chinese forces in the Marco Polo Bridge Incident in July 7, 1937, and ended when Japan surrendered unconditionally to Allied forces on August 15, 1945.

Initial hostilities between Chinese Nationalist forces and the Japanese Kwantung Army began with the Mukden Incident of September 18, 1931, otherwise known as the Manchurian Incident. Japanese agents blew up a section of the South Manchurian Railway near the border of the Japanese concession in order to precipitate war with China over Manchuria. This led to the Japanese invasion of Manchuria and the creation of the puppet state of Manchukuo in 1932. Chinese political disunity in confronting the Japanese and a muted international reaction encouraged further Japanese hostility toward China and, with the provocation of the Marco

Polo Bridge Incident, full-blown war in 1937, six years later after initial confrontation. The Second Sino-Japanese War (1937–1945) that Japan waged on Chinese Nationalists and Communists raged along the Chinese coastal provinces as Chinese forces held onto inland territories and the stronghold capital of Chungking. While Japanese forces were able to hold onto the coastal cities, they faced stiff Chinese resistance farther inland.

By 1940 Japanese ambitions were set also on the acquisition of British, U.S., French, and Dutch colonial possessions in East and South Asia and Oceania. Events in Europe, thought to be distracting most of the world's attention, persuaded Japanese political and military leaders to take the initiative given the fall of France and the Netherlands and Britain's isolation. However, the United States remained engaged in Asian affairs, and the Soviet Union remained a concern for the Japanese. The Japanese had already fought the Soviets in a skirmish known as the Nomonhan Incident on the Manchurian border in 1939. In 1940 the Japanese military was divided between army demands to march against the Soviets and naval demands to engage the United States. It was decided that events in Europe presented Japan the opportunity to attack British, Dutch, and U.S. possessions in the Pacific and so gain raw materials necessary for a prolonged war. However, this southern strategy necessitated Soviet neutrality, which had already been negotiated in September 1939 in the Soviet-Japanese Neutrality Pact. In addition, Japanese forces occupied northern French Indo-China in 1940, given that this was now under the rule of the Axis-collaborationist Vichy French government, an Axis ally, to engage China along another front and also giving it a foothold in Southeast Asia for future expansion.

The bold Japanese attack on the United States at Pearl Harbor on December 7, 1941, and on the British naval base at Singapore the following day, in addition to simultaneous tactical attacks by Japanese forces on Dutch colonies, brought the United States into World War II and Britain into a war against Japan. While these efforts were meant to convince the United States to negotiate its position in Asia, it had the opposite effect and fueled American public opinion firmly for war against Japan. However, much of the following

U.S. Army reinforcements disembark from tank landing ships and proceed across a coral reef toward the beach on Saipan, Mariana Islands, in the summer of 1944. (National Archives)

PACIFIC THEATER, 1941–1945

➤ JAPANESE EXCLUSION—VERSAILLES, THE WASHINGTON SYSTEM, AND THE DEPRESSION

Japan's expansionist foreign policy of the interwar years gradually developed, under a nationalist military clique, in reaction to its perceived exclusion from the Great Powers and the world economy. At the end of World War I Japan, after having vigorously participated on the side of the Entente Powers and captured German possessions in Asia and Oceania, was promptly rebuffed by the Great Powers of Europe. Racist considerations at the Versailles Conference of 1919, particularly by Australia, did not grant Japan the equality it sought as a Great Power. Furthermore, the Washington Treaty of 1922, negotiated by the United States, Britain, Japan, France, and Italy, relegated the British and U.S. fleets to parity and the Japanese fleet to third place among the world's navies. The United States and Britain argued that they needed larger navies given their global commitments and that Japan should suffice with a Pacific navy, given its preoccupation with regional interests. However, Japan saw this as another insult to its Great Power status. In addition, the global economic slump of the 1930s led to increased economic isolation in the form of tariffs, protections, and semiautarky on the part of much of the developed world, thereby closing off supplies of raw materials and markets to Japan and adding fuel to the fire of resentment.

—Abraham O. Mendoza

year consisted of the Japanese dislodging British and U.S. forces from the Pacific region and capturing large numbers of prisoners in the Philippines, the Dutch East Indies, and Burma. In addition, Allied forces retreated to Australia. Official Japanese propaganda painted this war as one of liberation from Western imperialism with the goal of creating an East Asia Co-Prosperity Sphere, an "Asia for the Asians." However, Japanese atrocities against civilians in China, French Indo-China, and the Philippines, among other captured territories, proved otherwise.

The latter half of 1942 proved fortuitous for the Allied Powers after nearly a year of setbacks in the Pacific theater and sustained Japanese offensives. The Battle of the Coral Sea and the Battle of Midway destroyed the majority of the Japanese battle fleet and its adjunct air forces and

put the Allies on the offensive. The year 1943 was marked by intensified Allied attacks designed to dislodge Japanese advances in the Pacific. The island-hopping campaigns that followed allowed U.S., Australian, and British forces to engage Japanese forces through amphibious attacks on important strongholds such as in the Battle of Guadalcanal of 1942–1943. Allied advances in 1944 continued to roll back Japanese advances in South Asia with the goal of establishing air bases closer to Japan to bomb cities and destroy its ability to continue the war. The Battle of Saipan in the Solomon Islands and the Leyte Gulf in the Philippines brought the war ever closer to the Japanese home islands and also brought the beginnings of a sustained aerial bombing campaign. The Allies were also providing Chinese forces matériel through supply routes in recently captured territories in Southeast Asia.

By 1945 most Japanese cities had endured constant aerial bombardment at the hands of the U.S. Army Air Corps Bomber Command as the Japanese military's grip on their empire loosened. The Battle of Okinawa, which lasted from March to June 1945, was the Japanese military's last-ditch effort to deter Allied forces from invading Japan proper. Desperate strategies, such as kamikaze attacks on U.S. carriers, did little to prevent Allied advances. In the Yalta Conference of February 1945 the United States had ensured eventual Soviet participation in the Pacific War subsequent to the end of the European war. The U.S. decision to drop atomic weapons to end the war in August 1945, stemming from fears of massive U.S. casualties in the event of a major U.S. invasion of the Japanese home islands, was also arguably motivated by the upcoming Soviet invasion of Manchuria, China, and Korea. The United States was in effect racing with the Soviets to prevent a similar division of spoils in Asia as had occurred in eastern Europe. Both the Soviet invasion and the U.S. bombs played a significant part in the eventual Japanese surrender of August 10, 1945.

Mediterranean Theater and Fronts

In the Mediterranean theater of World War II, which included the Balkans, Italy, North Africa, and the Middle East, German and Italian forces faced mostly British commonwealth, Free French, and U.S. troops. The Mediterranean theater of operations became crucial to the Axis objective of closing off British access to the Suez Canal, thereby closing off supply routes to the Soviet Union through the Middle East. Furthermore, by locking the Allies out of the Middle East and securing access to oil fields in the Caucasus and Iraq, the Axis could potentially link up with Japan in India much later. British imperial interests in Africa and the Middle East led some Soviet and American leaders to believe that operations in the Mediterranean front were merely to protect the British empire from Axis invasion. However, these operations proved to be strategically decisive; by extracting troops from the eastern front with the Soviet Union, the Allied forces were able to engage the Axis forces on multiple fronts.

The Italian conquest of Abyssinia (Ethiopia) in 1936, in addition to its substantial African forces in Libya, meant that Italy threatened British and French interests in the eastern Mediterranean region. However, Italy did not play a decisive role in German conquests in Europe in 1939 and 1940 but instead played merely a peripheral role in distracting British and French forces in the Mediterranean. Benito Mussolini decided to take the initiative in invading Albania and Greece in late 1940, having stood idly by as his cohort Adolf Hitler conquered most of western Europe. Albania was already a virtual protectorate of Italy and thus an easy occupation for Italian forces. However, the British-backed independent state of Greece was not an easy occupa-

tion, and the Greek Army launched a huge counteroffensive that pushed Italian troops back into Albania.

Simultaneously, Italian troops in Libya were advancing into British Egypt. They were met by a devastating British counteroffensive in December 1940 in the Sidi Barrani region along the Egyptian-Libyan border. Further British offensives destroyed Italian positions in Bardia, Tobruk, and Derna in Axis North Africa. British attacks on Italian positions in the Horn of Africa dislodged Italian power from Italian-occupied British Somaliland and Italian Eritrea and Ethiopia, thereby freeing those countries from Axis rule and capturing large numbers of Italian soldiers. These actions ensured British control of East Africa, the Red Sea littoral, and the Suez Canal and also made Italy vulnerable to Allied attack.

With Italy suffering setbacks in North Africa and in the Balkans, the Germans had no choice but to back their rapidly crumbling ally. In late 1940 and early 1941 Germany sent forces to buttress Italy's retreating positions in Greece and in North Africa. The Germans crushed Greek forces and their British allies and also advanced into Yugoslavia to secure the Balkans for the Axis Powers. In North Africa, the German Afrikakorps, composed of mechanized infantry and tank corps under the command of General Erwin Rommel, advanced steadily against British offensives in Libya.

Erwin Rommel's North African army held British troops in check through most of 1941 and 1942, securing an Axis toehold on much of western North Africa buttressed by Vichy French forces in the West. While Germany sought to capture British positions in Egypt and Palestine and moved up toward the Caucasus region to attack the Soviets, the Italians pushed for the dislodgement of Allied forces in Malta to secure their passage to North Africa. The Germans won out and decided for an all-out invasion of Egypt. However, in the Battle of El Alamein of 1942, a major turning point in the Mediterranean front, the British Eighth Army halted Rommel's North African forces and went on the offensive on a massive front, pushing the Axis back into Libya.

These Allied successes were followed by a massive U.S. and British invasion—known as Operation Torch—on the Atlantic and Mediterranean

► THE HOLOCAUST IN AXIS NORTH AFRICA— THE GLOBAL SCOPE OF THE SHOAH

Many historians of the Holocaust typically refer to the Holocaust as a European event, overlooking German actions toward Jews outside of the European theater of operations. However, events in Vichy French Tunisia illustrate German intentions for Jewry on a global scale. In November 1942 German authorities took charge of Tunisia from Vichy French control and established a local Judenrat (Jewish council), confiscated Jewish property, and extracted huge financial penalties from the local Jewish community, all similar procedures to those practiced in Europe. The Tunisian Jewish community was required to provide money and services for the German occupation. Furthermore, Tunisian Jews were forced to wear the Star of David badge, much like their fellow European Jews. Approximately 4,000 Jews were sent to concentration camps in Tunisia, with some shipped to extermination camps in Europe. Many Tunisian Jews perished through shootings, death marches, starvation, and disease throughout the Axis occupation. This chapter of the Holocaust ended when Tunisia was liberated by the Allies in May 1943.

—Abraham O. Mendoza

coasts of French Northwest Africa. Operation Torch was the second front agreed to by Allied leaders to take some of the pressure off the Soviet Red Army in the eastern front. Soviet leader Josef Stalin reluctantly accepted this Allied operation, which he suspected was part of a U.S.-British ploy of letting the Germans and the Soviets bleed each other to death while the Western allies fought sideshow operations. The Axis forces, distracted with events in the eastern Mediterranean and European fronts, were caught by surprise. While French forces in North Africa loyal to Vichy proved to be an obstacle to Allied advances, arrangements with German-Allied Vichy leaders, highly controversial with Allied domestic public opinion, allowed for Allied movement into Axis-held Tunisia. Troops from the eastern front were brought in to hold this last bastion of Axis power in North Africa, as it was surrounded by British commonwealth and American forces. German

military authorities maintained that it was pivotal to hold this position or risk exposing Italy to Allied invasion. German forces were able to hold off and defeat Allied forces at the Kasserine Pass and stop advances by the British Eighth Army; however, major counteroffensives by U.S. and British forces eventually led to the dislodgement and evacuation of large numbers of Axis troops in Tunisia by mid-1943.

Along with advances in the eastern front, the disengagement of Axis forces from North Africa was a great success for the Allies. It ensured Allied control of the Mediterranean region, which was also assisted by the British and U.S. fleets and their active pursuit of German and Italian submarines. In the summer of 1943 Allied forces began their invasion of Sicily and southern Italy, which was the first successful Allied invasion of mainland Europe of World War II. However, this also allowed for the collapse of fascist power in Italy and subsequent German occupation. In spite of the Italian surrender, German forces held much of the northern portion of Italy for much of 1943 and 1944. Nonetheless, this new front took many German divisions from the eastern front as well as from the defense of the Atlantic Wall, ensuring future advances along the latter fronts in 1944 and 1945.

European Theater and Fronts— World War II

During World War II, the Allies (Britain, the British commonwealth, the United States, and the Soviet Union) confronted the Axis Powers (Germany, Italy, Romania, and Hungary) along various fronts in Europe. In 1940 after the fall of France,

—Abraham O. Mendoza

Poland, and much of Europe to the German blitzkrieg, when Britain faced the full onslaught of Axis forces alone, the English Channel was the only barrier in existence between the British Isles and Hitler's so-called Fortress Europe. Following Germany's Operation Barbarossa directed against the Soviet Union in June 1941, German forces pushed its eastern front in three directions, threatening the Soviet capital and seizing vast territory and resources to feed the German war machine. However, with the entry of the United States in the war in December 1941 following the Japanese attack on Pearl Harbor and Germany's declaration of war, the Allies went on the offensive and encircled Germany, thereby slowly closing in on the grip of the Third Reich on Europe.

Britain, the British commonwealth (Canada, Australia, New Zealand, and South Africa), and British colonial forces (especially India) faced the armed might of the German military across the English Channel in 1940. The Battle of Britain, fought mostly over British skies by the German Luftwaffe and the British Royal Air Force (RAF), was an attempt by the German military to destroy Britain's ability to defend itself and ensure an invasion of the British Isles (Operation Sea Lion) by the German Wehrmacht (Armed Forces). However, British civilian morale and the RAF were able to withstand repeated attacks in

spite of the destruction of various English cities. German attacks subsided as Hitler decided to invade the Soviet Union in mid-1941.

As the Soviet Union was attacked by three major German offensives in 1941 (Operation Barbarossa), it lost huge swathes of territory as well as soldiers and industrial plants to the Axis. As the front stabilized and the Red Army held against the Wehrmacht, the eastern front extended approximately 1,000 miles (1,600 kilometers) into the Soviet Union. This front was further divided into a Northern front along the outskirts of Leningrad, a Central front with the Red Army defending Moscow, and a Southern front along the Volga River and the Caucasus. German forces aimed to seize and raze the major Soviet cities and also sought to incorporate vast tracts of Soviet farmland and industrial plants in order to augment the German war machine. In the South, they specifically aimed to seize the oil fields in Baku.

In 1942 the German command under Hitler decided to attack the city of Stalingrad to gain access to the Baku oil fields and also to destroy the symbolic city named after their ideological nemesis. However, the year-long battle of Stalingrad halted German forces, which had to resort to street fighting rather than field engagement. The Red Army was able to gain the initiative and

COLLAPSE OF GERMANY, 1945

POLAND AND EASTERN EUROPE, 1939–1940

push back the German armies, taking advantage of the winter conditions. The so-called General Winter, which had stalled the German forces back in 1941, was now killing droves of German soldiers because of dwindling supplies and lack of proper provisions for these conditions. With this breakthrough, Soviet forces on the Central front were able to counterattack a German mechanized assault in 1943 in the Battle of Kursk, which was the largest engagement of tanks in world history. This ensured the slow and gradual advance of the Red Army westward back toward the German Reich.

The entry of the United States into the European theater brought huge resources to bear on the German war machine. The Battle of the Atlantic, in which Britain and the United States fought against German U-boats, ensured the provision of American supplies to the Allies. Greater coordination among the Allies after the Tehran Conference in 1943 ensured that the unconditional surrender of the Axis Powers was the ultimate objective. The entry of the United States also led to the preparation of a second front in the West to offset the pressure on the Soviets by Axis forces. Britain, British commonwealth, and U.S. forces, already fighting in North Africa, decided to open up a front in Italy and a subsequent one in northwestern France. Allied forces successfully invaded Sicily and southern Italy, meeting fierce German resistance as they headed north into the peninsula in 1943. Although this front tied down significant numbers of German troops, it did not allow for significant breakthroughs into Europe by the United States and Britain.

However, the Allies had already planned for an eventual attack on northern France for 1944. Through the Normandy Invasion (Operation Overlord) of June 6, 1944, Allied forces rapidly established themselves in northern France after meeting fierce initial German resistance. British and U.S. forces seized the initiative and pushed German forces into central France. By August 25, 1944, Paris was liberated by Allied forces as the Wehrmacht retreated eastward into the Reich. Furthermore, U.S. and British bombing attacks on German cities had intensified to destroy German industrial capacity and morale. The destruction of German cities resulted in great loss

of life and property but did not make a significant dent in German industrial output.

Faced by Britain, the British commonwealth, Free French, and U.S. forces on the western front and the Soviets on the eastern front, the Germans and their Axis allies (some of whom had already sought peace feelers with the Allies) rapidly retreated into their respective rump states as they were pushed back. The Battle of the Bulge, fought in early 1945 on the western front, was a last-ditch attempt by Hitler to deter Allied advances. The attack slowed Allied progress but also destroyed Germany's last reserves in the West; hundreds of thousands of German soldiers began to surrender themselves to Allied forces. As the Allies advanced north from Italy, west from the Soviet Union, and east from France, the German resistance rolled up late in April 1945. In eastern Germany, the slow retreat of German forces eventually culminated in the Battle of Berlin, which was the final attempt to stave off Soviet forces from entering the Nazi capital. German forces were composed primarily of weary Wehrmacht soldiers from eastern campaigns, children, and older men. The Red Army destroyed the last of the German reserves and entered the city in triumph, thereby ending the war in Europe in early May 1945.

Domestic Fronts—Nazi Germany

National Socialist Germany underwent a radical transformation of its home front due to the increasingly destructive impact of bombing attacks on its industrial plants and infrastructure on the part of the Allies after having lost the initiative in its military offenses against the Allies, during which time it suffered relatively little damage. The German home front after 1942 was

► THE DRESDEN BOMBINGS

Among the most notorious instances of Allied bombings of Axis cities are the Dresden bombings of February 1945. Dresden was not deemed an appropriate military target in the same manner as Berlin, Hamburg, and the cities of the Ruhr by the Allied Bomber Command. A vibrant cultural capital city of Germany, coined the “Florence on the Elbe,” Dresden’s strategic location in relation to the eastern front necessitated its destruction in the eyes of the Allied Bomber Command in order to allow the Soviet Red Army a breakthrough in that sector. On February 13, 1945, a huge British squadron of bombers emerged at night over Dresden, cloaked in total darkness due to wartime precautions. By utilizing flares and markers, the bombers were able to see the outlines of the city and their targets. Unleashing incendiary bombs rather than blockbuster bombs, the bombing raid was aimed at unleashing a firestorm rather than a conventional bombing campaign. While civilians were clustered away in shelters, the fire grew in the old city center and its whereabouts. A huge firestorm grew out of control and incinerated those who came into immediate contact with it, burning the oxygen of those who did not. Masses of charred bodies and huddles of asphyxiated dead clustered in bunkers were found in the aftermath. Two further raids, one by another British bomber squadron and one by an American squadron, also attacked, creating massive fire rings that flared throughout the city roads. While the actual death toll of the raids is unknown, various scholars estimate the number to be between 35,000 and 135,000 casualties.

—Abraham O. Mendoza

View of the wreckage of Dresden, Germany, after it was firebombed by the Allies in 1945 during World War II. The bombing, which targeted the civilian population, was one of the most devastating aerial raids in history. Four years after the blaze, the city still appeared as a wasteland; most of its buildings were gutted, including many 1,000-year-old structures that had been completely destroyed. (Library of Congress)

characterized by the daily peril suffered by civilians amid severe bombing attacks on major metropolitan areas, causing significant property damage and civilian casualties. Furthermore, German civilian dissidents were also silenced by the oppressive authoritarian police state imposed by the Nazis to deter so-called defeatist behaviors that might affect public morale.

The rapid advance of the German military in Europe and North Africa in the late 1930s and early 1940s encouraged Adolf Hitler and Nazi Party elites to refrain from imposing restraints on the civilian populations. The Third Reich fo-

cused on military conquests far from the homelands in order to remove the destruction associated with war away from the minds of civilians. These early victories gave the Nazi leadership much domestic political capital, having been able to capture huge amounts of land and resources at the expense of the Allies without having demanded or enforced the austerity associated with total war mobilization. Comparatively minimal damage due to British bombing raids in response to the Battle of Britain (1940–1941) and the Battle of the Atlantic (1939–1945) were exceptions to the rule. However, with the

turn of the tide in 1942–1943 after the Battle of El Alamein (1942) and the Battle of Stalingrad (August 1942–October 1943) in the Soviet Union, the German Army found itself on the defensive, and the civilian populations became fair game in the military objectives of the Allies. The Luftwaffe had illustrated through its own attacks on civilian populations how supposedly effective aerial bombardment was in destroying civilian morale, war industrial production, and infrastructure, as evidenced in Rotterdam, Warsaw, and Coventry.

The home front became increasingly blurred with the battle front in Nazi Germany. The amount of destruction inflicted on civilians, infrastructure, cities, and industrial plants through Allied aerial bombardments was staggering. Swarms of Allied bombers flew over German cities such as Dresden, Hamburg, and Berlin, dropping millions of tons of bombs that were often aimed not only at military targets but at civilian targets as well. In the context of World War II civilians became targets of total war, as they contributed to the continuance of their respective government's aggression. Allied military commanders sought to destroy both civilian morale and Germany's ability to make war, which provided sufficient justification for bringing the war to the home front. Urban civilians had to cope with the day-to-day threat of bombardment by learning to flee at the first sight of bombers or the sound of air-raid sirens, retreating to reinforced concrete underground bunkers. After bombings, civilians had to assist in putting out massive fires before they spread. Firebombings were even more deadly, not only by destroying all the oxygen and often asphyxiating civilians to death but also by charring their already-dead bodies into unrecognizable remains. The destructive toll on factories, buildings, national historic monuments, and the simple dwellings of laborers was massive. The impending defeat of the German military, while troubling to civilians, did not deter them from fighting on. German civilians feared the brutality of the invading Soviet Red Army, inspiring them to fight on to the end in order to prevent the rape of their daughters and other forms of retribution.

Total war allowed the Nazi regime to increase its already tight control on society. In tan-

dem with informers and spies, the Nazi regime and its police forces (most notoriously the Gestapo), rounded up defeatists, critics of the government, and traitors. Widespread persecution of partisans, resistance activity, and even the mild grumblings of a civilian unhappy with his rations was the norm. Notable German dissidents, such as Sophie Scholl of the White Rose movement and the Lutheran pastor Dietrich Bonhoeffer, lost their lives speaking out against the National Socialist government during this ubiquitous persecution. Propaganda minister Joseph Goebbels attempted to mislead the public by purposefully minimizing military losses and disparaging the enemy in the worst light, contributing greatly to German civilian misperception of the progress of the war in their disfavor.

Domestic Fronts—Nazi-Occupied Europe and Satellites

The occupied territories and Axis satellites of the Third Reich found themselves subjected to the political and economic domination of National Socialist Germany and the attacks of the Allies on all fronts. Occupied France, Belgium, the Netherlands, Italy (after 1943), Poland, Norway, Denmark, Greece, Yugoslavia, and vast western provinces of the Soviet Union found their territories subjected to the occupation and subsequent exploitation by the Nazi war machine after having suffered defeat at the hands of the German military. The European Axis composed of Italy (before 1943), Hungary, Romania,

Finland, Vichy France, Bulgaria, and Slovakia suffered a similar fate while willingly subjecting their foreign policy and resources to the needs of the Third Reich and sharing its fate during the Allied advance. However, subjection to Nazi occupation and exploitation led to widespread clandestine resistance in the form of partisan organizations and resistance movements in collaboration with the Allies.

Following the occupation of vast tracts of western and eastern Europe (1939–1942), much of Europe was under German authority. In the west, much of northeastern France, the Netherlands, Belgium, Luxembourg, Denmark, and Norway had fallen to the Germans. In the east, Poland, the Ukraine, the Baltic countries, and much of western Russia had also come under German hegemony. The result was immediate German requisition of goods, resources, and coerced labor to fuel the Nazi war machine. Hundreds of thousands of slave laborers were forcibly taken from their homes throughout Europe and shipped into Germany to work in munitions factories and other work necessary for the war effort. Exposed to widespread abuse, horrible living and working conditions, and bombing attacks by the Allies, slave laborers from the occupied territories suffered lamentable privations throughout the entire war. In addition, many of these occupied countries were subject to heavy taxation in order to contribute toward the Axis war effort. Some countries suffered more than others, given the National Socialist racial hierarchy established throughout occupied Europe. Slavs in the east (Poland, Yugoslavia, Russia) were treated considerably worse than Latins (France, Italy) and Nordics (Norway, Denmark) in the west and north.

Axis allies suffered a similar fate to that of the occupied territories, suffering privations due to their economic collaboration with Germany. Subject to similar authoritarian political structures as those found in Germany, Axis allies extracted tribute and labor from their civilian populations for the needs of the war effort in addition to supplying troops and material for direct military involvement. The extraction of millions of Jews from their territories occurred as a result of the German Final Solution with their active collaboration, although there were exceptions

French civilians walk among German tanks and soldiers in Metz, France, in 1940 after the capitulation. The occupation of France resulted in the imposition of high taxes, forced labor conscription, and other deprivations for the French population. (Library of Congress)

➤ POLISH SLAVERY UNDER THE THIRD REICH

Poland suffered the most out of all the occupied territories of National Socialist Germany, given the proximity of the country, the racial composition (Slavs and Jews) of its people, and its position as a model for occupation to be followed later in the occupied Soviet territories. After its surrender in 1939 Poland was divided into three provinces under German authority (the eastern part was given to the Soviet Union under the Nazi-Soviet Pact): the Wartegau, Danzig-East Prussia (both incorporated into greater Germany), and the General Government. The General Government was established essentially as a slave province where thousands of Poles were forcibly removed from this territory to make room for German settlers and were forced into slave laborers for the Reich. Jewish Poles were subjected to a far worse fate during the *Einsatzgruppen aktions* (mass shootings) in the ghettos and the death camps. Overall, Polish nationals were subjected to widespread abuse and mistreatment under German occupying authorities as slave laborers in Germany and in the General Government, enduring far worse treatment than most other occupied countries.

—Abraham O. Mendoza

to this, notably in Bulgaria. Given their precarious position and fearing direct German occupation and exploitation or Allied aggression, Axis allied governments found themselves subjected to the same fate as Germany at the hands of the Allied onslaught.

Resistance to German occupation and their own collaborationist governments' repression resulted in the creation and activity on the part of various partisan and resistance organizations (French Resistance, Yugoslavian partisans, Ukrainian partisans, etc.). These movements actively collaborated with Allied intelligence to disrupt Axis military movements through covert sabotage operations or through open combat. These organizations provided significant contributions to the advance of the Allies and the eventual liberation of Europe from the Germans.

Domestic Fronts—Japan and the East Asian Co-Prosperity Sphere

Throughout World War II the Japanese home islands and its conquered dominions, known collectively as the Greater East Asia Co-Prosperity Sphere, endured tremendous austerity, oppressive authoritarian rule under the Japanese, and massive destruction at the hands of the Allies, particularly the American forces in the Pacific. The domestic Japanese civilian population suffered from excessive surveillance and deprivations on the part of the government. To a much greater extent Japanese occupied territories—Korea, Formosa (present-day Taiwan), Dutch East Indies (present-day Indonesia), Singapore, the Philippines, Southeastern China, Manchu-

ria, Burma (present-day Myanmar), Thailand, Hong Kong, French Indochina (Vietnam, Laos, Cambodia), and various Pacific islands—and their civilians suffered from military excesses in the form of massacres, widespread abuse, confiscation of property, and forced slave labor. Collectively, they all suffered from Allied military penetration and invasion, leading to massive destruction in Japan proper through aerial bombing raids.

The Japanese home islands were not privy to the devastation of warfare when the Japanese forces were on the offensive throughout the Pacific up to 1942. With the exception of the Doolittle Raid by U.S. bombers on Tokyo (April 1942), civilians remained aloof from the destruction and death associated with war. Wartime austerity due to the lack of food and raw materials for consumer goods was enforced through widespread rationing. The notorious Tokko (thought police) kept close surveillance on the civilian population in order to ensure public subservience to the government's imposition of censorship and to prevent individuals, organizations, and the press from criticizing the war or the government's foreign policy objectives. Japanese civilians were also exposed to the massive influx of slave laborers imported from Japanese dominions abroad to help contribute to the war effort.

The Greater East Asian Co-Prosperity Sphere was created under the Japanese pretense of fighting against Western imperialism (United States, Great Britain, the British Dominions, and the Netherlands) in defense of its fellow Asians and in the hopes of creating an Asian commonwealth under Japanese leadership. This pretension did not mask the reality of the Japanese Empire, characterized by the naked and rampant exploitation of people and resources for the benefit of the Japanese war effort. Thousands of people were forced into slave labor for extracting, producing, and manufacturing goods for the military and for export to Japan proper. In particular, large numbers of Koreans were taken to Japanese manufacturing centers and forced to work for their imperialist masters. In addition, large numbers of women from the colonies were forced to serve as prostitutes for the Japanese military and were popularly known as comfort women.

UNIT 731—JAPANESE BIOLOGICAL EXPERIMENTS ON CHINESE CIVILIANS

The notorious Japanese test facility Unit 731, disguised as a water purification unit based in the Ping Fan district of the northeastern Chinese city of Harbin in Manchukuo, was a covert biological warfare research and development center responsible for some of the most notorious war crimes carried out by the Japanese military during World War II. Approximately 10,000 people of civilian and military status from China, Korea, and Russia were subjects of the experimentation conducted by Unit 731. Test subjects from the surrounding Chinese population, referred to euphemistically as logs, included pregnant women, the elderly, and infants.

Various experiments and dissections were performed without anesthetics out of a belief that it would affect the results. The use of biological weapons researched in Unit 731's biological weapons program resulted in tens of thousands of deaths in China, with some estimates ranging as high as 200,000 casualties. After the war, the U.S. government seized the data from these experiments for usage in its own biological warfare research, causing an ethical controversy over the implications of this action when this was uncovered several decades thereafter.

—Abraham O. Mendoza

Following the military turning point of the Battle of Midway (June 3, 1942), Japan lost the initiative to the Allies and remained on the defensive up to its ultimate defeat in 1945, although on the Asian mainland the Japanese Army continued to make some gains in China as late as 1944, exposing its civilian population to the destruction of total war on the home front. As American forces liberated areas closer to the Japanese home islands, airfields gave the United States the opportunity to utilize long-range heavy bombers on Japanese cities. The American air forces leveled Japanese cities on a wide scale, destroying large tracts of manufacturing facilities, military installations, and civilian housing. These bombing raids brought the war to the civilian population, exposing them to the perils of strafing, firestorms, and massive death. However, these conventional bombing raids, while more destructive, did not capture the same sort of attention by contemporaries as did the atomic explosions at Hiroshima and Nagasaki. The most destructive raid was made by conventional firebombers and came against Tokyo on the night of March 9–10, 1945. Between 80,000 and 100,000 Japanese civilians were killed, and approximately 1 million Tokyo residents were left homeless in the burned-out city. Approximately 8 million Japanese in more than 60 cities were left homeless by the firebombing raids during 1945, with a further count of dead and injured estimated to be several hundred thousand.

Domestic Fronts—China

China was one of many battlefields during World War II, with its domestic experience being defined by fighting, foreign occupation, and migration. While in reality the war for China began when Japan attacked Manchuria in 1931, the Japanese efforts were not transformed into a full invasion of the mainland until 1937. An incident at the Marco Polo Bridge (Lugouqiao) on July 7, 1937, began the second phase of the Japanese attack.

Japan's initial assault on China ended in 1938 after the fall of Wuhan. When the guns stopped, China was divided into ten units, with five of these areas controlled by the Japanese to some extent: Manchukuo, the Inner Mongolian Federation, northeastern China (south of the Great Wall), east-central China, and Taiwan. The

➤ NANJING MASSACRE

After bombing the Guomindang capital, Nanjing (Nanking), for four months, Japanese troops entered the city on December 13, 1937. For the next six weeks rape, murder, arson, and pillaging were inflicted on Chinese troops and civilians in the city. After the war, the International Military Tribunal for the Far East estimated that 200,000 Chinese were killed in Nanjing, including 20,000 female rape victims and 30,000 fugitive soldiers. Reports by Westerners, official complaints, and photographs indicate group and individual killings, repeated rapes, and organized arson and theft by the Japanese Army. Scholars argue that Japanese soldiers were made capable of this behavior through harsh discipline and indoctrinated disdain for the enemy combined with extended bloody fighting in Shanghai immediately prior.

This controversial event has also sparked an international historical debate. In Japan since the 1970s, many conservatives and nationalists deny or downplay the massacre. Some extremists claim that only 100 people were killed and very few raped (although progressive Japanese scholars and most Japanese textbooks support the findings of the International Tribunal). The Chinese and other Asian nations have objected to Japanese revisionism. For instance, in 1982 the People's Republic of China (PRC) protested that the Japanese Ministry of Education attempt to replace the term “aggression” with “advance” and alter the description of the Nanjing Massacre in their state textbooks. The PRC, though, has also politicized this massacre; official organizations such as the Chinese Alliance for Memorial and Justice have inflated the numbers, claiming that 300,000 people were killed.

(AFP/Getty Images)

remaining areas were managed either by independence movements, Chinese warlords, the Guomindang, or the Chinese Communists. The Japanese created a network of puppet regimes rather than one centralized government. Shortages of manpower dictated Japanese reliance on Chinese collaborators such as prominent Nationalist politician Wang Jingwei, who led the Nanjing collaborationist government beginning in 1940. (Wang Jingwei worked with the Japanese in a failed effort to bring the war to an end and

reconstitute a Chinese government in the central and southern areas under his control.)

After their initial defeats, both the Nationalists (Guomindang) and the Communists moved their bases westward, to Chongqing and Yan'an, respectively. As part of their retreat, the Guomindang organized an internal migration in 1937–1938. Entire universities and industries were moved to the south and the west. A total of 639 factories were transplanted to the hinterland, but only 418 resumed production dur-

ing the war. Accompanying the 110,000 tons of industrial potential were 42,000 skilled and semiskilled workers and a similar number of university students. The Southwest Associated University in Free China, for example, was a combination of the relocated Qinghua, Beijing, and Nankai universities. While these efforts composed only a small percentage of China's population and industry, nonetheless it constituted a tremendous achievement made possible by an outpouring of Chinese nationalism.

The majority of China's population, which is concentrated in the east, remained in occupied China. As the Guomindang fled rural areas such as Neihuang County in northern China, chaos ensued. Prisoners broke out of jail, public funds were absconded, and some townspeople engaged in looting and rioting. It took months and the deaths of hundreds before a local militia restored order and gained control from local bandits. This area did not come under Japanese control until 1940. The Japanese enlisted Chinese collaborationists and bandits to run the government and maintain the peace. Not surprisingly, the new government had little public support. In an effort to eliminate resistance, the Japanese with their Chinese allies launched a series of mop-up campaigns in 1941. One of these massacres resulted in the destruction of 141 villages and the deaths of 4,000 civilians. From 1937 to 1945, approximately 20 million Chinese lives were lost. The great majority were civilians such as the villagers living in Neihuang County.

China's leading intellectual centers, Beijing and Shanghai, avoided much of the destruction that ravaged the countryside after 1938. Instead, the Japanese sought to use public figures in these areas to galvanize Chinese support. Initially, Shanghai's International Settlement provided a safe haven for Chinese scholars; however, after the Japanese attacked the United States and British and French territory, Japan assumed control of the area. Despite Japanese attempts, studies of Beijing and Shanghai indicate that the Japanese efforts to use Chinese intellectuals to justify their occupation were unsuccessful. Although among Chinese intellectuals in Shanghai passivity, resistance, and collaboration could all be found, even those engaged in collaboration were generally unwilling to promote

Japanese actions. One example is provided by the writers of *Gujin*, a Shanghai literary journal sponsored by Wang Jingwei's collaborationist government. Their writings, rather than justifying or promoting Japanese behavior, were filled with nostalgia.

In western China the Nationalists and Communists initially formed a second united front to combat the Japanese, but this collapsed by 1941 when armed domestic clashes resumed. The Nationalist wartime policies, in general, alienated many, while hunger and corruption were paramount problems. When the Guomindang established its base in Chongqing, peasants were taxed and conscripted, while health and literacy concerns were ignored. Peasants, frustrated by Guomindang policies in Henan, attacked the military and confiscated its grain in the midst of a famine. Communist land-redistribution policies in Yan'an were far more popular, and as a result their numbers grew from an estimated 40,000 in 1937 to 1.2 million in 1945. However, they were also not without problems. In an attempt to deal with their increasing numbers, Mao Zedong, who attained leadership in the early 1940s, instituted a rectification campaign in 1942. Independent thought and party criticisms were crushed.

In all, the Chinese populace faced varying but scarring wartime experiences as they fought to regain their homeland.

Domestic Fronts—Allies: Soviet Union

The initial phase of World War II for the Soviet Union was accompanied by stunning defeats. Yet in 1939 the Soviet defense industry was large, with more than 1 million employees in four main branch ministries, known as Narkomats (People's Commissariat, NK). The defense industry also was well funded and could produce weapons comparable in design sophistication if not production quality to the Axis. Wartime conscription of the workforce, jail terms for absenteeism, abolition of vacations, and prohibition of voluntary change of employment were decreed by the Supreme Soviet's Presidium in 1940 prior to the start of hostilities. The Achilles' heel for the Soviets was poor coordination between NKs, loss of workforce to the Great Purges, Stalin's obsession with quantity and World War I priorities (battle cruisers, dirigibles, cavalry), and the conservative outlook of his 1930s' military supremo Voroshilov.

With the beginning of the war the system of government was reorganized, with the Gosudarstvennyi Komitet Oborony (State Committee on Defense, GKO) taking charge of all home-front functions, thus sidelining the Communist Party and the Council of Ministers (SNK). GKO tasks were assigned variably, with the main functional responsibilities as follows: I. V. Stalin, chairman; V. M. Molotov, deputy and tank production; K. E. Voroshilov (N. A. Bulganin from November 1944), army reserve and logistics; G. M. Malenkov, aviation; L. P. Beria (from February 1942), research and development, munitions; and N. A. Voznesensky (from February 1942), planning. The GKO also created numerous ad hoc underlying offices and a semipermanent Bureau of Operations, headed by L. P. Beria (from December 1942). Beria's dreaded security police, the NKVD (People's Commissariat of Internal Affairs), was reorganized several times during the war while maintaining control over vast swaths of the economy such as mining and railroad construction. The latest reorganization, in April 1943, carved out the NKGB (People's Commissariat of State Security) and SMERSH (Military Counterintelligence Directorate), which possessed de facto executive pow-

ers in the 60–100 mile (95–160 kilometer) zone behind the front lines.

In the early period of the war, the Soviet Union lost to the German advance areas that previously contained 40 percent of its population and 41 percent of its railroad track and produced 38 percent of its grain and 65–75 percent of its coal and steel. In 1941–1942 defense industries were relocated to the East on an unprecedented scale: 1,360 enterprises (including 455 to the Urals, 210 to Siberia, and 250 to Central Asia), together with more than 10 million evacuees.

By 1943 the Soviet Union was able not only to restore its defense production but also to overcome Nazi Germany in all principal categories of weapons. The Soviet defense output was second only to the United States (\$36.2 billion U.S. to \$13.9 billion in the USSR in 1943). The Soviet technological model presented a stark contrast to Nazi Germany. While the Germans developed many advanced technology designs in small numbers, the Soviets preferred evolutionary improvement of existing mass-produced systems. Programs that did not contribute to the immediate needs of land warfare—long-range bombers, jets, nuclear research, and shipbuilding—were curtailed until the end of the war.

The Franklin Roosevelt administration extended the Lend-Lease Program to the Soviet Union in October 1941, providing aid in the amount of \$11.3 billion. The overall contribution of Lend-Lease to Soviet production of the principal weapon systems was small (aircraft, 13.5 percent; tanks, 6.5 percent) despite the special significance of modern fighters early in the war. However, U.S. and British commonwealth supplies of trucks, tires, motors, foodstuffs (such as the proverbial spam), and nonferrous metals were considered indispensable. These were warmly remembered by Soviet veterans despite official postwar propaganda.

The evacuation at the beginning of the war and construction of the new industrial centers, power plants, and mines in the nearly uninhabitable Soviet East was conducted with total disregard for human costs. Soviet civilians, attacked by the Germans from air and sea, maintained the domestic front under command by brutal and frequently incompetent administrators. Demographic losses of the Soviet Union differ with

► PRODUCTION OF THE MAJOR WEAPON SYSTEMS IN THE SOVIET UNION AND GERMANY DURING WORLD WAR II

Despite the loss of major industrial centers to the German offensive in the beginning of the war and lower prewar output in industrial commodities (coal, oil, steel, etc.), the Soviet Union was able to significantly outproduce Germany in all main weapon systems. Quality of weapons also im-

proved later in the war, as conscripted women and teenagers went through extensive on-the-job training and their rations increased. On the contrary, the quality of German production declined as it lost overseas sources of raw materials and relied more and more on concentration camp labor.

Germany/Soviet Union Units, Thousand	1940	1941	1942	1943	1944	1945	Total 41–45
Tanks and SPG [Self-Propelled Guns]	2.2/2.8	3.8/6.6	6.2/24.7	10.7/24.0	18.3/29.0	4.4/22.6	43.4/106.9
Guns	6/15	22/41	41/128	74/130	148/122	27/77	312/498
Combat aircraft	6.6/8.3*	8.4/12.4**	11.6/21.7	19.3/29.9	34.1/33.2	7.2/20.9	80.6/118.1

*By June 1941, less than 14 percent of the fighters and approximately 22 percent of the bombers of the Red Army's Air Force (VVS RKKA) were state-of-the-art. Mass production of obsolete aircraft continued throughout 1940 and the first part of 1941.

**Actual deliveries to the VVS were much smaller: 3,950 or approximately 4,800 by other estimates.

—Peter Lerner

head count losses by 5 million to 7 million (21–22 million vs. 26–27 million); this discrepancy may be attributable to civilian lives, including those of Gulag prisoners, shortened by starvation, disease, reprisals, and overwork, although this estimate remains controversial.

—Peter Lerner

Domestic Fronts—Allies: The United States and the United Kingdom

Both the United States and Britain experienced drastic social, political, economic, and demographic changes in the midst of World War II

(1939–1945) within the context of their respective home fronts. During this period, the role of the state in the day-to-day operations of the economy, national security, and social stability increased substantially. Daily life was regulated by the needs of war in terms of military conscription, war-industry employment, rationing, and the growing numbers of women in the workplace. Most British civilians entered the conflict with determination and resolve, seeking to muddle through the hardships of the home front. Most Americans entered the war with a fervent disdain of the enemy and spoiling for a fight. In the United States, legislation pertaining to national security was enacted to prevent defeatism and treason by organizations and publications as well as to monitor and incarcerate foreign nationals suspected of aiding and abetting the enemy.

World War II immediately altered the economic condition of both Britain and the United States. Britain, which had entered the war upon Germany's invasion of Poland in 1939, rapidly changed its political leadership from that of Prime Minister Neville Chamberlain to that of Winston Churchill. Churchill recognized the need for placing the government in charge of the economy in order to efficiently engage in

► THE BLITZ—BRITISH LIFE DURING THE BATTLE OF BRITAIN (1940–1941)

Unlike Americans who did not have contact with war on an everyday basis, average people in Great Britain endured and muddled through five years of close contact with the destruction associated with aerial bombardment. The Battle of Britain, devised by Adolf Hitler as a means to destroy the morale of the British people through the destruction of vast tracts of urban neighborhoods, forced urban denizens to seek the protection of underground shelters and brave the mass fires that broke out throughout their cities. The London Underground, London's main subway, was used in particular by many Londoners to escape certain death on the surface during a bombing attack.

Most major British cities in the southeast were exposed to bombing on a regular basis, requiring the citizenry to routinely seek the protection of bomb shelters, fight fires before they spread over greater parts of the city, and essentially endure and accept the pressure of danger on a regular basis. The destruction of vast segments of the East End in London and the near annihilation of the city of Coventry are among the most significant instances of destruction endured by the British people, who were forced to become directly engaged in war as civilians at the mercy of long-range German bombers.

—*Abraham O. Mendoza*

total war, building on the lessons learned from World War I. Through austere regulations on prices, wages, and rationing as well as state regulation and organization of the nation's economic output, Churchill set about implementing strict government oversight over the British economy in the interest of the war effort. American entry in the war followed the Japanese attack on Pearl Harbor on December 7, 1941. U.S. president Franklin Roosevelt, building on the increased role of the state set forth in the New Deal to combat the Great Depression, co-opted big business, big labor, and big agriculture in an economic planning program for engagement on a two-front war against Germany in the Atlantic and Japan in the Pacific. The U.S. war effort required a significant mobilization of society.

Civilian mobilization for war under both the United States and Britain was characterized by mass military conscription, rationing, increased opportunities for women, and massive industrial organization. Such massive mobilization required the creation of huge government bureaucracies to oversee all day-to-day operations and ensure their efficiency. Both countries raised massive armies through compulsive conscription, allowing for exemptions of conscientious objectors. Rationing enforced austere but equitable amounts of food and commodities for average people in the interest of preserving goods for the war effort and avoiding a scarcity of such valuable resources. Average Britons and Americans dealt with rationed goods in the form of limited food options and limited consumer goods, gasoline, and other items deemed as luxuries. The lack of manpower on the home front necessitated a need to include women in the workforce, leading both governments to encourage their female populations to actively join the war industries. Ceding to political pressure, the U.S. government also ordered war industries to begin hiring African American and other minority workers, providing new employment possibilities to these marginalized groups. Such directives spurred black migration north as well as social tensions including major race riots in shipyards and cities such as Los Angeles, Detroit, New York, and Chicago.

Increased government intervention in the economy was also matched by intervention in domestic security. Both Britain and the United States enacted legislation to ensure potential internal and external threats to their national security. Such legislation included censorship of potentially treasonous organizations and publications, routine city blackouts to prepare for possible aerial bombardments (or real in the case of Britain), and the ever-controversial tracking and internment of “enemy” aliens. Government censorship scrutinized and outlawed newspapers and organizations critical of the domestic government or seemingly or even directly supportive of the enemy. Organizations like the British Union of Fascists and the American Nazi Party were almost immediately outlawed at the outset of war. Citywide blackouts were put in effect in most major metropolitan areas, primarily on the vulnerable coasts, in or-

der to prevent the potential threats of enemy bombing attacks. Britain's experience with German bombings during the Battle of Britain (1940–1941) made this procedure particularly crucial in ensuring the day-to-day survival of the urban population. The pervasive threat of enemy infiltration of the homeland also secured the enactment of laws restricting the movements and liberties of potential enemy aliens. In Britain, foreign nationals of German descent were registered and monitored by the government. Internment camps in the Isle of Wight, Canada, and even Australia were set up for the most potentially dangerous. The United States also enacted similar legislation in regard to German, Italian, and Japanese foreign nationals. Japanese nationals on the West Coast were subject to gross civil rights abuses, having their properties and assets confiscated and being sent to inland internment camps in Idaho, Arizona, Arkansas, and central California.

Consequences of World War II

By the end of World War II in 1945, Europe and large parts of Asia were fields of ruins: cities were transformed into heaps of rubble, infrastructures were left in ruins, and factories were destroyed. The war's effects on property, populations, and politics were vast. Moreover, in both Europe and Asia civilian populations were caught in the midst not only of combat but also of occupation policies. In many cases, civilian casualties surpassed military losses. In the end, World War II had caused a degree of moral and material destruction unparalleled in history.

The material impact of World War II is difficult to assess with precision. German occupation policy strained the industrial infrastructures of occupied territories. The output from mobilized factories, mines, railroads, and farms in Belgium, France, the Netherlands, and Norway were channeled toward the German war effort. The monumental size of the destruction brought about by aerial bombardment and combat meant that in defeated states such as Germany and Japan, industrial output simply collapsed. Even in the case of victorious states, the mobilization of national economies meant that industrial output was destined almost solely for military demands, and almost everywhere except in the United States and Canada standards of living sharply declined. In Britain, for example, the country was only able to overcome economic collapse with the help of foreign help; rationing only ended in 1949.

For most contemporaries, though, the impact of the war was measured by the scale and nature of the destruction process. In Europe, few cities were left untouched by either aerial bombardment or the ruthless advance of ground troops. In France, for example, Brest, Caen, and Le Havre were leveled by Allied bombing; in Germany, the cities of Hamburg, Cologne, Dusseldorf, and Dresden were destroyed. Damage was even more severe farther east. The nature of the fighting in the Soviet Union meant that 70,000 villages and 1,700 towns as well as more than 32,000 factories and 39,767 miles (64,000 kilometers) of railroad tracks were destroyed. There was also the damage caused by the firebombing of Japanese cities; 25 percent of Tokyo was destroyed during the night of March 9, 1945. The use of atomic bombs on Hiroshima and Nagasaki was even more devastating. Moreover, 2 million buildings, 31,000 miles (50,000 kilometers) of railroads, and 40 percent of Japanese urban zones were destroyed by American bombers.

Beyond the material consequences of World War II, the human cost of the war is staggering. In the Soviet Union and China, the civilian and military death toll ran into the tens of millions. The most striking aspect of the demographic impact of the war is its effect on the civilian population. Never in such a short time span has a conflict generated such sorrow, misery, and death. Even though the military losses vary

considerably—in some cases, such as in Britain and France, military losses were lower than in World War I—the main characteristic of World War II is the civilian death toll. In fact, in many cases civilian losses far exceeded military deaths. The causes of civilian deaths were numerous: mass extermination by shooting or in concentration and death camps, reprisals for acts of resistance, malnourishment and disease, or simply being caught in the cross fire of colliding armies. The extermination of European Jews in particular proved one of the most shocking consequences of World War II, and by the end of the war almost 6 million Jews had been murdered for ideological reasons.

Combat and occupation, especially in Europe, caused a massive shift in population and sent millions of people on the road. The rapid advance of Soviet troops caused millions of Germans to flee the eastern areas, such as East Prussia, toward inner Germany. They were eventually joined at the end of the war by the millions of foreigners working in Germany in factories and on farmland and by concentration camp survivors.

World War II also brought profound and lasting political changes. At the end of the war France, Germany, and Britain had lost their status as Great Powers. Germany was occupied and ruled by American, British, French, and Soviet occupying forces; France was trying to recover from four years of military occupation and social division; and Britain, although one of the victors and the only country that, with its colonies and dominions, had remained in the fight against Germany since 1939, faced the consequences of six years of warfare. By 1945 the country was basically bankrupt. To sustain the war effort, Britain had borrowed £14 billion during the war, and by the end of the war the national debt totaled more than three times the national revenue. The war effort had basically been more than the national economy could sustain, and in the words of the famed economist John Maynard Keynes, the war for Britain had been a “financial Dunkirk.”

In Asia the two main powers, Japan and China, were in shambles. In China the government of Jiang Jieshi (Chiang Kai-shek) not only resisted reforms toward modernization and liberalization of the state but also was rife with cor-

ruption and was unable to control Mao Zedong's communist forces. By 1945 the country was in the middle of a civil war. The defeated Japan remained occupied and controlled by Allied forces until 1952.

The Allied victory over the Axis Powers also represented the eclipse of the old European power and its replacement by the United States and the Soviet Union, two powers considered to be on the margin of the prewar diplomatic scene. The end of World War II brought an end to the fighting but not to armed opposition. Within two years the world had slipped toward what journalist Walter Lafeber called the Cold War.

Formation of the United Nations

The creation of the United Nations (UN) represented an attempt by the World War II Allies to establish an international organization that would be more effective than the interwar League of Nations had been at mediating international disputes and preventing full-scale conflicts. At the same time, the new organization would promote friendly relations among nations; international cooperation on economic, cultural, social, and humanitarian issues; and further the cause of international human rights. Its architects were much influenced by the belief that during the 1930s nationalist policies, economic and political rivalries, and the absence of amicable international collaboration to resolve outstanding disputes and contentious issues had contributed substantially to the outbreak of war in 1939. They therefore sought to create an institution that could successfully avert similar future conflicts.

UNITED NATIONS EMBLEM

While the major emphasis of the early days of the United Nations (UN) was focused on establishing the institutional framework for the new organizations, some rather mundane issues also had to be resolved. Through a series of revisions, the Sixth Committee of the UN proposed the following description (December 2, 1946): "A map of the world representing an azimuthal equidistant projection centered on the North Pole, inscribed in a wreath consisting of crossed conventionalized branches of the olive tree, in gold on a field of smoke-blue with all water areas in white. The projection of the map extends to 60 degrees south latitude, and includes five concentric circles." The described emblem was approved five days later by the UN.

—H. Micheal Tarver

Even before the United States entered World War II (December 1941), U.S. secretary of state Cordell Hull established a departmental planning group for this purpose. Meeting off of the Newfoundland coast in August 1941, American president Franklin D. Roosevelt and British prime minister Winston Churchill discussed a broad proposal for an international security system in the Atlantic Charter, their declaration of overall war objectives.

On January 1, 1942, the governments of 26 nations fighting Germany, Italy, and Japan issued a declaration by the UN affirming their alliance against the Axis Powers and also stating their commitment to liberal war objectives, as set forth in the Atlantic Charter, and the restoration of the principles of international law. In 1943 both houses of the U.S. Congress also passed resolutions demanding the creation of a postwar international security organization in which, they implied, their own country should take the leading role that it had abdicated in the League of Nations. Meeting at Moscow in October 1943, foreign ministers of the four leading Allied Powers—the United States, Great Britain, the Soviet Union, and China—signed the Declaration of

Four Nations on General Security, pledging in general terms to establish a postwar international organization.

More specific proposals came out of the Dumbarton Oaks Conference of 39 nations held in Washington, D.C., from August to October 1944. These proposals represented a compromise between the ideas of Roosevelt and other devotees of realpolitik, that agreement between the Big Four Allied Powers—"the four policemen"—must be the foundation of postwar international security and that more idealistic popular visions of a world in which all powers, great and small, enjoyed equal status and protection. The Dumbarton Oaks Conference agreed to create a bipartite UN organization, modeled upon the earlier League of Nations but reserving ultimate authority to the dominant Allied states. Any peace-loving state that was prepared to accept the obligations of the UN Charter would be eligible to apply for membership. All member states would be represented in the General Assembly, which would debate, discuss, and vote on issues that came before it. Executive authority rested with the 11-member UN Security Council, which would have 5 permanent members: Britain, France, the United States,

the Soviet Union, and China. The remaining Security Council representatives would be drawn from other UN states, all of whom would serve two-year terms in rotation. Besides providing an international security mechanism, the UN was also expected to promote international cooperation on economic, social, and humanitarian issues.

On Soviet insistence, at the February 1945 Yalta Conference the Allies agreed that each permanent Security Council member should enjoy veto power over all General Assembly decisions. The Soviet Union also obtained separate representation for Byelorussia (Belarus) and the Ukraine. The Yalta Conference further agreed on a UN trustee system to administer both former League of Nations mandated territories—originally colonies taken from Germany and Turkey after World War I—and areas seized from the Axis Powers when the war ended.

The Yalta Conference formally invited all Allied and most neutral powers to attend a conference that would open in San Francisco on April 25, 1945, to establish the new UN organization. Representatives of 51 nations attended this gathering and hammered out the details of the charter of the new UN organization, which accorded smaller states slightly more authority than had the original Dumbarton Oaks proposals. The charter incorporated the International Labor Organization (ILO) established under the original 1919 League of Nations Covenant. To pursue its stated nonsecurity objectives, the charter also created the UN Economic, Social and Cultural Organization (UNESCO) together with the 18-member Economic and Social Council, the Trusteeship Council, and the International Court of Justice. The charter also established the UN Secretariat, which administers the organization. By the end of 1945 all 51 states represented at San Francisco had ratified the UN Charter. In 1946 the body held its first session in London and in 1947 moved permanently to the United States, where its New York headquarters was completed soon afterward.

Although sometimes derided as ineffective and handicapped in international crises by its reliance upon military forces contributed by member states, the UN often provides a valuable forum for the quiet exchange of views and the promotion of humanitarian and social goals. On

occasion it also conveniently furnishes a useful alternative channel of communications among powers whose diplomatic relations were otherwise limited or even nonexistent. While never as effective in terms of resolving international conflicts as its founders envisaged, the UN proved considerably more successful than its predecessor, the League of Nations, in attracting and retaining as members most of the world's major as well as minor states, whose continuing membership implicitly bestowed authority and legitimacy upon the organization's statements and actions.

The Universal Declaration of Human Rights

In 1948, the Universal Declaration of Human Rights determined that World War II's crimes against humanity, such as the Nazi Holocaust and the Japanese Rape of Nanking, must never again be repeated. In 1946 the United Nations (UN) established the International Commission on Human Rights, charging it to draft a Universal Declaration of Human Rights (UDHR). Eleanor Roosevelt, widow of President Franklin D. Roosevelt, chaired a five-member committee, consisting of René Cassin (France), Peng-chun Chang (China), John Humphrey (Canada), and Charles Malik (Lebanon). The committee spent two years drafting the declaration.

Drawing upon the major Western and non-Western political, religious, and philosophical traditions, the UDHR consists of 30 articles. Articles 1–15 are modeled on the French Revolution’s Declaration of the Rights of Man and the Citizen and enshrine traditional political rights of life, liberty, security, and freedom of movement irrespective of race, color, birth, or national origin. Articles 16–30 enumerate the social and economic rights of each person. Inspired by the constitutional tradition of Latin America, the teachings of Confucius, the Quran, and the Papal encyclicals *Rerum Novarum* (1891) and *Quadragesimo Anno* (1931), these articles delineate the special rights of women and children, the right to an education and medical care, and the special protections afforded to the family. Words such as “dignity,” “person,” and “responsibility” are embedded throughout the declaration, thereby ensuring a balance between a person’s rights and civil obligations. Most importantly, for the first time in history the UDHR afforded the individual citizen the right to enlist the moral and legal authority of international law to challenge the laws and the courts of his or her home country.

The UN General Assembly adopted the UDHR on December 10, 1948, with no dissenting votes, although the Soviet Bloc, the Republic of South Africa, and Saudi Arabia abstained from voting. Because the UDHR has no legal standing until ratified by sovereign states, two implementing covenants (treaties) were promulgated to ensure that the 1948 declaration would be ratified by each UN member state. Ninety-five states have signed the first of these covenants, the International Covenant on Civil and Political Rights. Due to concerns about racial equality, social entitlements, and national sovereignty, the U.S. Senate did not ratify this covenant until 1992. Since 1966, 99 states have ratified the second of these covenants, the International Covenant on Economic, Social, and Cultural Rights. Fearful that this covenant might undermine its national sovereignty and deny American courts the right to execute criminals, the U.S. Senate still has refused to ratify this covenant.

Under the aegis of the UDHR, three salutary developments advancing human rights have occurred. First, in the 1960s nongovernmental

Eleanor Roosevelt holding a copy of the Universal Declaration of Human Rights, 1948. (Corel)

organizations (NGOs) began an aggressive and systematic effort to advance human rights throughout the world. NGOs such as Amnesty International, Human Rights Watch, OXFAM (Oxford Committee for Famine Relief), and Médecins sans frontières (Doctors without Borders) joined with religious groups, such as World Vision and Maryknoll, to promote human rights worldwide.

The regional human rights courts established in Europe, Africa, and America are a second promising development in ensuring the rights that the UDHR promotes. The European Court of Human Rights has been the most successful in ensuring that the European Union (EU) monitors human rights within all member countries. The EU has also succeeded in abolishing the death penalty, providing asylum for political refugees, harmonizing European legal systems, developing more uniform immigration policies, and providing a high quality of health care for its citizens. It has been able to find a way to balance the UDHR with its member states’ commitment to national sovereignty, thereby serving as a model for other regional courts.

Finally, the UDHR played a critical role in hastening the collapse of the Soviet Union and its East European empire. In the 1975 Helsinki Accords, the Soviet Union pledged special respect for human rights issues within its own borders and within its East European satellites. At first it appeared that the Soviets were ignoring human

rights issues, but by the 1980s it became clear that Soviet authorities could not ignore the UDHR or the Helsinki Accords, thereby hastening the breakup of the Soviet empire.

Even the most strident critics of human rights have recognized that the moral authority of the UDHR grew considerably in the second half of the twentieth century. As its drafters expressly intended, the 1948 declaration enshrines universal human rights based upon both Western and non-Western traditions; claims that the UDHR is merely a screed for Western imperialism and that there must be cultural exceptions for non-Western cultures, especially in the Middle East and East Asia, have been made but not sustained. Political leaders who trample on human rights are no longer immune from international sanctions. Advances in wireless communications and satellite photography virtually ensure immediate worldwide reporting of human rights violations no matter how determined the perpetrators are to hide the evidence.

The two most effective instruments for promoting human rights remain the UDHR and NGOs. In 1948 Eleanor Roosevelt insisted that the UDHR would be the most powerful voice for human rights for the twentieth century. She also believed that “a curious grapevine” would develop to carry the human rights message to all corners of the world.

—Philip F. Riley

The Holocaust and World War II

The massive destruction of human lives in the Holocaust can only be understood in the context of World War II, the largest and deadliest

conflict in human history. Without that conflict, the Holocaust would not have occurred. This is not to say that the murder of roughly 6 million European Jews and millions of others was a spontaneous wartime atrocity or resulted from battlefield frenzy. Rather, the Holocaust was based on official government policy that used carefully calculated operating procedures to implement racial Nazi ideology and warfare as events developed throughout the war.

The German war effort combined territorial expansion with a belief in the need for so-called racial purification. “Race and space,” Doris L. Bergen wrote, were “related goals” of that effort. In Adolf Hitler’s view, the Jews were the root of all evil, and Germany could only be saved from collapse by the total destruction of Jews and Jewish influence. War was not only desired but also necessary to redeem the Germans through racial purification and the acquisition of *Lebensraum* (“living space”) for the so-called superior Germanic or “Aryan” race. The antithesis of the Aryan was the Jew along with all others deemed racially inferior by the Nazis, including Gypsies (the Roma and Sinti), Jehovah’s Witnesses, and homosexuals. This intersection of war and genocide lies at the heart of National Socialist beliefs, something that Hitler had already revealed in his 1925 work *Mein Kampf* (*My Struggle*).

After Hitler came to power on January 30, 1933, acts of racial purification were initiated against the Gypsies, the disabled, and the Jews, the primary target group of the Nazis. In the period leading up to World War II, these actions intensified. Similarly, Hitler’s foreign policy grew increasingly aggressive. Jews were economically boycotted and banned from the German civil service in 1933 when Hitler also initiated Germany’s secret rearmament. He ended the secrecy around Germany’s rearmament only two years later, in 1935. This was also the year of the Nuremberg Laws, which forbade Jews and Aryans from intermarrying and attempted, for the first time, to define who was to be considered a Jew in Nazi Germany. In 1938 the Germans annexed both Austria and Czechoslovakia and organized the so-called Kristallnacht (“Night of the Broken Glasses”), the first massive and openly organized physical attack on Jews by the state.

World War II molded a more systematic and destructive alliance between race and space. In August 1939 the Germans invaded Poland, instigating war with Britain and France. The invasion in Poland was accompanied by massive killings of Jews through pogroms, starvation, and mass shootings by the so-called Einsatzgruppen ("Intervention Groups"), special mobile units of the Schutzstaffel (SS) and the Order Police (police units with military training and equipment). At the same time, deportations were organized to concentration camps and ghettos, where Jews were isolated from the world. In the spring of 1940 Germany invaded and conquered Norway, the Netherlands, Belgium, and France. Only Great Britain was able to check the Germans in the West, but this was of little aid in preventing the murderous activities against Jews in the East.

In June 1941 the Germans opened their attack on the Soviet Union and immediately began to organize pogroms and even more systematic killings of Jews and others. The war against the Soviet Union, also known as Operation Barbarossa, intensified the killing of Jews. In September 1941 Jews in German-occupied Europe were obliged to wear the Star of David. The next month, deportations began of the Jews from Germany and western Europe. Then, in December, the first killing camp was created, located at Chelmno, close to Lodz (Poland). Here gas vans were used to kill Jews and Gypsies.

Most of the fighting between 1941 and 1943 took place in the East, where the Russians were able to halt the Nazis during the Battle of Stalingrad from August 1942 to February 1943. Stalingrad was a decisive turning point, but it did not slow down the killings of Jews; on the contrary, it actually speeded them up. Initial plans to deport the Jews of Europe to Madagascar or deep into the Russian landmasses were made impossible by Allied military resistance.

The decision to exterminate all Jews, however, was not taken until January 1942 at the Wannsee conference. After the conference five more killing centers were created, all of which, like Chelmno, were located in Poland. These camps were Belzec, Sobibor, Treblinka, Majdanek, and Auschwitz-Birkenau, which had initially been created as a killing center for Soviet prisoners of war (POWs) in the summer of 1941.

➤ HOLOCAUST OR SHOAH?

The term "Holocaust" derives from the Greek "holókauston" (λόκαυστον), which means "a sacrifice totally burned by fire." In the 1960s the term "Holocaust" started being used in the Anglo-American world to refer to the systematically planned extermination of as many as 12 million people during Germany's Nazi regime from 1933 to 1945. Critics of the term "Holocaust," however, often point to the religious connotation of the term "sacrifice." They argue that it falsely makes sense of and gives meaning to the senselessness and randomness of the victims' deaths and war experiences. In addition, since Nazi policies were not religiously motivated but instead were sustained by pseudoscientific and racial social Darwinist ideas, the term "sacrifice" is not only morally ill-suited but also historically incorrect. Therefore, critics of the term "Holocaust" often prefer the Israeli use of the (Hebrew) word "Shoah" (catastrophe) to denote the German murder of Jews during World War II. In Israel, the Knesset (the Israeli parliament) has designated an official day, called Yom ha-Shoah, as a day for commemorating the systematic killing of Jews. In France too, one often uses the term "Shoah" rather than the term "Holocaust." These criticisms notwithstanding, most people in the world are more familiar with the term "Holocaust" than with "Shoah." To them the word "Holocaust" refers primarily to the actual historical event rather than to the inherent meaning of the term. For that reason, the term remains both useful and significant.

—Steven Schouten

Although the murder of Jews continued to be characterized by confusion and bad coordination, the erection of these killing centers proved enormously efficient, especially in 1942 when the annihilation of Jews reached its absolute peak. At the beginning of 1942, 75 percent of the Jews who would be killed during the Holocaust were still alive; however, by the beginning of 1943, 75 percent of the approximately 6 million Jews who would be killed were dead. Though the relative numbers of Jews killed declined after 1943, the killings nonetheless continued until the end of the war. Even when it

was clear that the war was lost, the Germans decided to transport a large number of Jews and Gypsies from Hungary to Auschwitz, many of whom did not survive the war. In the summer of 1944 when the Hungarian Jews arrived, Germans in Auschwitz were killing as many as 12,000 Jews a day. Despite Allied knowledge from intelligence sources of the systematic murder of the Jews of Europe, as it was not part of their strategy for the defeat of the Axis, next to nothing was done on behalf of European Jewry.

■ Introduction: Nationalist Movements and Conflict

The first half of the twentieth century was a period of national awakening, increased struggle for national identity against Western colonial powers, and, quite often, conflict with rival ethnic groups and their liberation movements. Societies living under colonial rule suddenly became acutely aware of their lesser position. By and large, the awareness spread from the Western-educated native middle classes to the masses of peasants and workers. These national movements, which successfully captured the imagination of the great majority of the population in Africa and Asia, achieved their final goal of decolonization. The process of emancipation started with the independence of India, achieved in 1946, and was followed by scores of countries achieving independence during the following decade.

Although local circumstances varied from one country to another, these national liberation movements have some common elements. Many of their leaders were Western-educated, for example: Mahatma Gandhi, David Ben-Gurion, Menachem Begin, Ho Chi Min, and Sukarno. Quite often, their education called attention to the discrepancy between lofty proclamations embedded in Western culture about freedom and equality for all men and the practice of denying those rights to colonized peoples. This inconsistency exposed Western ethnocentrism, the underlying intellectual foundation of the civilizing

mission, the so-called White Man's Burden, and the implicit racism it entailed.

The second common element shared by all national liberation movements was the influence of various forms of socialism including the most popular, Marxism. Marxism, as the most comprehensive critique of the laissez-faire economy and state-driven imperialism, was a natural ally of those seeking to overthrow the colonial rule of Western powers. Furthermore, from 1919 to 1943, the Communist International Organization (the Comintern), funded by the USSR, also provided the nascent national liberation movements with sympathetic allies, often an important element in the struggle. Public opinion in the West often managed to limit imperial governments' more drastic actions against liberation movements. Marxists in the West, on the other hand, were often very slow to respond to the challenges posed by national liberation movements. The movement was dominated by either Trotsky's ideas of a world revolution, which emphasized a revolution in industrialized Western countries and ignored the less developed Asia and Africa, or Stalin's isolationism and building of socialism in only one country. Orthodox Marxism also saw nationalism as a reactionary bourgeois movement and rejected it. As such, the USSR kept a safe distance from liberation movements in the Third World until the death of Stalin.

Third, many national liberation movements were put in a very difficult position by the two world wars when they had to pick and choose allies without actually having an influence in the conflict. The most difficult situation was in Asia, where the empire of Japan openly courted national liberation movements in eastern and southern Asia by promising them help in their struggle against Western imperial powers. Gandhi famously pointed out that India was dragged into the war, which was fought for freedom and against oppression, while the same freedoms had been denied to millions of Indians. Many other nationalist leaders were much less generous than Gandhi. Their reluctance to help the Allies was not motivated by an affinity for the Nazis but rather by local considerations and the fact that distant theaters of operation in Europe and the Pacific did not influence them directly, while colonial injustices dominated their daily lives.

Finally, World War II economically and politically wore out the greatest imperial powers, Great Britain and France, making their resistance to independence movements, with some notable exceptions, feeble and difficult to sell to the population at large because of the high cost involved. When the war ended in 1945, there was no stopping the national liberation movements in Asia and Africa, as many nations achieved their goal of formal independence very quickly.

Nationalism in the Ottoman Empire

The Ottoman empire was a dynastic multiethnic, multireligious, and multicultural state. The rise of nationalism within the empire combined with the interference and economic imperialism of European powers together with limited Ottoman response was instrumental in the collapse and disintegration of the empire during the nineteenth century. In addition to the founding of new nation-states, this period also witnessed ethnic cleansing, mutual civil violence, and mass migration.

In contrast to common misconceptions and stereotypes, intercommunal relations in the Otto-

man empire remained good and relatively peaceful compared to other European states until the beginning of the nineteenth century. Having their own legal system and wearing distinctive clothing, different communities had lived and worked together for centuries. Despite the primacy of Islam in a region in which religious identity was extremely important, the communities within the empire did not live completely separated from each other. This does not mean that the Ottoman empire was free of conflict or had established eternal peace within the country. Rather, instead of being the result of intercommunal hatreds, the occasional rebellions and unrest were mainly the result of socioeconomic concerns, financial issues, or the ambitions of local notables.

The origins of nationalism in the Ottoman empire are very problematic. For example, even the Serbian rebellion of 1804, which was instrumental in establishing an autonomous Serbian principedom in 1817, began not as a nationalistic revolt but rather as a reaction to the administrative corruption and abuses in the region. However, it is obvious that after the foundation of the Greek national state in 1829, nationalism became the most important issue in the European portion of the Ottoman empire. The initial reaction of the Ottoman administration was piecemeal and limited, showing a lack of understanding of this new development. Traditional military-administrative methods to combat sporadic rebellions and popular unrest not only increased the dissatisfaction for ethnic groups but also created an outcry in Europe and gave additional excuses for the interference of the Great Powers, which was ultimately instrumental in the success of the nationalist movements.

Religious identity and the foundation of separate churches obviously had a significant effect on Balkan nationalism, but other infranational identities on tribal and local levels were also important. Nationalist intellectuals—trained in Europe or missionary schools—became the ideologists and leaders of the independence movements, and these individuals contributed greatly to the national consciousness of their respective ethnic groups. As a result, the various ethnic groups began to desire the creation of mono-ethnic states within the highly cosmopolitan

Balkans, thereby resulting in wide-scale ethnic cleansing and intercommunal fighting. The conflicting interests of the nationalist movements subsequently became especially apparent in regions like Macedonia.

After 1878 nationalism began to also affect other parts of the empire. Following in the footsteps of the new Balkan nations, Armenians and Anatolian Greeks started their nationalist movements. Due to the predominantly Muslim population in Anatolia they initially asked for reform and autonomy, although they later called for independence. In contrast to Christian communities, nationalism tended to not affect Muslim communities until the end of the nineteenth century. Even after this date Muslim communities accepted nationalism somewhat reluctantly, as their nationalism remained essentially a defensive character and therefore did not contribute to the dissolution of the empire.

The Ottoman governing elite and intellectuals began to develop several supranationalist ideologies in order to fight against the nationalist movements and the Great Powers' interference after the 1840s. The first of these new ideologies was the secular and multiethnic "Ottomanism," which basically tried to combine the different groups and regions under the Ottoman flag by providing equality to all citizens in order to gain their loyalty to the dynasty and state. Even though the disastrous Ottoman-Russian War of 1877–1878 had showed clearly the failure and naïveté of this ideology, it remained the backbone of official policy in a somewhat downgraded form until the end of the empire. After World War I, a new ideology under the leadership of Sultan Abdulhamid II was devised: "Pan-Islamism." The basic idea behind this ideology was to unite Muslim communities in an effort to prevent further loss of territory; however, the movement had to be limited in scope so as to not alienate the non-Muslim communities. Abdulhamid tried to gain the loyalty of Muslim groups by creating a new elite through enlisting local notables into the central administration and by opening special schools in various corners of the empire. In the end, Pan-Islamism achieved limited results.

The loss of nearly all of the European territory of the Ottoman empire after the Balkan War

of 1912 led to a significant influx of refugees from the Balkans and the Caucasus. At the same time, the rise of Albanian and Arab nationalism aroused deep suspicion about the loyalties of non-Turkish Muslim groups. In response, the new military-dominated governing elite, Ittihad ve Terakki (Committee of Union and Progress), formulated a more sustainable and viable ideology: "Pan-Turkism." In actuality, it was an imported ideology first devised by Tatar intellectuals from Russia as a literary movement to unite Turkish people to combat Russian imperialism. While Pan-Turkism primarily targeted Turks within the Ottoman empire, it also unofficially appealed to Turkish groups outside the empire, especially those under Russian dominion.

Even though most of the members of the governing elite accepted Pan-Turkism as a viable solution, it never officially replaced Pan-Islamism and Ottomanism. The lack of a consensus and popular support created confusion from the top to the bottom of the imperial administration. This lack of unity could explain the conflicting and controversial policies of the different members of the government at that time. During World War I, all three supranational ideologies failed to achieve the unity that the empire needed. While the absence of the Christian-minority communities' contribution to the war and the Armenian rebellion proved the failure of Ottomanism, the Arab rebellion and the lack of response to jihadist proclamations shattered all Pan-Islamist hopes of enlisting Muslims against "Christian aggressors." The failure of a last-minute advance in 1918 toward the Caucasus did not satisfy even the most ardent Pan-Turkists. In the end, however, these failures provided a suitable environment for an Anatolia-centered Turkish nationalism that became the official ideology after the foundation of the Turkish Republic in 1923.

Palestine

Palestine between 1900 and 1945 was a dynamic place, due in large part to a demographic shift brought on by Jewish immigration. The land of Palestine was bordered to the north by Syria and Lebanon, to the east by Transjordan (now Jordan), and to the southwest by Egypt. Although the territory had areas of fertile land that supported the existing population, changing Ottoman land laws shifted land ownership, leading to the impoverishment of many Palestinian peasants.

The population of Palestine according to the 1922 census was approximately 752,048 people. Of these, 589,177 were Muslim, 83,790 were Jewish, and 71,464 were Christian. It is difficult to find accurate numbers concerning the Arab Jews who were residing in Palestine prior to the East European migration, as the Ottoman government did not account for Arab Jews. However, it is clear that the population rose steadily, with the total population in 1942 being more than 1 million people.

In the mid-nineteenth century, the Ottoman government instituted the Tanzimat (Reorganization) reforms in an attempt to modernize its empire in response to increasing British and French pressure. These reforms included an increase in taxes and the number of conscripts for the Ottoman Army. This led to many Palestinians signing their land over to a sheikh (leader) who would then be responsible for conscripts and taxes for the entire village, thus lessening the load on the individual families. This new land tenure system with its absentee owner became an important factor in the early 1900s, when the Jewish National Fund (JNF) was established to purchase land for future Jews. The JNF had been established in 1901 and by the 1920s was a considerable force within Palestine vis-à-vis land ownership, holding approximately 25,000 acres (10,000 hectares). It was on JNF money that Tel Aviv was established.

From World War I (1914–1918) onward, most of Palestine's history can be understood via diplomatic documents and their effect on the land and its peoples. During the war, the Ottoman empire sided with Germany and Austria. Because of this, the British and French attempted to foment unrest within the Ottoman territories. The first attempt at this was through the Hussein-McMahon Correspondence (1915) whereby the British envoy, Henry McMahon (1862–1949), approached the sharif of Mecca, Ali ibn Hussein, asking him to begin a revolt among the Arabs in the empire in exchange for sovereignty over the Arabs in the former Ottoman provinces.

Shortly after the Hussein-McMahon agreement, the British entered into the Sykes-Picot Agreement with the French. This pact divided former Ottoman provinces into spheres of influence, with Britain retaining roughly the areas of Egypt, Palestine, Transjordan, and Iraq and France entering into Syria and Lebanon. This was the part of the template for the mandates formed following World War I.

In 1917 the British further enmeshed themselves in Palestinian politics with the Balfour Declaration. This document, addressed to one of the world's foremost and wealthiest Jews at the time, Lord Rothschild, explained that the British government was supportive of the establishment in Palestine of a national home for the Jewish people. Shortly after this declaration, the immigration of Jews to Palestine increased dramatically, causing a strain on the local economies and general civil unrest. This immigration was caused by ethnic conflict in Europe, pogroms in Russian controlled areas, and the rise of Nazism in Germany.

Following the Treaty of San Remo (1920) and the Treaty of Sèvres (1920), the Jews in Palestine believed that they had achieved power and thus began organizing cohesive political groups led on the Left by Chaim Weizman and then David Ben-Gurion and on the Right by Vladimir Jabotinsky and then Menachem Begin and Yitzhak Shamir. The Arabs in Palestine were also divided into two groups fighting on the basis of family, the Nashashibis and the Husseinis. However, with the ascension of Haj Amin al-Husseini to the position of grand mufti (spiritual head) of Jerusalem, the family's rivalry was ensured, and nationalist feeling superseded cohesion.

After 1920 violence spiraled out of control throughout Palestine. Riots began soon after the Balfour Declaration was made public. British support for Jewish immigration into Palestine had been waning since the 1920 riots, when Winston Churchill issued a White Paper (a British government memorandum) arguing that the number of immigrants should not overwhelm the existing population. This sentiment was echoed and strengthened in the 1929 Passfield White Paper but was not put into policy until another White Paper in 1939.

The Jewish leadership believed that the British were cooling in their support at about the same time as persecution was rising in Europe. In response, they began increasing emigration numbers as much as possible. This led to another Arab Revolt in 1936 in which, for the first time, the Arabs formed an organized and cohesive group. They revolted against the British mandate government by attacking Jewish settlements, and it took more than 20,000 British troops to contain and end the violence. This final revolt led the British to send the Peel Commission to Palestine. The commission concluded that partition was the only answer to the violence. At this point, the Jewish leadership officially split between the Irgun, led by Begin, who wanted to oust the British and the Haganah, led by Ben-Gurion, who preferred cooperation over conflict. The Arab leadership was decentralized during this period, but they were satisfied for a short time with the 1939 White Paper that curtailed Jewish immigration.

Soon after, World War II broke out in Europe, and Britain was forced to defend itself against the Axis Powers of Germany and Italy, leaving Palestine and its violence unattended and the 1939 White Paper unenforced. Violence continued until the 1948 Israeli War of Independence, when Israel declared and won its independence.

Nationalist Movements in India

Indian nationalist movements developed in opposition to the British colonial occupation of the region. Indian nationalism grew increasingly restive against British rule the more apparent it became that the British were only going to relinquish control of India slowly and reluctantly. Although they were unable to win their independence, the 1857 rebellion was an important rallying point for Indian nationalists. Around the turn of the twentieth century, newly assertive leaders included the "Lal, Bal, Pal" trio: Lala Lajpat Rai (1865–1928), Bal Gangadhar Tilak (1856–1920), and Bipin Chandra Pal (1858–1932). The Asian victory in the Russo-Japanese War (1904–1905) boosted the confidence of Indians to resist the British. The abrupt partition by the British of Bengal in 1905 between the predominantly Muslim eastern region (which would become East Pakistan in 1947 and then Bangladesh in 1971) and the majority Hindu West Bengal proved provocative. In response, extremist nationalists such as Sri Aurobindo Ghose (1872–1950) organized the Swadeshi movement, a boycott of British cotton textiles. Some Indians turned to violent means to free India from British control including Vinayak Savarkar (1883–1966), who helped establish India House (1905–1910) in London and whose followers carried out assassinations of British officials and later even nationalist rival Mahatma Gandhi (1869–1948). During World War I, Germany provided aid to young Indian nationalists, including Virendranath Chattopadhyaya (1880–1937) in Berlin and members of the Ghadar (Rebellion) Party among Indian immigrants in San Francisco. Other revolutionaries, such as Manabendra Nath Roy (1887–1954),

worked with Vladimir Lenin and the Soviet Union to found the Communist Party of India in 1920.

The almost 60,000 Indians killed fighting for Britain in World War I made significant contributions to the Allied war effort on the western front and in the middle east, where they captured Baghdad. The British rewarded this loyal sacrifice in 1919 with the disappointing Montagu-Chelmsford Reforms and the Amritsar Massacre, where troops under the command of British General Reginald Dyer killed 379 and wounded more than 1,200 peaceful protestors at Jallianwallah Bagh, an enclosed market with only one entrance.

Counteracting the British strategy of divide and conquer proved to be a difficult challenge during the independence movement, as it fed communal strife between Hindus and Muslims. Nevertheless, the Lucknow Pact (1916) between the Indian National Congress and the All-India Muslim League allowed for the concession of separate electorates for Muslims in order to get Muslims and Hindus to work together against the British. Both groups of Indian nationalists continued to cooperate during the early 1920s to support the Muslim Khalifat (Khilafat) movement as it merged with Gandhi's Anti-Rowlatt Satyagraha campaign. Despite increased pressure for independence as a result of the Great Depression, the British were able to divide the revolutionaries further by giving a separate electorate to lower-caste Hindus.

Although most Indians remained loyal to the British during World War II, the conflict added new motivation for independence. The Congress, split between conservative and radical factions on the eve of the war, was embarrassed when the British declared war again on behalf of India without bothering first to consult with them. Even the moderates under Gandhi and Jawaharlal Nehru (1889–1964) then opted to withdraw support from the British, choosing the Quit India campaign that resulted in the largest civil disobedience campaign since 1857. In his 1908 pamphlet *Hind Swaraj (Indian Self-Rule)*, Gandhi made the point that a few hundred thousand Englishmen were able to hold on to millions of Indians only because the Indians let them. With

➤ MOHANDAS K. "MAHATMA" GANDHI'S SALT MARCH SATYAGRAHA, 1930

Satyagraha (Sanskrit for "grasping for truth"; also translated as "soul force") was Gandhi's technique of nonviolent civil disobedience that he developed on behalf of Indians toward the British in South Africa. Its success required well-trained, law-obeying, obedient, self-disciplined volunteers who openly picked a single unjust law to break, accepting all consequences including violent reprisals and jail. The hope was that focusing public attention on that narrow issue and by highlighting its injustice would elicit support among a wider public and even among those within the establishment charged with enforcing the law. Through the use of nonviolence Gandhi sought not just to win but also to achieve a genuine consensus by awakening compassion in the oppressor; he saw nonviolence as an ultimately quicker method for achieving an objective than using violence to force one's opponent superficially to do one's will.

On March 12, 1930, Gandhi started his 240-mile (385-kilometer) almost month-long march to the sea from Ahmedabad to Dandi to break the British salt law that taxed this vital substance. After a highly publicized march, on April 6, 1930, Gandhi and thousands of his followers defied the government through the simple act of making salt from seawater. This high point in Gandhi's career landed him in jail yet again but gained widespread sympathy for the Indian independence movement.

—Douglas T. McGetchin

simple refusal to cooperate, Indians could force Britain from India. The British responded to Quit India by throwing Gandhi and the Congress leadership in jail. The loyalist Muslim-majority provinces played little role in Quit India, foreshadowing the postindependence Indo-Pakistani split. Netaji (respected leader) Subhas Chandra Bose (1897–1945), once president of the Congress, took an even more radical path. Under house arrest at the war's outbreak, he escaped first to Nazi Germany and then imperial Japan, where he organized the Azad Hind Fauj (Indian National Army) among Indian prisoners of war, leading them in the Burmese campaign against

the Allies. Further eroding British support was a massive famine that struck Bengal in 1943–1944, killing around 3.5 million as the British neglected to provide relief.

In the Lahore Resolution (1940), Mohammad Ali Jinnah (1876–1948) took a public stand in favor of the partitioning of British India into an independent Pakistan and an independent India. Although Gandhi deeply opposed such partitioning, he agreed to it in 1944 with the hope that the two future countries could at least form a coalition. Independence for Pakistan (August 14, 1947) and India (August 15, 1947) was marred by the violence of one million refugee deaths, as riots accompanied the Muslims who fled from India to Pakistan and the Hindus who fled from East and West Pakistan to India. Ambiguities remained in regions such as Junagadh and Hyderabad, which had Muslim leaders and Hindu populations, while the opposite situation occurred in the border region of Kashmir.

During the four decades from 1905 until the end of World War II, Indian nationalists made significant strides toward independence. Leaving moderation behind, many became increasingly radicalized, yet Gandhi and other Congress leaders managed to direct most resistance along nonviolent paths of peaceful noncooperation and economic boycott. Still, deep disagreement existed among revolutionaries about how to free India from the British: through violence or more moderate noncooperation. Despite the lingering religious communal rivalry that rent the region creating a separate Pakistan and shattering Gandhi's hopes for unity, South Asians did gain independence from British rule.

Nationalism in Burma

Burma's modern nationalism emerged in the form of the Dohbama Asiayone (We Burmans Association, or Our Burma Association), founded in 1930. This new association replaced the Buddhist-sponsored nationalism of the Young Men's Buddhist Association (YMBA) of 1906. The Dohbama Asiayone was composed mainly of students from Rangoon University and discussed a diverse range of nationalist and state philosophical trends with which to strengthen Burma and ultimately free the country from British rule. Among the group's members was Aung San, father of today's resistance icon Aung San Suu Kyi, who was to become the key figure in the independence movement until his assassination on July 19, 1947. As a symbol of resistance, members addressed themselves as *Thakin* (master), an address employed by the British colonial masters. Gradually, Marxist reading gained ground, and on August 15, 1939 (sometimes dated 1943), the communists within the Dohbama Asiayone founded the Burma Communist Party (BCP) with the aim of forming a united anti-imperialist front and gaining freedom by destroying British capitalism and imperialism.

The Burmese communists adopted the anti-imperialist line, even though in the face of the rise of fascism the Communist International (Comintern) had decided in 1935 to suspend the struggle against imperialism and fight fascism (Dimitrov line). Ideologically, imperialism was seen as a necessary stage in capitalist development. Fascism, then, appeared as capitalism in a state of crisis that embarked on an imperialist war to overcome the crisis.

In July 1941 the BCP leadership turned anti-fascist with the Insein Manifesto, drawn up while they were jailed in Insein. Going against the Dohbama mainstream, this manifesto called for a temporary cooperation with the British, especially after Great Britain and the Soviet Union had become allies against fascist Germany. The mainstream Dohbama initially ignored this move

and instead cooperated with the Japanese—who had conquered Burma from Great Britain—in an effort to gain independence. Indeed, on August 1, 1943, Japan declared Burma to be independent; however, the reality was that this independence was in name only. At that point the Burmese resistance followed the communists and cooperated with the British to turn against the Japanese. A united front according to the Dimitrov line emerged in August 1944 in the form of the Anti-Fascist Organization (AFO). On August 19, 1945, the AFO was renamed the Anti-Fascist People's Freedom League (AFPFL).

In February 1946 the BCP split into two factions, subsequently known as the Red Flags and the White Flags. The Red Flags, led by Thakin Soe, assumed a radical line, whereas the White Flags, led by Thakin Than Tun, maintained the moderate cooperative strategy endorsed by Georgi Dimitrov in 1935 and stayed within the AFPFL after World War II. On July 3, 1946, Soe's radicalism led Sir Henry Knight, then the governor of Burma, to outlaw the Red Flags and the closely associated Red Flag Labour Unions and Red Flag Cultivators Unions.

In late September 1946 in the midst of strikes, a governor's executive council was appointed. The AFPFL was allocated 6 out of 11 seats. Aung San became deputy chairman, a position resembling that of a prime minister. Four months later Aung San and Britain's prime minister Clement Attlee agreed to form an interim government in preparation for Burmese independence. By April 1947 the White Flags began to take an increasingly radical posture. They first boycotted the April 1947 general elections for delegates to the Constituent Assembly; however, they eventually contested 28 seats of which they won only 7. The AFPFL won the remaining 248 seats.

From the start the AFPFL had problems of maintaining unity. This factional problem was carried into independence and contributed to the instability of the political system throughout the 1940s and 1950s. On January 4, 1948, Burma gained independence under an AFPFL government, with U Nu (1907–1995) as prime minister. Two months later the White Flags decided to go underground and attempt to overthrow the government by revolution.

Nationalism in French Indochina

In Vietnam a modern nationalist movement emerged at the turn of the twentieth century with the actions of Phan Boi Chau, a member of the class of scholar-officials, or literati, who were influential through their rise in the imperial bureaucracy, which was staffed by officials graduating within the Confucianist imperial examination system. The nationalist movement, of which Phan Boi Chau was the figurehead, tried to reform the monarchy but then changed to the advocacy of a republican system, underpinned by Neo-Confucianism.

The abolishment of Sino-Vietnamese education, the introduction of a modern Western curriculum, and the abolishment of the imperial examinations by the French colonial authorities by 1919 saw the decline of the scholar-officials and their nationalist movement. Instead, the nationalist scene radicalized, and in 1925 Ho Chi Minh founded the first communist organization in the whole of French Indochina: the Viet Nam Thanh nien Cach mang Dong chi Hoi (Revolutionary Youth League/Association of Revolutionary Young Comrades/Association of Revolutionary Youth), commonly known as the Thanh Nien party. Although the organization was founded in exile in Guangzhou (Canton), China, its members were infiltrated into Vietnam to organize communist cells.

In January 1930 Ho Chi Minh, staying in Hong Kong, merged the Thanh Nien with two parties operating within Vietnam into the Dang cong san Viet Nam (Vietnamese Communist Party). In October 1930 its name was changed to Dang cong san Dong Duong (Indochinese Communist Party, ICP) to allow for the participation of Laos and Cambodia. The party's headquarters were relocated to Haiphong. In order to acquire an additional network after the suppression of the ICP in the early and late 1930s, in 1941 mem-

bers of the Vietnamese communist refugee community in China's Guangxi province founded the Viet Nam Doc Lap Dong Minh Hoi (League for the Independence of Vietnam), better known as the Vietminh, chaired by Ho Chi Minh. The Vietminh acted against both Japan and France at a time when the French Vichy regime was allied with Nazi Germany and France and Japan were engaged in the suppression of resistance activities in Indochina.

The Japanese attack on French Indochina resulted in a power-sharing arrangement between Japan and France: on August 30, 1940, the Japanese government recognized French sovereignty over Indochina, while France recognized Japan's military control of the colony and agreed not to interfere with Japan's expansionist plans in East Asia. By December 1941 Japan had taken military control over the whole of Indochina, and Indochina became effectively included into Japan's Greater East Asia Co-Prosperity Sphere. France was officially left in sovereignty and to administer the colony. Mounting French resistance to increased Japanese control, however, led to the Vietminh switching sides to France against Japan. In response to French resistance, the Japanese dissolved the French administration and took complete control over Indochina in the coup de force of March 9, 1945.

In the following months the Japanese restored nominal independence to Vietnam by restoring Emperor Bao Dai to full authority, while the Japanese kept military control. Before the coup de force, in March 1945, Bao Dai had been allowed to extend his authority to Tongkin through a viceroy (who was checked by Japan), and in July the French concessions in Hanoi, Haiphong, and Tourane had been dissolved. On August 8, 1945, the Japanese agreed to hand Cochinchina to the Bao Dai government. However, Bao Dai was unable to fill the power vacuum that was left by the absence of French administration.

The vacuum that was created enabled the Vietminh guerrilla forces to operate more easily and expand their influence over Tongkin. In August 1945 the surrendering Japanese gave full authority over Tongkin to Viceroy Phan Ke Toai. The Allied-backed Vietminh, arriving in Hanoi, informed the viceroy of their taking over the gov-

ernment of Tongkin. In Cochin, China, where the ICP network was destroyed, a united front government led by Vietminh forces took over. The abdication of Bao Dai in Hue, in agreement with the Vietminh government in Hanoi, put the Vietminh in charge of Annam. A national government was formed and independence declared on September 2, 1945. The attempt of France to re-establish the French Union in Vietnam led to a guerrilla war of the Vietminh, which was settled at the Geneva Conference in 1954.

In Cambodia a modern nationalism did not take hold until the 1930s and was based on historic affiliations to the Angkor period and religious affiliation to the Buddhist sangha. The first Khmer-language newspaper, *Kambuja Surya*, was published in 1936; however, it belonged to the Institut Bouddhique founded by the French authorities, which was supposed to give Buddhism a national focus, an action also pursued in Laos. The first signs of anti-French resistance emerged in the 1930s through the French-sponsored Lycee Sisowath, which brought about a small Cambodian elite, the Institut Bouddhique. The sangha and the newspaper *Nagara Vatta*, founded in 1936, since 1940 had become increasingly anti-French, anti-Vietnamese and pro-Japanese as Japan promised independence from France. The paper was eventually suppressed in 1942. It was not until the start of the Japanese occupation of French Indochina that anti-French feelings broke out. This was created by increased suppression of Vichy France, allied to fascist Germany, throughout French Indochina; seizure of Cambodian territory by Thailand in the Franco-Siamese War of 1940–1941; clashes between French authorities and Cambodians during the monks' demonstration in July 1942; and attempts by France to Romanize the Cambodian alphabet between 1943 and 1945. The Japanese coup de force resulted in Tokyo urging King Sihanouk, who had ascended to the throne in 1941, to declare independence within the Greater East Asia Co-Prosperity Sphere, which he did on March 13, 1945. After the Japanese surrender in August 1945, Sihanouk declared full independence. In October an Allied force occupied Phnom Penh and entered into negotiations with Sihanouk. On January 7, 1946, an agreement was reached to grant Cambodia autonomy within the French

Union, effectively re-creating the French protectorate over Cambodia. In 1954 Cambodia became fully independent.

While Vietnamese nationalism became increasingly radical and Leftist-leaning, in Laos, as in Cambodia, nationalism took longer to develop, and communism was absent—except in some instances among the Vietnamese minority—until the late 1940s. Nationalism appeared first during the reign of King Rama IV as linked to the monarchy and Buddhism. To wean Buddhist thinking away from Siamese affiliations, the French authorities set up Buddhist institutes in the 1930s. French-supported creation of a Lao national history, history textbooks and newspapers in the Lao language, introduction of national symbols as well as designs of unification of the country by the king of Luang Phrabang between the 1920s and 1940s—thus the creation of a secular nationalism—furthered the idea of Lao nationalism against the tendency of looking to Thailand. During the process France pronounced that by establishing the protectorate it had saved Laos from destruction. The Indigenous Consultative Assembly, mostly consisting of members of the provincial councils but also containing a French-educated aristocratic elite,

gave Laos the idea of having a national deliberation body. The overthrow of the French administration in Japan's coup de force led to the declaration of Lao independence under Japanese auspices. After the Japanese surrender an elite resistance group, the Lao Issara (Free Lao), managed with the help of the Vietminh—which similar to Cambodia in the absence of communism cooperated with the present noncommunist resistance forces against a French return—to install a government, which however was ousted by advancing French forces. In the following years, the protectorate over Laos was essentially re-created, as an independent state within the French Union, until Laos gained full independence in 1954.

Nationalism in China

By 1900, economic penetration of China by imperialist powers had become advanced. China was a semicolony under the stipulations of the treaty system, a number of so-called unequal treaties that the government of the Qing dynasty was forced to conclude with imperialist powers. A number of abortive attempts to initiate reform of the Confucian state during the second half of the nineteenth century in order to strengthen the Chinese state, the military, and the economy against the threat of imperialism (such as, for instance, along the lines of the Meiji Reform in Japan) eventually led to the defeat of the Chinese Army in the Japanese-Chinese War in 1894–1895

and showed the shortcomings of the moderate reforms of the Self-Strengthening Movement (ca. 1861–1894). The Hundred Days' Reform (1898), initiated through petitions by the scholar-official Kang Youwei to the Guangxu emperor, was stopped by conservative circles at court, led by the Empress Dowager Cixi. This further weakened the Qing vis-à-vis imperialism, and attacks were increasingly launched against the dynasty by radical nationalists. Among the nationalists were Sun Yatsen, who criticized the inability of the Qing to strengthen China and who also focused on the foreign (Manchu) origin of the dynasty. This development ended the reformist nationalism of the 1861–1898 period with its goal to moderately reform, but essentially keep, the multiethnic state held together by Confucianist morality. Reformism was replaced by a Western-style nationalism in which a nation-state corresponds with an ethnic homogenous population and a common language within precisely defined borders. This was the birth of anti-imperialism, which would eventually topple the Qing dynasty.

In order to recover from its defeat in the Boxer Rebellion, the Qing decided to move forward with reforms, including the abolishment of the Confucian examination system for the civil service, the introduction of Western-style schools, the remodeling of Confucian academies into Western-style universities, the introduction of Western-style military academies, and the introduction of a constitution for local and central administrative reform and a constitutional monarchy.

The Qing dynasty was eventually overthrown in 1911, and on January 1, 1912, the revolutionaries set up a republican government with Sun Yatsen as provisional president. As the Qing had not yet abdicated, this was a rival government. The dynasty asked its supreme commander, Yuan Shikai, to negotiate a settlement. At its end stood the abdication of the Qing in February 1912 and the yielding of the presidency to the autocratic Yuan. Led by Sun Yatsen, the nationalist Guomindang, a merger of several revolutionary organizations including Sun's Tongmeng Hui, could not prevent this autocratic transformation. In 1915 Yuan tried to make himself emperor, but the plan was opposed and finally wrecked by the provincial

Chinese nationalist leader Sun Yatsen in 1923. (UPI/Bettmann/Corbis)

leaders and the Guomindang. Yuan died in 1916, and the country fell apart into zones of influence under provincial warlords. The power of the warlords was due to the military empowerment of the provinces through decentralization measures in the wake of the Taiping Rebellion (1851–1864).

Whichever warlord was in charge of Beijing was dealt with by foreign countries as the government of China. The government that was in place in Beijing in the spring of 1919 was confronted by the May Fourth Movement, with its nationalist aim of ridding China of imperialist interference. On April 30, 1919, the results of the Versailles Treaty to end World War I were announced. The stipulations of the treaty forced Beijing to hand the formerly German Shandong to Japan instead of China. At the same time, it became known that Beijing also had agreed to Japan's 21 demands, a blueprint for Japan's expansionist ambitions in China. These events resulted in widespread demonstrations and violence against pro-Japanese cabinet members, foreigners in general and Japanese citizens in particular. The protests peaked on May 4, when a student was shot by the police; this was followed by a wave of nationwide strikes. The protests became known as the May Fourth Movement (*wu si yundong*). On June 12, 1919, the government resigned.

In 1921 the Chinese Communist Party (CCP) was formed in Shanghai, with the May Fourth Movement serving as the catalytic process for its formation. Committed to a nationalist cause—with communism as the ideology—to rid China of foreign domination and rule of the bourgeoisie (which in its view was cooperating with the imperialist exploiters), the CCP was to become the Guomindang's main foe and ally at different stages in the history of the Republic of China.

The disappointment about the outcome of the Versailles conference discredited the Western democratic countries and instead led China's left-wing politicians and intellectuals to look toward the Soviet Union as a successful example of how to achieve peace and strength. After Sun's death in 1925, the ideological conflict between the Guomindang and the CCP became unbridgeable. Jiang Jieshi (Chiang Kai-shek), who came to succeed Sun in leading the Guomindang, was a strong anticommunist and focused more on wiping out communist activity rather than joining forces with the CCP against Japan in the Sino-Japanese War (1937–1945).

In the full civil war that broke out after Japan's surrender, corruption and economic mismanagement eroded the urban support for Jiang Jieshi, and military defeats despite military support from the United States eroded the morale of his army. The CCP, however, enjoyed popular

Nationalism in German East Africa

At its core, nationalism is a political ideology—developed by nineteenth-century European middle-class intellectuals and state builders—that asserts that a nation, a people, or an ethnic group is the primary element of human social life and that each nation is entitled to its own sovereign state. In this sense, the term “state” refers to a political community that occupies a definite territory, has an organized government, and is self-governing. Modern theories of nationalism, however, contend that national identity and unity were not the result of spontaneous popular desires but instead were invented or imagined communities carefully crafted by politicians seeking greater control over a state's economy and society. In colonial territories such as German East Africa, ease of governance involved a divide-and-conquer strategy. Tanganyikan, or Tanzanian, nationalism was not promoted by the German state. Indeed, it was

actively subverted, and the autonomy of the existing ethnically based states, such as the Hehe and Nyamwesi, was not respected. Nevertheless, the actions of the German colonial government inadvertently created conditions for the so-called invention of Tanganyikan nationalism under later British rule.

The people who lived in what became German East Africa after 1889—present-day Tanzania, Rwanda, and Burundi—were quite diverse and privileged local loyalties and identities. In the interior were mostly Bantu-speaking and politically independent ethnic groups who lived mainly by crop farming (the Hehe, Ngoni, Kimbu, Makonde, Chagga, and Myamwesi) as well as the Nilote-speaking Masai herders. On the coast, Swahili-speaking Arabs and Africans had long engaged in commerce and were nominally subject to the sultan of Zanzibar, while Hindu-speaking Indians were deeply involved in commercial activity. Around 1900 the densely populated kingdoms of Rwanda and Burundi came under the protection of German East Africa. Rwanda and Burundi had developed a class structure similar to medieval Europe, although the aristocrats were drawn exclusively from the Tutsi ethnic group (about one-tenth of the population) who ruled over the mainly peasant-farmer Hutu and from whom they exacted taxes and labor services. Paramount chiefs who acknowledged German suzerainty were confirmed in office and ruled as representatives of the German government, whereas in Burundi, Rwanda, and Bukoba German government representatives became residents (advisers) to the kings who kept control over the administration of their state. The main task of the chiefs outside the kingdoms was to collect a hut tax, organize a workforce for German plantations, and muster workers for road construction projects and cultivation of new crops.

Uprisings against the German intruders were common. Before 1900 the major revolts were the Abushiri Rebellion (1888–1890), the Uzigua Revolt (1890), the Nguru Revolt (1891), the Nyamwesi Rebellions (1892–1894), and the Hehe Resistance (1891–1898). These uprisings were not based on a sense of shared ethnicity or nationhood but instead were based on multiple grievances against the new German rulers: new

taxes, disrespect for Islam, disregard for sovereign African polities, and generally brutal treatment. Although the Nyamwesi and Hehe were ethnically based and highly organized African states, they had no rituals, myths, or institutions creating a national allegiance. While the uprisings in the colony before 1905 were often confined to single ethnic groups organized into autonomous states (re)asserting their traditional independence against German claims to suzerainty, the Maji Maji Rebellion that began in July 1905 in the Rufiji River valley was a new form of resistance to colonial rule: this mass movement of protest against the hut tax, forced labor on roads and plantations, and autocratic local officials swiftly spread across dozens of ethnic groups in the southern third of the colony. Using religious rather than national belief as a motivating force, the uprising began among the Matumbi, a stateless people without a traditional structure of centralized leadership, who sought to regain their independence and to resist the forced cultivation of cotton. The Matumbi rubbed holy water (*maji*) from the prophet Kinjikitile onto their bodies in the belief that it made them invulnerable to German bullets. By July 1907 the revolt was put down in a scorched earth policy that devastated the southern half of the colony and depopulated large areas of it.

Other rebellions followed (e.g., the Turu Rebellion of 1908, the Chagga uprising of 1909) but none of the anticolonial uprisings from 1889 to 1914 were framed in the language and ideas of nationalism. They were local movements of resistance to direct exploitation and German cultural, political, and economic incursions. Germans were in fact reluctant to educate native Africans in more than the rudiments of reading, writing, and arithmetic needed for working in the colonial economy. The Germans feared that education would make Africans presumptuous, give them notions of equality with Europeans, and provide a common language (German) that could unite Africans across linguistic and ethnic lines against the German Reich and thus create a modern nationalist movement. In the belief that the power of Europeans was based on their literacy and numeracy, starting in 1907 local chiefs and sultans set up schools to educate Africans, and while these independent schools

often aimed to improve Africans' positions in the colonial hierarchy, they also educated future national leaders.

Tanganyikan nationalists, in the process of creating national myths in the 1950s and later, argued that the Maji Maji Rebellion was the first inkling of Tanganyikan (later Tanzanian) nationalism. Later historians have challenged this view, claiming that the rebellion was not a unified Tanganyikan or Tanzanian movement but rather a series of revolts conducted by a large number of ethnic groups, or nations. Tanzanian nationalism and the imagined community it created did not cross the historical horizon until the late 1940s. It certainly did not exist in German East Africa. What did exist were the clan-based states and the feudal states of Rwanda and Burundi, which were ethnically based lineage states but not national states in the modern sense. The Maji Maji Rebellion did, however, provide an example of united mass action upon which later Tanganyikan and Tanzanian nationalist leaders would draw.

The Khaksar Movement

The Khaksar Tehreek (Khaksar Movement) was a grassroots volunteer organization founded in 1930 by Allama Mashraqi, a Muslim leader who sought a unified India. The objective of his movement was to bring freedom to British India by inculcating discipline, unity, brotherhood, and social service among its followers. The movement quickly gained popularity, and its supporters grew into the millions by the end of the decade.

The movement brought awareness among the masses in India and played a role in mobilizing the nation for independence. Mashraqi ultimately disbanded the movement on July 4, 1947.

The Khaksar Movement's philosophy was defined by 24 principles and a 14-point decree and stressed character building and equality. Community service was also an integral part of the movement. In addition, there was a spiritual side to the movement that encouraged Khaksars to seek self-purification and placed special emphasis on collective prayer. Although members were primarily Muslim, the movement also included representation from the Hindu and Sikh communities.

While the movement's philosophy instilled mental discipline, the organization's day-to-day activities imparted physical discipline. The Khaksars held daily parades in which members marched in khaki uniforms and carried spades, symbolizing the dignity of labor and the leveling of society. Along with their daily parades the Khaksars also periodically held mock wars and camps in various cities in India, designed to mobilize the nation to seek freedom from British rule.

During the 1930s the Tehreek rapidly increased in numbers. In 1934 it initiated its own weekly newspaper, *Al-Islah*, to spread its message. By the end of the decade the Tehreek had expanded throughout India and had international offices in Burma, Bahrain, South Africa, and Saudi Arabia. As the Khaksar Movement grew in popularity, the government viewed the movement as an increasing threat to its rule in India and thus imposed greater restrictions on the movement. On March 19, 1940, Khaksars marched on the streets of Lahore in protest of the government's restrictions, leading to a clash that resulted in a number of Khaksar deaths and injuries. Following the clash the government banned the movement and raided its headquarters. Mashraqi, his sons (one of whom later died of an injury sustained during the raid), and a number of other Khaksars were arrested, resulting in widespread demonstrations by fellow Khaksars in protest of these actions.

After Mashraqi's release, he and the Khaksars intensified their campaign and applied pressure tactics for Indian independence. The group

➤ ALLAMA MASHRIQI (1888–1963)

Inayatullah Khan, known as Allama Mashriqi (Allama Mashraqi), was born in India on August 25, 1888. He received an MA in mathematics from Punjab University (India) and then joined Christ's College at Cambridge University (England). Mashriqi authored many books throughout his lifetime, the best known of which is *Tazkirah*, which was nominated in 1925 for a Nobel Prize for its commentary on the Holy Quran. Upon his return to India from Cambridge, Mashriqi joined the Education Department and served in various positions, including undersecretary. In 1930 he resigned from government service and started the Khaksar Movement (Khaksar Tehreek) to seek freedom for British India. For the next three decades he remained a frontline politician and was arrested on a number of occasions for political reasons. Mashriqi died in Pakistan on August 27, 1963. His passing was widely mourned, with more than 100,000 people attending the funeral and procession.

—Nasim Yousaf

(Nasim Yousaf)

pushed for Hindu-Muslim unity as well as a meeting between Quaid-e-Azam Mohammad Ali Jinnah of the Muslim League and Mahatma Gandhi. The hope was that these leaders could resolve their differences and collectively seek independence. Although the meeting took place, the leaders were unable to reach an agreement. After the failure of the Jinnah-Gandhi meeting, Mashraqi made another effort to keep India undivided, drafting a constitution for the nation. Although the constitution attempted to satisfy the needs of all communities in order to keep India united, it was not adopted.

In February 1947 the ongoing pressure from various sources, including the Khaksar Movement, prompted the British government to announce a transfer of power to the Indians. To ensure the actual transfer of power and in a final attempt to keep India undivided, Mashraqi called for the assembly of 300,000 Khaksars in Delhi.

However, due to government restrictions, only about 75,000 Khaksars were able to assemble. Since the desired number of Khaksars could not assemble and the division of India was now inevitable, Mashraqi disbanded the Khaksar Movement on July 4, 1947. Approximately one month later Pakistan and India emerged as two separate countries on the world map.

■ Introduction: Sports and Statecraft in the Early Twentieth Century

Throughout history, sports have always played a role in society. Whether they have brought people together or torn them apart, athletic contests have been instrumental as cultural, political, and social events. From the Ancient Olympics in Greece—which began in 776 BCE and served more as an avenue for the various city-states to congregate, celebrate military victories, forge treaties, and even settle political disputes—through the ceremonial ball games of the Aztecs, sports have proved to be more than mere entertainment.

In the first half of the twentieth century as the world suffered through various stages of colonialism, the horrors of two world wars, an economic depression, and various revolutions and civil wars, sports were often at the forefront of society's attentions. It would be through the utilization of sports and sporting events that different classes and races would be brought together, at least for a while. It would also sometimes be through sports that nations attempted to foster the assimilation of other groups.

In 1936 the world watched Nazi Germany take center stage as Berlin hosted the Summer Olympics. Adolf Hitler believed that these games were an opportunity to showcase what he thought was the superiority of the Aryan race. Coupled with the fact that he had already instituted anti-Semitic policies within Germany for various political, social, and racial reasons, even before the games began observers expected the Olympics to be filled with political intrigue and controversy. While Hitler proclaimed his athletes to be superior, he also ordered anti-Jewish signs and graffiti to be removed from public buildings and areas of Berlin in order to promote a false image to the world of an open and welcoming society. At the same time, Gypsies were rounded up in Berlin and other cities and secretly placed in "camps" out of the public's view.

Many Americans, especially the nation's Jewish community, wanted to boycott the games due to Germany's anti-Semitic policies, but the U.S. Olympic Committee believed that the na-

tion should participate. The committee was backed by many members of the African American community who understood that victories by black athletes at the games would not only undermine Hitler's claims of Aryan superiority but also help their standing at home. Among the biggest stories from the games was the performance of African American Jesse Owens (1913–1980), who won four gold medals. Owens publicly stated that he received better treatment from the Germans than from Americans back home and that Hitler afforded him more of an acknowledgment than U.S. president Franklin D. Roosevelt. In spite of this, Albert Speer, one of Hitler's top confidants, wrote after World War II that the Nazi leader was incensed at the fact that an African American had defeated numerous Aryan athletes. Overall, the successes of German athletes led Hitler to proclaim not only the superiority of his people but also his political system.

Two years later the world turned its attention to France, which hosted the 1938 World Cup. Held a little more than a year before the outbreak of World War II, this was another case where a sporting event was politicized. The team from Benito Mussolini's fascist Italy wore all-black uniforms in order to showcase their devotion to fascism, while Austria was forced to withdraw despite qualifying because the nation had been absorbed into Germany through the Anschluss earlier that year. Italy won the tournament, but not without controversy in the final match against Hungary. The Hungarian goalkeeper made a controversial comment after the match that led many to believe that he had allowed the Italians to score four goals in their 4–2 victory because the Italian team had supposedly received a threat from Mussolini to win or die. In reality the threat was actually misinterpreted by the Hungarian and was nothing more than common fascist rhetoric, which meant "play to your fullest ability." Others have claimed that Hungary's players did not give their best effort because of their concerns about their own gov-

ernment, which was fascist and two years later would join the Axis of Italy, Germany, and Japan during World War II.

Export of English Football

The spread of British customs and leisure activities accompanied the hegemony of British trade in the late nineteenth and early twentieth centuries in large part due to increased British involvement in the creation of transportation networks and nascent industrial sectors in regions such as Africa, Asia, and South America. As a significant increase in the number of British expatriates abroad accompanied the construction and management of British-owned railroads and textile factories, British managers, administrators, and entrepreneurs replicated customs and leisure activities from home, including English football.

As a consequence, by 1945 professional and amateur teams around the world played the sport of English football, also known as soccer. In several nations with strong economic or political connections with the United Kingdom, football quickly became the most popular sport. For example, in Latin America football developed into the national sport played by people from every socioeconomic level in countries such as Argentina, Brazil, and Uruguay. This was also true in Europe and to a lesser extent in parts of Africa and Asia. In response to this growth of popularity, officials representing football leagues from across the globe in 1904 formed the Fédération Internationale de Football Association (FIFA), which continues to be the main international body that controls football in the twenty-first century.

Within Europe, football initially spread from England to Denmark and Switzerland and then on to Belgium, France, Germany, the Netherlands, and Scandinavia. By the beginning of the

twentieth century, cities with large British enclaves such as Vienna, Budapest, and Prague witnessed the growth of the sport in their areas. The growth of football-oriented sports dailies, which quickly outstripped cycling journals in circulation, and the increased number of continental tours by British professional teams reflected the rise of public interest in football. Ever-expanding professional leagues formed within national boundaries, and these teams fed the public's appetite for the game.

British expatriates played football informally among themselves and formally with boarding school and club teams. As the sport became popular with indigenous populations, many British-owned factories and other businesses be-

THE EUROPEAN TOUR OF BOCA JUNIORS

In 1925 English football returned to Europe as *fútbol* in the form of a European Tour by the Argentine football club Boca Juniors. The team, composed of 17 players—12 from Boca and 5 on loan from other Argentine clubs—left Buenos Aires on February 4 for a five-month tour of Europe. Boca played 19 games in Spain, France, and Germany. The king of Spain, Alfonso XII, attended the match between Boca and Real Madrid, which the Argentine squad won. During their tour Boca Juniors won 15 games, tied 1, and lost only 3. The team arrived in Buenos Aires on July 12 to a large and enthusiastic public reception.

The Argentine press lauded Boca Juniors as ambassadors of the nation and of its emerging style of football: *el estilo criollo* (the creole style). News reports emphasized the distinctively Argentine cultural attributes of the players. For example, news articles reported that players had brought tango records along with them. In addition, reporters contrasted the artistic, improvisational, and passionate play of Boca Juniors with the mechanical and methodical style of their Old World competitors. In the end, the Boca victories over older, traditional football powers in Europe inspired pride in and respect for Argentine and Latin American football. Uruguay's defeat of Argentina in the finals of the 1928 Olympics and the first FIFA World Cup in 1930 reinforced the early dominance announced by the successful European Tour of Boca Juniors in 1925.

—Jonathan Hagood

gan to sponsor company teams. Argentina and Uruguay had the most highly developed football infrastructures in Latin America in the first part of the twentieth century. This fact evidenced the large British presence in the Río de la Plata region, which included a significant number of British-run boarding schools and British-founded athletic clubs. By contrast, company and neighborhood teams characterized the development of football in Brazil and Peru.

Football tournaments in the Olympic Games and FIFA's World Cup popularized international competition between national teams. Football premiered as an Olympic sport at the 1900 Olympics in Paris. Great Britain won the first three Olympic football tournaments as European teams dominated play. However, Uruguay's gold medal victories in the 1924 and 1928 Olympics signaled the rise of Latin America as a home of competitive football. Uruguay also won the first World Cup tournament in 1930. French football administrators, led by Jules Rimet, developed the international tournament, which was held three times before World War II put a 12-year stop to the competition. The World Cup resumed in 1950 and by the end of the twentieth century was the most popular international sporting event worldwide. According to FIFA, there were 41 FIFA-affiliated national football associations by the time of the first World Cup tournament, with that number reaching 73 when the games resumed after World War II.

During the 1930s Italy's domination of international football competition exemplified the use of sport by fascist regimes for political purposes. Italy won the World Cup as the host country in 1934 and again in Paris in 1938 and won the gold medal for football at the 1936 Olympics. In addition to using these victories to claim the superiority of fascism, Mussolini's regime also incorporated sports into its program of national regeneration by drawing on athletics to promote physical fitness and national pride in the average citizen. For example, although the Italian sport authorities' new game, *volata*—a mixture of soccer and handball—never became widely played, football remained the most popular sport organized within the fascist *dopolavoro* movement, or after-work program for the masses.

Introduction of American Baseball to Foreign Countries

By the early twentieth century the United States had joined the major European powers—Great Britain, Germany, and France—in a global competition for imperial influence. One of the tools that Americans used to build goodwill and to advertise the American lifestyle was the introduction of American baseball overseas.

In 1867 American teacher Horace Wilson introduced the game of baseball (*besuboro*) at Kaisei Gakko (now Tokyo University). Hiroshi Hiraoka, an engineer who had studied in Boston and subsequently became a Red Sox fan, assembled the first Japanese baseball team, in 1878, from members of the Shimbashi Athletic Club in Tokyo. Keio University had a team in 1885, and Waseda University, Keio's great rival, formed a team in 1901. Together with Meiji University, Keio and Waseda formed an intercollegiate league in 1914. When Nels Norgren of the University of Chicago led a collegiate team to Japan in 1922, he reported in amazement that baseball was more the national sport of Japan than it was in the United States.

Two years after a memorable 1934 goodwill tour by an American team that included Babe Ruth, which took place during an increasingly difficult period in U.S.-Japanese relations, a professional league was launched in Japan. In the summer of 1941 the militarists who controlled the Japanese government disbanded the league, and baseball fell out of favor for a time. After World War II baseball in Japan was back in vogue although with a new name, *yakyuu*. In 1950 the Japanese established a two-league system akin

to the American system, and every autumn the champions of the Central League and the Pacific League compete in the Japan Series.

Baseball was introduced to Cuba by Nemesio Guilló in 1864 after his return from studies in the United States. The first historically attested game took place between Habana Base Ball Club and a team from Matanzas, according to a report published in *El Artista* on December 31, 1874. Cuban teams were numerous enough by 1878 for Havana's Emilio Sabourín to organize the Liga de Béisbol Profesional Cubana (Cuban Professional Baseball League), whose first and second annual tournaments were won by El Club de Habana. An 1887 tour in Cuba by the Philadelphia Athletics also helped to popularize the game on the Caribbean island.

After the 1898–1902 Spanish-American War, when U.S. troops gained control of the island nation, Cuban baseball took off. In 1922 an entire team, the Cuban Stars, became a part of the eight-team Negro National League in the United States. A number of yanquis who failed to make major league rosters in the United States tried their luck on the island. The money and the climate were not the only attractions. The Cubans' more relaxed attitudes about racial differences made it possible for major leaguers, all of whom were white, to compete in Cuba against Josh Gibson and other stars of the Negro National League. For the Negro League players, Cuba served as an escape from repressive racism.

Meanwhile, in Mexico, the Yankee employees of the Mexican National and the Mexican Central railroads organized company teams in the summer of 1882 to play scrimmage games. The first Mexican teams were formed no later than 1886, and by 1895 Mexican players in the capital were skilled enough to win the city's championship against the American teams. In 1904 the Mexican teams established two leagues, and in 1907 the Mexican baseball scene received an unprecedented boost from the Chicago White Sox, who held their spring training in Mexico.

By 1924 Mexico City had at least 56 teams, and a visit to the capital by Byron Bancroft Johnson, the founder of the American League, left him so enthusiastic that he decided to encourage the development of a new professional

BASEBALL AT THE OLYMPICS

Baseball has a very strange history at the Olympics. The first unofficial game occurred in exhibition in the 1904 Olympics in St. Louis. Exhibition games also occurred in 1912, 1936, 1952, 1956, and 1964. Baseball became a tournament event in 1988, but it was not officially granted medal status until the Barcelona Olympics in 1992. Players were required to be amateurs. As of the 2008 games, Cuba has won three gold medals and two silver medals, the United States has won one gold and two bronze medals, and Japan has won one silver and two bronze medals. Meanwhile, South Korea earned its first gold medal in the sport at the 2008 Olympics. Interestingly, prior to the 2008 Olympics, the International Olympic Committee decided that baseball would not be part of the 2012 London Olympics, citing the absence of major league participation and limited international participation, among other factors. However, the sport may be reconsidered for inclusion in the 2016 Olympics.

league, which began operation in 1925. By the 1940s the level of play and of salaries in the Liga Mexicana (Mexican League) were both high enough to cause a crisis in major league baseball in the United States. A Vera Cruz millionaire, Jorge Pasquel, became president of the Liga Mexicana and offered players from the United States two or three times what they earned north of the Rio Grande to play in Mexico. Major league baseball's commissioner, Albert "Happy" Chandler, blacklisted the jumpers but was unable to dam the southward flow of players or entice the defectors to return.

Meanwhile, the Dominican Republic had become the center of gravity for Caribbean *béisbol*. The first Dominican clubs were formed in 1891 by Ignacio and Ubaldo Alomá, ironworkers from Cuba. When Dr. Samuel Mendoza y Ponce de León took the game to the interior of the island in 1893, he adopted the nicknames that the fans had given to the two Cuban teams because of their blue and red uniforms: the Azules (the Blues) and the Rojos (the Reds). In 1914 Dominicans rejoiced as Enrique Hernández of El Club Nuevo pitched a no-hitter against a team of Americans from the U.S. Navy cruiser *Washington*.

After World War II came the development of the Dominican professional league in 1951, but the flow of baseball players would reverse direction toward El Norte. The racial integration of American baseball, which had begun in 1947, opened doors for Dominicans of African ancestry. However, for Cuban players, white and black, the doors to major league baseball slammed shut in 1960 when contacts between the United States and communist Cuba were broken. After 1960 the Dominican Republic became North American baseball's chief source of Caribbean talent.

Some historians have argued that American baseball became a form of cultural imperialism, as baseball diamonds were laid out in regions stretching from East Asia to Australia and the Caribbean beginning in the mid-nineteenth century. In an increasingly interconnected world, as more Americans traveled abroad—whether for business, to be stationed at a far-flung military outpost, or as athletes on goodwill tours—they took their culture and their love of baseball to distant lands, and while they imparted the rules of the game with native peoples, the spread of American culture was inseparable.

The Olympic Movement

The Olympic Games of today bear little resemblance to the first modern Olympics, held in Athens in 1896. The early games struggled to define their ideals, survive both world wars, and outpace other national and regional sporting events. From the beginning, the Olympics have been in-

tertwined with international politics and diplomacy. This intrusion of politics into the Games has at times interfered with their original purpose: to offer a forum for peaceful athletic competition among all nations.

In spite of its message of global unity through sport, it was not until after World War II that the Olympic Games became a truly global event. All of the Olympics from its revival in 1896 to the 1952 Games in Helsinki were held in either Europe or the United States. Indeed, only one city from outside these regions even made a bid, when the Egyptian city of Alexandria made an unsuccessful application for the 1916 Games.

The man whose vision fueled the revival of the Olympic Games was the French educator Pierre Frédy, Baron de Coubertin. Coubertin set about to improve the health and vigor of French youths after the French defeat in the Franco-Prussian War of 1870–1871. Based on the examples of ancient Greece and modern England, Coubertin developed his own model for a complete education, which incorporated training in academics, morals and ethics, and athletics. From this vision grew the Olympic ideal, which was understandably rooted in upper-class Western ways. The men who met in Sorbon, France, in 1894 to establish the new Olympics looked to upper-class English prep students as their model of athletic achievement and took much from their own athletic experiences in sports such as tennis, rowing, cricket, and yachting, almost exclusively the preserve of the wealthy. As such, the amateur ideal essentially excluded working-class athletes.

The early Olympics were small, and the range of participating nations was limited. Only 13 nations and 12 reporters attended the first Olympics, held in Athens in 1896. Virtually everyone in attendance and all of the participants were either from Europe or the United States. The early Olympics endured considerable growing pains. The 1900 Paris Games were poorly scheduled, poorly publicized, and poorly run. They coincided with Bastille Day, the French national holiday, and few spectators attended. The St. Louis Games of 1904 were even worse, as few nations were able to send a team to such a distant city. The Olympics were also overshadowed by the St. Louis World's Fair, which attracted greater attention and larger crowds.

> JESSE OWENS

American Jesse Owens became the star of the 1936 Olympics, winning four gold medals in track and field events, setting world records in the broad jump and 200-meter race, and tying the record for the 100-meter run. After watching him win his first event, Adolf Hitler purportedly stalked from the stadium in a state of fury. Whether or not that tale is true, the generally gentle, amiable Owens completely destroyed Hitler's desire to prove Aryan racial superiority through the competition. On the other hand, Owens enchanted the German population. Schoolboys idolized him and thronged in areas where they hoped to catch a glimpse of him. Many adults were just as enthusiastic; the German media described him as the *Wunderathle*, or "god of the stadium." One would like to report that racism died that day, but of course it did not do so in Germany or in Owens's homeland, the United States. During his latter years Owens was criticized by some in the civil rights movement for his moderation and lack of acrimony as he worked to help reduce racial tensions and animosity in the United States.

—Carolyn Neel

African American athlete Jesse Owens at the start of his record-breaking 200-meter race at the 1936 Nazi-hosted Olympic Games in Berlin. (Library of Congress)

The disappointments of these early Games led Coubertin to experiment with the idea of a permanent site. In 1906 the Olympics returned to Athens for what would be the first, and last, in an anticipated series of Olympics held at their original site. While not part of the traditional four-year Olympiad, this contest marked the beginnings of a transition to the modern Games, as more nations attended than ever before (20), and those that did submitted their athletes to a more rigorous entrance process than in earlier Games. This transition continued in London in 1908, when numerous controversies inspired the installation of international neutral teams of officials since the hometown British judges made many questionable rulings in favor of British athletes.

By 1912 the Games were well established and had begun to take on the modern implications of nationalism. The final Olympics before the interruption of World War I were hosted for the first

time in a Nordic city, Stockholm. The Swedes far outdid any of their predecessors in preparation, construction, and attendance at the Games. With such innovations as electric clocks, photo-finish equipment, and brand new athletic and housing facilities, Stockholm previewed many of the characteristics of more recent Olympics. Controversies over which events should be included in the program indicate the increasingly international and politicized nature of the Games.

The Olympics enjoyed their period of greatest growth and innovation during the inter-war years, as the host cities fell into a pattern of one-upmanship that made each festival more grandiose than the last. The 1920 Olympics were hosted in Antwerp, Belgium. A poorer choice could hardly be imagined, as Belgium was perhaps the most war-ravaged of all European nations, and the destitute populace could not adequately support the Olympics. But the

expansion of the Games resumed four years later when the Olympics returned to Paris. They were a celebration of excess, a not-so-subtle symbol to the world that the war was over and all was well. The splendor and decoration, the pomp and circumstance of the modern Games began to appear, as national flags and national anthems became ubiquitous. The excitement surrounding the Paris Games was almost matched by the Amsterdam Games of 1928. Returning to a smaller country lent an international flair to the 1928 Games, as more nations won medals than ever before, and the traditionally dominant teams from the United States, Britain, and France all saw their medal totals drop. Also in 1928 women competed in track and field for the first time, although the fact that several of them fainted during the 800-meter run led the slate of women's events to be limited in future Olympics.

The interwar blossoming of the Olympics is best exemplified by the 1932 Los Angeles and 1936 Berlin Games. In 1932 the United States placed a great deal of significance on the Olympics to ease the hardship of the growing Great Depression and to show the world that Americans could put on a great show in spite of the hard times. The Los Angeles Games set a new precedent for expense, extravagance, and construction of new facilities.

Four years later the Germans took each innovation from the Los Angeles Games and made

it bigger and more elaborate. Adolf Hitler and the Nazis used the 1936 Olympics to publicize their regime and its organizational abilities. These Olympics were also infused with political tensions, and the openly racist policies of the Nazi regime led to many protests, including an international boycott led by Jewish and worker communities. These Games are also noteworthy for the resounding success of black American athletes, particularly of track star Jesse Owens whose victories shattered the myth of Aryan supremacy. The Berlin Games, the last held before 1948, set a standard for spectacle as well as for politicization that would remain unmatched perhaps until 1968 when protests and boycotts again took center stage at the Olympics.

Exports of Sports to Colonial Possessions

The globalization of sports is one of the few positive outcomes of colonialism. Many sports grew in popularity throughout the world during the first half of the twentieth century, so much so that global tournaments are now held. Some of the most popular team sports in the world such as football (soccer), cricket, and rugby grew in popularity as colonial exports. Other individual sports also gained prominence. Sports typically associated with the higher socioeconomic classes, such as polo and equestrian, also became popular in colonial territories.

Colonialism was for a long time a significant part of global relations, basically occurring when one state asserted sovereignty over a foreign territory by settling it and/or exploiting the natural resources and the labor force of said territory. Brit-

➤ FIFA AND THE WORLD CUP

The Fédération Internationale de Football Association (FIFA) was founded in Paris in 1904 to serve as the international body regulating international soccer matches and harmonizing the rules of the game. FIFA started a global tournament in 1930 known as the World Cup in which countries from all over the world could qualify and compete for the title of being the best team on the planet. Under the direction of FIFA, 208 national associations currently compete in the World Cup tournament, making it a truly global event. National teams qualify through their various continental zones until 32 teams come together in a final tournament format.

—Glen M. E. Duerr

ain, France, Spain, Portugal, the Netherlands, Germany, Denmark, Sweden, Belgium, Italy, Turkey, Russia, and the United States were all involved in colonialism, albeit to different extents and in different contexts. Part of the colonial legacy was the sharing of institutions, governance, and economic rules. However, this also extended to cultural elements in society, including leisure and recreation. Sport is a major part of life in much of the world. It occupies much time, discussion, and thought. Yet in order for various sports to become recognizable throughout the world, they required exportation so that their rules could become harmonized. This is where colonialism played a significant part in the export of sports.

Sport became much more global in the late nineteenth and twentieth centuries such that the same sports were being played by metropolitan states and their colonial possessions all over the world. Many global team sports were invented in England and the United States. The most popular, soccer, grew out of England and spread throughout the British Isles in the mid-nineteenth century and then onto the European continent in the late nineteenth and early twentieth centuries. In this way, it gained a foothold in Europe and was exported to the various European colonial possessions. In fact, significant numbers of the first teams were founded by British businessmen or missionaries throughout the world.

Another popular team sport, cricket, spread in a much different manner. Not popular in Europe, it spread throughout parts of the British commonwealth. There are various different lengths of a cricket match, but the most prestigious is test match cricket, which lasts up to five days. England and Australia originally began playing test matches in 1876. Since then, other countries have also gained test match status including South Africa (1889), West Indies (1928), New Zealand (1929), India (1932), Pakistan (1952), Sri Lanka (1982), Zimbabwe (1992), and Bangladesh (2000), all of which are in the British commonwealth.

England was not the only place where sports were invented and then exported. Other team sports like basketball and baseball, which were popularized in North America, also spread throughout the world. Baseball spread throughout parts of the Caribbean such as Cuba and

➤ SOCCER AT THE 1936 SUMMER OLYMPICS

Among the various controversies at the 1936 Olympics, many incidents during the soccer tournament proved particularly polemic. Italy advanced to the finals but not until after a controversial 1–0 victory over the United States. After a fight that left two Americans injured, the referee ejected an Italian player from the match, but he refused to leave. Several Italian players suddenly surrounded the referee and verbally threatened him. The Italian player was allowed to stay in the match. In a quarterfinal match, Peruvian fans rushed onto the field and attacked several Austrian players. In the ensuing chaos, Peru won the match. Austria protested, and after a meeting with Hitler the Olympic Committee ruled that the match was to be rescheduled. Peru refused to replay the match and left Germany. Austria was awarded a spot in the semifinals. Italy eventually won the Gold Medal, and Mussolini claimed this as a great victory for fascism.

—Seth A. Weitz

the Dominican Republic, which were under direct U.S. colonial control, and through parts of Latin America such as Venezuela and Nicaragua, where U.S. geopolitical influence was significant. Despite the many negative aspects of colonialism, sport is an area where states can come together and participate in goodwill events. The long-term impact of sports in colonial possessions has been quite a positive outcome of colonialism. It has allowed participants from across the world to share what has often been referred to as a “common language.”

■ Introduction: Ethnic Conflict and Genocide

From 1900 to 1945, growing ethnic nationalism and the stresses of economic pressures and warfare caused the number and scope of ethnic conflicts and genocidal reactions to grow exponentially. The Turkish assault on Armenians within the Ottoman empire in 1915 led to the death of an estimated 1.5 million Armenians. Hitler cited this action as a precedent as Germany began its “final solution” against the European Jews, resulting in the death of approximately 6 million Jews between 1939 and 1945. These incidences of state violence directed against undesired ethnic groups were often perpetrated in a context of total war. During the Holocaust the attempt to eliminate all Jews and Gypsies was undertaken by the German state and military authorities with civilian cooperation in Nazi-occupied Europe. It differed from the prior pogroms of tsarist Russia, which while sponsored by the regime were carried out by Russian villagers who were bent on violence against local Jewish communities and unleashed violence on a relatively smaller scale. Colonial genocides were also undertaken by colonial authorities, most notoriously the German genocide of the Herero people in German South-West Africa from 1904 to 1907, that were shock-and-awe tactics perpetrated by imperial powers against resistant subject populations in an effort to eliminate resistance against their authority. In contrast, political famines were often caused by a lack of action by the state that subsequently led to the depletion of an ethnic group, such as in the Ukrainian famine of 1938. While these famines were similar in scale to acts of genocide, they were qualitatively different given that there was no actual violence but rather deliberate inaction that would thus lead to catastrophic mass death.

—Abraham O. Mendoza

Ideology of Genocide

Almost always, an important part of the process that leads to genocide is an ideology that the perpetrators create or adopt. This ideology varies in form or content but usually has certain struc-

tures in common with other ideologies that support genocide, and they all serve certain common functions for the group and its members.

An ideology is a conception of social arrangements in a society or in the world that for the creators of the ideology are the desirable, ideal forms of life. There are *nationalist ideologies*, which focus on the wealth, power, influence and frequently also the purity of a group or nation; and “*better world*” *ideologies*, like communism, which offer a vision of ideal social arrangements for all humanity.

Many ideologies are destructive, potentially genocidal, in that they identify enemies who supposedly stand in the way of the ideology’s fulfillment. These enemies must be “dealt with” if the ideology is to be fulfilled. Sometimes the intention to kill them is present from the start. More often, there is no intention or fully formed intention to kill them, but discrimination and limited violence against the opponents, nonbelievers and outsiders lead to changes in perpetrators and to an evolution of increasing violence that ends in genocide.

Genocidal ideologies can have both nationalist and better-world elements. For example, the Nazi ideology included the concept of “*lebensraum*” or living space, the right of Germans to more territory, clearly nationalist in nature. It also included the concept of the purity of race. While its focus was the protection of Germans from Jews, Gypsies, and others, even genetically inferior Germans, it implied that by eliminating the contamination of higher races by lower ones all the higher races would be improved. The “autogenocide” in Cambodia was based on a vision of total social equality derived in part from communism, but had nationalistic building blocks and elements. The genocide of the Armenians in Turkey was shaped by a “pan-Turkish,” nationalistic ideology. The violence in Bosnia was based on a combination of fear, hate and ambition that manifested itself in a primarily nationalistic form.

Why do people turn to such destructive ideologies? They often do so in response to difficult social conditions and the frustration of basic human needs, fear and confusion. Having a positive

vision of the future provides a comprehension of reality and hope in place of the chaos and confusion of the present. It helps people unite, at a time they feel alone and isolated. It provides them with purpose and meaning, at a time they feel helpless and not in control of their lives. People do need visions of a hopeful future in such difficult times. Unfortunately, the culture, past history and the conditions of life generate forces for the creation of visions that identify enemies. Scapegoating some group, identifying it as responsible for life problems, provides an explanation for the difficult conditions of life, and makes people feel better about themselves. Pointing to enemies also brings people together, helps them unite. The group's culture often includes a history of devaluation of the group that becomes the scapegoat and ideological enemy (the Jews, the Armenians), or a historical rift (between people in the cities and in the countryside in Cambodia). At times the difficult conditions themselves arise from conflict and enmity with another group, or there is a history of mutual antagonism between the two groups (like the Hutus and Tutsis in Rwanda and Burundi). Long-standing traditions of dehumanization and antagonism can be greatly and speedily intensified and catapulted into frenzied extremes relatively easily and in amazingly short periods of time by propaganda campaigns, for example, Hitler's repeated denunciations of the Jews in contexts of majestic public events accompanied by stirring pageantry and martial spirit. There was an extensive state-run radio campaign against the Tutsi preceding the Rwanda genocide in 1994.

As the dehumanization effect escalates, another mechanism of attribution of evil intention and demonic powers to the intended victim people also comes into stronger play. In the end, the implicit or explicit message becomes that the other people must be killed first in order to save one's own people from destruction. The combination of dehumanization—they are not human beings like us and are outside our moral universe of obligation to protect human life—and attribution of dangerous demonic intent and strength provides a powerful basis for an ideology of genocide: they deserve to be and must be eliminated.

To make genocide less likely, groups and their leaders have to choose the psychologically

more difficult path of forging constructive ideologies in difficult times, positive visions that unite all groups to work together for practical solutions to life problems.

Armenian Genocide

The Armenian Genocide of 1915–1922, triggered during the hostilities of World War I, was the first major genocide of the twentieth century, resulting in the deaths of an estimated range of 5,000 to 1.5 million Armenians and the subsequent deportation of the remaining 2 million Armenians living within the Ottoman empire. Some historians suggest that the failure of the Western Allies to punish the Turkish perpetrators of the genocide set a precedent by which future genocides later in the century, including the Holocaust during World War II, were made possible. The major factors that contributed to the Armenian Genocide were the xenophobic nationalism espoused by the Young Turk Movement seeking to create a national Turkish state, wartime fears of foreign invasion assisted by alleged Armenian traitors, official and unofficial Islamic religious intolerance directed specifically at Christian Armenians (chastised as infidels, or *gavurs*), and decades of resentment directed at the economic prosperity of the Westernized Armenian middle classes of the towns and cities.

➤ GLOBAL REACTIONS TO THE FIRST MODERN GENOCIDE

The sheer number of casualties from World War I, numbering in the tens of millions, astounded the international reading public upon learning about the extreme nature of total war and the new technologies that made such destruction possible. Similarly, the Armenian Genocide struck the consciousness of the reading public as something unique in that it had occurred in the context of the greatest war up to that time, but concern proved to be short-lived. Upon initial revelations coming from inside correspondents and witnesses, the genocide was constantly discussed in U.S., British, and French newspapers, among other major world news presses of the time. However, reaction to the Armenian massacres was mixed, ranging from extreme revulsion and condemnation to indifference among both the European and North American public. In the United States the

Armenian Genocide generated considerable attention, managing to mobilize religious organizations to raise money and aid Armenians in the Ottoman empire. Nonetheless, many places throughout the world were too distracted by news closer to home and the devastation and destruction brought on them by World War I to dwell too much on the annihilation of Armenians at the hands of the Turks. Eventually the genocide failed to attain much long-term attention after the end of the war and during the interwar period. A mere two decades later, before embarking on his wars of aggression that would culminate in the destruction of European Jewry, Adolf Hitler would reportedly quip “Who now remembers the Armenians?” in light of the lack of attention and remembrance that the Armenian Genocide attained.

—*Abraham O. Mendoza*

The Armenian Genocide was the eventual culmination of decades of persecution of Armenian communities in the Ottoman empire at the hands of government officials and Muslim civilians. Armenians were harassed for their economic success (albeit only achieved by a minority) and their Christian religion. The history of their persecution includes the Armenian massacres of 1894–1896 in Sasun and the Moush Plain, leading to an estimated 100,000 to 200,000 deaths, and in Adana in 1909 with approximately 15,000 to 30,000 deaths. These were all areas of dense Armenian settlement in northern Turkey on the border with Russia. In the late eighteenth century, the Ottoman empire had been experiencing a long period of decline, having lost territory in Europe and North Africa to seceding provinces and the European Great Powers. The Ottoman empire’s Balkan Wars of 1912–1913 with its former colonies of Greece, Bulgaria, and Serbia contributed to a substantial loss of territory in European Turkey. These Christian nations were seen as assisting in the breakdown of the Ottoman empire, and internal Christian minorities were suspected of also seeking independence, particularly Armenians who had sought such arrangements in the past. In response, the Young Turk government, otherwise known as the Committee for Union and

Progress (CUP), led by Jemal Pasha, Enver Pasha, and Talat Pasha, established a nationalist Turkish state and proceeded to abandon the former policies of multiculturalism of the Ottoman empire and embrace a militant nationalism. The leaders of the CUP government were xenophobic nationalists who suggested that the multinational character of the Ottoman empire was responsible for its long-term decline and thus advocated creating an ethnically homogenous Turkish state, embracing all Muslim Turks in Anatolia and in the adjacent provinces in Russia populated by Turkish-speaking peoples (Turan).

In the summer of 1914, as World War I commenced, the CUP decided to ally itself with imperial Germany and the Central Powers against France and the traditional Turkish enemy, Russia. In the event of a major European war, the CUP sought the creation of a Turkish homeland, Turan, that would unite the Turkish Ottomans with the Turkic-speaking people of southern Russia and Central Asia. Such plans obviously necessitated eliminating the Armenian populations who traversed these regions. The CUP wished to utilize the pretext of World War I to annihilate the Armenians without attracting foreign involvement, so they accused Armenians of collaborating with the Russians in their plan to invade the Ottoman empire.

In response to Armenian intellectuals' requests for Ottoman neutrality in the war, on April 24, 1915, Turkish officials apprehended Armenian social and political leaders, deporting them to Anatolia and murdering them en masse. On May 27, 1915, the "Regulation for the Settlement of Armenians Relocated to Other Places because of War Conditions and Emergency Political Requirements," commonly known as the Tehcir Law, was passed by the Ottoman Parliament under the aegis of the CUP. Utilizing the Tehcir Law as a pretext, the CUP quickly decided to relocate the Armenians living on the eastern borders of Anatolia, claiming that they would be instrumental in assisting the Russian forces in an invasion. The Special Organization was established by the Ministry of War to recruit, organize, and deploy thousands of convicted criminals for the explicit purpose of exterminating the Armenian population. These death squads, known as *chetes*, operated with impunity and were estimated to be between 30,000 and 34,000 in total number. The *chetes* were also assisted by the Turkish military police and gendarmes. Turkish officials seized Armenian men by drafting them into the military, either murdering them (by shooting them point-blank) or assigning them to labor battalions and working them to death. The remaining women, children, and the elderly were evicted from their *vilayets* (provinces) and forced into relocation camps in the arid deserts of Syria and Mesopotamia. The CUP also relied on the use of their railways to deport the Armenians by loading them onto freight cars and then releasing them at their destination, only to be subsequently raped and murdered by the *chetes*.

For months, many Armenians were marched in the thousands over treacherous mountains and arid deserts, starving in droves due to the lack of food and water. Along the way, many were tortured, abused, raped, or murdered by *chetes* and Kurdish mercenaries assigned to implement such forced relocation by Turkish bureaucrats. Many Armenian orphans were seized from their soon-to-be murdered parents and given to Turkish or Muslim families. Older children were coerced to convert to Islam. Many if not most of those Armenians who survived these forced relocations by managing to escape died in the desert from exposure. A further estimated 20,000 Armenians were slaughtered upon the Ottoman military advances

into Russian Armenia late in the war, suggesting that the CUP was intent on eliminating not just Armenians within the Ottoman empire but also those in Russia and Central Asia in their effort to create a Greater Turkish state. Toward the end of the war in 1918 and well into 1922, the newly created Turkish state under the CUP continued to persecute the remnant of the Armenians, albeit on a smaller scale, in their efforts to create a more homogenous ethnic state. Armenians who managed to survive the genocide left the newly created republic of Turkey forever, choosing to settle in the United States, Great Britain, France, Germany, and Australia, among other places around the world.

The use of the term "genocide" in this case remains controversial, as the Turkish government and some Turkish intellectuals dispute that genocide was committed against Armenians.

Persecution and Genocide of Jews in Europe

The early twentieth century was a turning point in Jewish history. Jews at this time faced physical annihilation and persecution for their perceived otherness from mainstream European identities. Many Jews fled anti-Jewish sentiment and the increasing homogenization of ethnic identities that accompanied European-style nationalism, leading to growing Jewish populations throughout the world and the development of Zionism, or Jewish nationalism. Yet Jewish persecution was not a twentieth-century invention. Small Jewish communities existed throughout the world in America, Australia, Argentina, and China prior to 1900, and most of these were settled due to persecution in Europe.

➤ JEDWABNE MASSACRE (1941)

Following the German invasion of Poland in 1939, Soviet troops entered eastern Poland to occupy their half of the country, as was agreed in the Nazi-Soviet Pact (Rippentrop-Molotov Pact). For two years anti-Semitic Polish locals blamed the Soviet occupation on the Jews. With the German attack against the Soviet Union in 1941, eastern Poland was invaded by German occupation forces. However, before the German Army even reached the town of Jedwabne, local Polish citizens took it upon themselves to round up local Jews and shoot them en masse, among other acts of violence (burnings, beatings, and other attacks). An estimated 600 to 1,600 Jewish deaths were attributed to this massacre, prompted not by official Nazi directives but by local Polish initiative. For years after the war, most killings associated with the Holocaust were attributed to the Germans by many people in Poland. However, this episode and other countless acts across Europe illustrate that the Holocaust occurred at various levels and often involved local initiative.

—*Abraham O. Mendoza*

One reaction to these pogroms was a rise in nationalist thinking. Although Zionism existed prior to 1900, the second wave of pogroms brought a renewed sense of urgency to many in the organization. Zionists sought to create an autonomous Jewish homeland. In 1901 the Zionist Organization, now the World Zionist Organization, was formed along with the Jewish Agency to facilitate and administer the acquisition of land in Palestine. By 1914, there were approximately 60,000 Jews in a total population of 800,000 in Palestine and many settled farming communities on Jewish Agency land, such as Tel Aviv. The Jewish population steadily increased after the 1917 Balfour Declaration whereby the British government accepted and nominally supported the Jewish claim to Palestine. The immigrants clashed with the local population on a number of occasions, forcing the British to issue White Papers, or governmental memorandum, in 1929 and 1939 to curb the influx of Jews to Palestine. With the advent of World War II, the British lost interest in Palestine as the fighting in Europe increased.

The rise of the German Nazis and their genocidal policies represented a unique situation in history in which a government attempted to exterminate those whom they considered undesirables such as Jews, Gypsies, Catholics, mentally handicapped persons, homosexuals, and other resisters. The genocide began in earnest with Kristallnacht (1938) in which individual soldiers killed so-called undesirable civilians. The killing of unarmed civilians led to low morale among many German soldiers, and the Nazi government eventually enacted the Final Solution whereby groups of undesirables were killed en masse so as not to lower the morale of the German soldiers with individual killings. These large-scale killings initially occurred in warehouses and basements but eventually moved into more formal locations, called extermination camps.

Before being transported to the camps, many Jews were forcibly moved into ghettos, such as the Warsaw Ghetto in Poland around 1940. Here, Jews lived in squalor and poverty, isolated from the outside world. The ghettos provided collection areas for those being prepared to enter the labor or concentration camps. In forced labor camps, prisoners were forced to build the facilities where they and others would eventually be killed. Some labor camps became

Throughout the 1800s, the Russian empire had begun a repressive crackdown on Jews, which manifested itself in the form of pogroms, or anti-Jewish riots, and forced assimilation into and identification with Russian cultures. Often, these attacks accompanied events blamed on Jews, such as the 1881 pogroms when Jews were rumored to have killed the tsar. Another wave of pogroms hit Russia in 1903 and 1905. In 1903, pogroms broke out in Bessarabia (modern-day Moldova) after a young Christian boy was found dead and a local newspaper blamed the Jews. Two years later, another pogrom occurred after antitsar riots got out of hand. Some authors believe that the imperial secret police or local police sanctioned this second wave of pogroms, but many agree that the tsar was not included in the planning. Pogroms continued to occur throughout the early 1900s and often accompanied times of general unrest, such as those that occurred during the Russian Revolution of 1917 and the Polish-Bolshevik War of 1918. It is important to note that with all of these attacks on Jewish communities, no more than 500 Jews were killed in total.

extermination camps; the most notorious were Auschwitz-Birkenau and Treblinka. More than 50 percent of the Jews in Ukraine, Hungary, Holland, and Czechoslovakia and more than 90 percent of all Jews of Poland and Germany were killed during the Holocaust, with no fewer than 5 million European Jews being killed in total.

This time in history is commonly referred to as genocide today, but the concept of genocide did not exist prior to 1944. By 1948, it was sufficiently popular to be adopted into the language of international law with the publication of the United Nations Convention on the Prevention and Punishment of the Crime of Genocide. Each of the convention stipulations comes directly from the European experience with the Holocaust and the specific targeting of groups for annihilation. In recent years, this term has been expanded to also include the experiences of Armenians and Rwandans.

The persecution of Jews did not develop in the twentieth century. What was a twentieth-century innovation was the idea that entire groups could be systematically eliminated at the whim of a government. While the pogroms of the early twentieth century focused on attacking Jews, there was not yet an idea that as a group they could be wiped off the earth. By the 1940s, the wholesale elimination of Jews from Europe was under way, prompting an exodus when possible or large-scale death. When viewed with the major trends of violence and discrimination that were embodied by the pogroms and the Holocaust, it is undeniable that European Jewish history in this period is nothing less than a struggle between assimilation and the retention of culture.

Political Famines

The instances of famine in the first half of the twentieth century affected greater numbers of peoples on a vaster scale than in previous centuries. World War I and World War II and their dire consequences on both militants and civilians led to mass starvations in both Europe and Asia. During both wars, naval blockades, disrupted food supply networks, major shortages, military occupations, and widespread hoarding led to millions of deaths through starvation and diseases associated with malnutrition. Under the drive toward agricultural collectivization in the Soviet Union in the 1930s and the Nazi policy toward Jews and others who were deemed racial inferiors under the Third Reich in the 1940s, millions suffered official state-sanctioned famines in central and eastern Europe. Large-scale famines in China, India (Bengal), and Vietnam associated with major droughts, bad harvests, and warfare also killed tens of millions between 1900 and 1945.

World War I triggered multiple instances of large-scale famines due to the restrictions imposed by occupation forces or to the economic mobilization for total war. The German military occupation of Belgium eventually resulted in famine due to the strict regulations that military authorities held over provisioning the civilian population, whom they regarded as hostile. Similarly, conditions inside Germany itself due to the British blockade and state prioritizing of food for frontline soldiers led to an onset of malnutrition and starvation among the German civilian population late in the war. Food shortages in Russia during World War I and the subsequent Russian Civil War led to two major famines that resulted in millions of deaths primarily due to requisitioning by central authorities and the disruption of food distribution networks. The needs of soldiers and combatants were placed at

BRITISH BLOCKADE OF GERMANY, 1918–1919

In the latter years of World War I (1914–1918), the British Royal Navy continued its economic blockade of Germany. Landlocked and cut off from food sources from both the Atlantic and the Eurasian landmass by enemy forces, Germany was increasingly forced to rely on its own food supplies in order to continue the war. What food was available was prioritized for German troops on the front, with civilians constrained by a rationing system that supplied them with nothing but meager near-starvation rations. As the war drew to a close with the armistice of November 11, 1918, the blockade ended temporarily. However, in order to force concessions from the Germans at the Paris Peace Conference, the British continued the blockade of Germany well into 1919. Already weakened by disease and malnutrition and plagued with a broken-down supply system, nearly half a million Germans died of starvation as a result of this British naval blockade. The British blockade continued for eight months after the cessation of hostilities, further inflaming the resentment of those who would later protest against the injustices heaped on a defeated Germany, such as the leaders of the postwar National Socialist movement.

—*Abraham O. Mendoza*

a higher premium than that of civilians, resulting in lower rations and the potential for shortages that would then trigger malnutrition and instances of starvation among the less fortunate.

The interwar period was characterized by the incidence of both political and natural famines, particularly in Asia. Josef Stalin's drive toward collectivization in the 1930s resulted in multiple famines throughout the Soviet Union, especially in the Ukraine and Kazakhstan. Widespread food requisitions and flawed government policy decisions allowed the situation to spiral out of control, resulting in the estimated deaths of 10 million people (up to 20 million by some accounts). China suffered multiple famines due to constant warfare among major warlords that disrupted food supply networks but also due to a series of bad harvests and droughts. In 1928 and 1929 a famine in northern China claimed as many as 3 million lives, while another major famine in 1936 claimed approximately 5 million lives.

World War II had various instances of famines, deliberate in the case of the Holocaust and also due to the hardships created by the vastness of the conflict in places such as the Netherlands, Greece, and Poland. The German Final Solution policies deliberately cut the daily calorie intake of Jewish prisoners to ensure their starvation in the labor and concentration camps. Furthermore, hordes of prison laborers in Germany brought in from Nazi-occupied Europe had to suffer the deprivation of food, while most of the available stock was reserved for Germans. Occupied countries such as the Netherlands (estimated 20,000 deaths) and Greece (approximately 300,000 deaths) suffered tremendously under Axis authorities, which requisitioned and limited their food supplies to a bare minimum, resulting in tens of thousands of deaths.

The dislocations caused at the end of World War II also resulted in massive famines in places such as Central Europe and Vietnam. As Allied forces flocked to bring supplies to the hungry, they found that millions were prone to starvation due to the impositions placed on them by occupation forces during most of the war. For some, such as many displaced persons (DPs), it was already too late, as they had already become weakened and prone to other diseases such as typhus. Near the war's end, between 400,000 and 2 million civilians are believed to have died in Vietnam as a result of the Japanese occupation of that country.

Pogroms in Russia

At the turn of the twentieth century Jews comprised about four percent of Imperial Russia's population. Nearly all Russian Jews were required to live in the 10 Polish provinces or the 15 Lithuanian, Belarusian, Ukrainian, and Bessarabian provinces known as the Pale of Settlement.

Because of high birth rates, employment restrictions, and other forms of discrimination, many Russian Jews were impoverished. Frequently labeled as exploiters and enemies of Christ, Jews also became identified with antitsarist political movements. In 1881–1882 after the assassination of Tsar Alexander II, a wave of pogroms, or anti-Jewish riots, broke out. Perhaps 120,000 Jews lost their homes or suffered major property destruction. Between 1880 and 1914 about one-third of imperial Russia's Jews emigrated, many going to the United States.

The next major pogrom occurred in 1903 in Kishinev (Chişinău), in Bessarabia, after a local newspaper accused Jews of ritualistically murdering two local youths. Forty-seven Jews died, and 1,300 homes and shops were burned or looted. The Kishinev Pogrom encouraged Jews and socialist organizations to form self-defense units. When a pogrom occurred in Gomel in September 1903, these self-defense organizations helped protect members of the community.

In 1904 during the Russo-Japanese War, army reservists, angered at having been called to duty, committed pogroms against Jews at mobilization points. Since Jews were prominent in the socialist movement, anti-Semitic tensions mounted during the strikes and disorders collectively called the Revolution of 1905. After a general strike spread throughout the country in October 1905, Tsar Nicholas II issued the October Manifesto, an extraordinary concession that provided protection for civil liberties and established Russia's first modern parliament, the Duma. A wave of retaliatory pogroms quickly broke out, sometimes even as crowds were celebrating news of the manifesto. In Kyiv, so-called patriots attacked 1,800 homes and shops, killing 100 Jews. In Odessa, which had a long history of pogroms, an estimated 10,000 families were victimized, and as many as 850 Jews died. Within a few weeks, some 700 communities had witnessed pogroms, mostly in the southern provinces of Ukraine and in Bessarabia. Where the Jewish Bund had organized stronger self-defense units, in Belarus and Lithuania, there were far fewer pogroms.

While the tsarist government probably did not organize the pogroms, violence generally occurred with the tacit consent of local authorities

Corpses of Jews massacred in the pogrom at Proskuriv in Ukraine, February 15, 1919. (Getty Images)

and sometimes with their participation. Mobs were generally small and easily dispersed, but police and local officials often refused to challenge them, signaling that pogroms were permissible (for three days, rumor had it). In 1905 Kyiv's mayor disappeared as its pogrom began, and the police chief and military commander who were responsible for maintaining order actively encouraged the mobs. In a few cities such as Kharkiv, decisive action by local authorities and by socialist self-defense militias prevented massive pogroms.

Imperial Russia's 1903–1905 pogroms were similar in nature and description to outbreaks of racial violence in the United States in the early twentieth century and, more recently, communal violence in India. Political scientist Paul Brass believes that pogroms and other forms of ethnic disorder occur mainly in cities where networks of potential mob activists are permitted to organize and prepare for attacks against targeted minorities. Riot-specialists—rumor mongers or arsonists, for example—can readily convert smoldering tensions into destructive riots when allowed to do so. Some carry lists, directing the mobs to the apartments and workplaces of intended victims. In Ukraine, as elsewhere, pogroms ravaged targeted minority communities where and when authorities refused to intervene, often blaming one another for the inaction and destruction. Where officials made it clear that violence would not be tolerated, it generally did not occur.

► POGROMS IN RUSSIA AND THE SOVIET UNION

The *Protocols of the Elders of Zion* is a literary forgery that claims to detail an international Jewish conspiracy for world domination. Although its origins remain the subject of much debate, the *Protocols* is believed to have first appeared in print in 1903 in Russia. The *Protocols* became increasingly popular within Russia but did not gain international attention until the onset of the Russian Revolution of 1917. Since many prominent Bolsheviks, in particular Leon Trotsky, were Jewish, the overthrow of the tsarist state and the rise of the communists were seen by some as a Jewish attack on the old world order. Russian refugees began to spread the *Protocols* throughout western Europe in an attempt to gain support in their struggle against the Bolsheviks. In addition to being used as a means of persuasion, the *Protocols* was used by the White Army to justify brutal acts of violence

against Jews in the Ukraine and Russia. Even long after the White Army had been defeated, the *Protocols* was still receiving a remarkably warm welcome in the West. In England such reputable news agencies as the *Times* fell just short of stipulating to its authenticity, while in the United States Henry Ford ran the *Protocols* in his own newspaper, the *Dearborn Independent*. The *Protocols* was also celebrated by the right-wing factions of the German government and later used as propaganda and justification for the persecution of Jews by the Nazis. The authenticity of the *Protocols* was questionable even at the dawn of its conception and has since been completely debunked as a work of plagiarism and a fraud. Despite this fact, the *Protocols* remains widely distributed in South America and the Middle East as well as among anti-Semitic circles all over the world.

In February 1917 the monarchy collapsed, and in October the Bolsheviks (communists) staged a coup. In the three years of civil war that followed, more than 1,200 pogroms occurred, mostly after May 1919 and mostly in Ukraine. Writing in the collection of essays edited by John Klier and Shlomo Lambroza, Peter Kenez notes that 10 percent of Ukraine's Jews may have died during the violence of 1919–1920. Moreover, in its scale this mass murder of Jews was surpassed only by the Holocaust of World War II. Anton Denikin's Volunteer Army, various anarchist bands, and units associated with Symon Petliura's Ukrainian nationalists were particularly notorious for their pogrom violence. Kyiv experienced its most brutal pogrom while occupied by Denikin's forces, and small communities were victimized as well. In Proskuriv 2,000 unresisting Jews were massacred in three hours. In Fastiv 600 were murdered and 3,250 injured. Both of these towns were in Kyiv province, which accounted for more than half of all pogrom deaths during the Russian Civil War. Sometimes Jews were attacked for their alleged Bolshevik sympathies or sometimes simply for a bottle of *samo-gon* (home brew), which might cost 1,000 rubles in inflation-ravaged Ukraine. Some soldiers partic-

ipated in multiple pogroms as members of different armies. Bolshevik leaders generally opposed pogroms, and the Red Armies committed far less anti-Semitic violence than did their adversaries.

Thus during the Russian Civil War, pogroms became chronic, and they resulted from the breakdown of authority and from economic collapse. Even then, officials and military officers who took decisive action against pogroms could often prevent them or at least mitigate the consequences, but especially in Ukraine such leadership was often absent.

■ Introduction: Peace and Stability

From 1900 to 1945, international organizations and conferences were initiated in an effort to achieve or secure an end to international warfare and the political tensions that gave rise to them. These organizations and treaties were the outgrowth of efforts to alleviate the tensions that led to and grew from two major world wars involving millions of deaths and the destruction of billions of dollars' worth of property. Of particular note were the multiple international conventions in The Hague and Geneva prior to and after World War I that were aimed at establishing international legal frameworks to arbitrate potential conflicts, thereby setting the precedent for international diplomatic organizations such as the League of Nations of the interwar period and its successor, the United Nations. Disarmament and peace conferences, held periodically to discuss international issues regarding the reduction of weaponry and the resolution of contentious territorial disputes, also led to successful yet short-lived periods of international stability. Out of these came major treaties, such as the interwar Locarno Treaties of 1925 and the Kellogg-Briand Treaty of 1928, aimed at establishing diplomatic cooperation between the European Great Powers and the United States to ensure global stability. In similar efforts, naval conferences such as the Washington Conference (1921–1922) attempted to establish suitable naval ratios among Britain, the United States, Japan, and France and prevent disputes among these global naval powers.

—*Abraham O. Mendoza*

Locarno Pact

The Locarno Pact refers to a series of five treaties initialed on October 16, 1925, by the leading powers of Western and Central Europe at the Swiss town of Locarno. The treaties were designed to stabilize relations between France and Germany after a long period of post-World War I hostility as well as to provide a solid basis for peace in Europe. The Locarno agreements were

formally signed in London on December 1, 1925, and the agreements became the centerpiece of European diplomacy until destroyed by Adolf Hitler in the 1930s.

In 1919 the victorious Allies signed the Treaty of Versailles with defeated Germany, ending World War I. Under the terms of the treaty, the Allies stationed an army of occupation in Germany's Rhineland region in order to ensure French security. The Allied forces were to remain in the Rhineland for 15 years. The Germans were also required to pay heavy reparations to the Allies, especially France, which needed reparations payments to rebuild areas of northeastern France that had been devastated by the war. German reluctance and inability to pay reparations prompted the French on January 11, 1923, to extend their occupation of German territory into the Ruhr Valley, a major German industrial center. The Germans responded with a policy of passive resistance. Workers stayed home, and the civilian population refused to cooperate with the French occupiers. The Ruhr occupation triggered a major economic crisis in Germany, featuring a wave of inflation that wiped out the savings of the German middle class. In August 1923 the new German foreign minister, Gustav Stresemann, called off passive resistance and began negotiations with the French.

The idea for Locarno originated with members of the German foreign office who saw the need for a dramatic improvement in relations with the French. They also feared that a continuing impasse over reparations might lead the French to extend their occupation of the Rhineland beyond 15 years. The idea, soon taken up by Stresemann, was to guarantee Germany's borders with France, meaning that Germany would promise never again to attack France. With French security assured, Germany could win more lenient terms over reparations and other issues. Early in 1925 Stresemann went a step beyond the original idea and formally proposed an international guarantee of the territorial status quo in western Europe. Other European powers such as Britain and Italy would join to maintain

➤ GUSTAV STRESEMANN (1878–1929)

Born into a middle-class family in the German capital of Berlin, Stresemann was first elected to the German Reichstag in 1908 as a member of the National Liberal Party. In 1918 he founded the center-right German People's Party. Stresemann served briefly as

(Library of Congress)

German chancellor in the fall of 1923 and played a key role in resolving the Ruhr crisis with France. From 1923 until his death in 1929 he served as German foreign minister. Stresemann is most famous for negotiating the Locarno treaties of 1925 for which he was awarded the Nobel Prize.

—Paul W. Doerr

the peace. In addition, Stresemann pledged that once the Allies left, the Rhineland would remain demilitarized as a testament of German goodwill toward France.

Stresemann's proposal made slow progress, but by October the legal texts had been prepared. Delegates from Germany, France, Great Britain, Belgium, Poland, and Czechoslovakia gathered in the Swiss town of Locarno on October 5. Eleven days later the Locarno negotiators initialed a series of agreements. The key pact was the Treaty of Mutual Guarantee, sometimes also known as the Rhineland Pact. The term "mutual guarantee" simply meant that the obligations of guarantee were similar for all signatories. Germany promised never to attack France or Belgium, and France and Belgium gave reciprocal pledges to Germany. Italy and Britain then guaranteed the German-French-Belgian border, meaning that they promised to assist any signatory that came under attack. Germany then signed arbitration agreements with France and Belgium that renounced the use of force and promised that disputes would be submitted to peaceful arbitration. Germany also promised not to station troops in the Rhineland once the Al-

lies had departed. Finally, Germany was promised admission into the League of Nations.

Germany also signed arbitration agreements with Poland and Czechoslovakia but refused to give a guarantee of German borders with the two nations. Under the terms of the Versailles Treaty, Germany had lost territory to Poland, and a large German minority resided in that part of Poland known as the Polish Corridor. In addition, a large German minority resided in the Sudetenland region of Czechoslovakia. The fact that the Germans would not guarantee their eastern borders implied that Germany wanted territorial revisions in the east; however, by signing arbitration agreements Germany promised that such revisions would take place only after peaceful negotiations. Additional security for Poland and Czechoslovakia was provided when France signed mutual defense treaties with those two countries, also on October 16.

Initialing the agreements prompted celebrations in Locarno and wildly optimistic hopes around the world. Politicians, diplomats, and ordinary people across Europe thought that a new era of peace and stability was at hand. Locarno ended a long period of postwar tension in Europe, and this coincided with an upturn in the European economy. On September 10, 1926, Germany entered the League of Nations, symbolizing the nation's return to the world community. The formal signing of the Locarno agreements took place in London on December 1, 1926.

The three major signatories of Locarno—Great Britain, France, and Germany—all held different interpretations of what Locarno really meant. Stresemann thought that the path had been cleared for the revision of Germany's borders in the east, the French thought that their security against Germany had been assured, and the British thought that French security needs had been met and that Germany was now a member of the world community. Tragically, the high hopes raised by Locarno failed to materialize. The chain of events following the Wall Street stock market crash in late October 1929 ushered in a worldwide economic depression that helped to propel Adolf Hitler and the Nazis to power in Germany. By March 1936 Hitler rejected Stresemann's pledge of goodwill toward the French and sent German troops into the Rhineland,

thereby taking a crucial step on the road to World War II.

Naval Conferences

During the first half of the twentieth century, the various great naval powers of the world sought the creation of international laws governing naval warfare and naval construction. The goals of such legislation were to safeguard the rights of neutrals in time of war and to decrease tensions between countries that might result from a naval arms race.

The twentieth-century efforts to expand the power of international law over naval affairs had its foundation in the 1856 Declaration of Paris, created at the end of the Crimean War (1853-1856). The signatories to this agreement abolished privateering and crafted rules that defined how a nation should conduct naval blockades in order for them to be legal. The goal was to create a relatively safe environment for neutral powers to conduct trade in times of war by establishing uniform legislation governing the conduct of belligerents.

Rising diplomatic tensions between the great naval powers in the early twentieth century led to further attempts at the 1907 Second Hague Peace Conference to foster peace through international arbitration and the creation of laws restricting operations in war. The result was the Hague Convention, consisting of eight stipulations that included a prohibition on the use of underwater contact mines that remained active in excess of one hour and the restriction of naval bombardments in order to limit civilian deaths. The conference also created the International

Prize Court to adjudicate the seizure of property at sea and more clearly set out the rights and duties of neutrals during wartime.

British politicians in the wake of the Hague Conference wished to use the creation of the International Prize Court as a pretext for further agreements to safeguard trade during war. The result was the Declaration concerning the Laws of Naval War, signed in London on February 26, 1909, by ten powers: Austria-Hungary, France, Germany, Italy, Japan, the Netherlands, Russia, Spain, the United Kingdom, and the United States. The plenipotentiaries of these powers sought stricter codification of the terms in the earlier Declaration of Paris through greater definition of contraband and limitations on the conduct of naval blockades. All but the British ratified the declaration, as the British Parliament believed that it would cripple the country's greatest offensive weapon, which was the use of blockade.

The experience of World War I underlined the inherent weakness of international law in the early twentieth century. As there was no effective means to enforce such laws when violated, many signatories to the Declaration of Paris, the Hague Convention, and the Declaration of London violated the agreements in the name of military expediency. The Germans violated the Hague Convention stipulations on mines and shore bombardment, while Britain's blockade of Germany ultimately contravened all the laws ensuring neutral rights.

Renewed efforts to further international law unfolded in the wake of World War I, fueled in part by the desire to avoid such a catastrophic event in the future. In the interwar period, efforts focused on placing limits on capital ship design and the size of the fleets of the world's major naval powers in order to avoid a future naval arms race such as the one that helped fuel World War I. Consequently, the 1921-1922 Washington Conference centered on naval arms reduction talks in which the United States, Great Britain, Japan, France, and Italy took part. These powers agreed primarily to the establishment of tonnage limits for navies. An American proposal that these caps be extended to cover smaller naval craft foundered on French opposition, as the French maintained that the high cost of their army made cheaper naval vessels such

as cruisers, destroyers, and submarines essential to national defense. Additional stipulations included a 35,000-ton limit for future capital ships and a ten-year naval construction holiday pertaining to ships in excess of 10,000 tons displacement with an armament larger than 8-inch (20-centimeter) guns.

The initial effect of the conference was enormous, as it greatly reduced the size of the world's fleets, but it failed in its far-reaching goals. The inability to agree on tonnage limits for smaller warships led to naval competition in the construction of cruisers, destroyers, and submarines. The agreement also suffered, like those of the past, from a lack of means to enforce it. The Japanese and Italians repeatedly violated their tonnage limits and built warships that exceeded the design limitations.

Failures to enforce the Washington Treaty overshadowed further efforts to expand the reach of international law in naval affairs. As in the case of the agreements made before World War I, the stipulations of the treaty ran counter to the national interests of some signatories, while others refused the further extension of international law for the same reason. An example is the 1927 Geneva Disarmament Conference that sought to curb the growing arms race in cruisers. Of the original signatories to the Washington Treaty, the French and Italians declined to discuss further limitations, while the other powers deadlocked on specifics.

Even so, the Geneva Disarmament Conference revealed to the world's leaders, particularly in the early 1930s, that some agreement was necessary to address the growing naval arms race in small craft and the resulting diplomatic tensions. The 1930 London Conference produced new legislation that, on the surface, enhanced the Washington Treaty but practically served little purpose for the same reasons that undermined earlier agreements. The First London Conference of 1930 established tonnage allotments for cruisers, destroyers, and submarines, but the treaty produced during the conference suffered in terms of effectiveness, as France and Italy refused to limit production in ships that they deemed vital to their national defense.

The First London Conference represented the last time before World War II that any of the

major naval powers could reach an agreement concerning the regulation of naval affairs through international law. Rising diplomatic tensions in Europe and the Far East hampered future efforts. The Japanese starkly revealed this state of affairs when in August 1934 they announced their intention to abrogate the Washington Treaty for the sake of their national interest, which at the time was an expansionist policy in the Pacific that relied on naval power. The Second London Conference that unfolded during late 1935 and early 1936 accomplished precious little, as both the United States and Great Britain left the conference over Japanese demands for parity in tonnage allotments of capital ships.

In retrospect, the naval conferences in the first half of the twentieth century did little to either constrain the use of naval power in wartime or limit arms production. Each agreement rested solely on the goodwill of the participants. Many participants violated them when they became a hindrance to national policy objectives in peacetime or wartime. Even so, the conferences serve as pretexts for the agreements of the twenty-first century in the sense that international maritime law governing neutral rights in time of war remains the law of the sea.

League of Nations

Originating at the Paris Peace Conference of 1919, the League of Nations was an international institution dedicated to maintaining world peace. The Paris Peace Conference drafted the Treaty of Versailles, the treaty that ended the war between

the Allied Powers and Germany. The charter for the League was written directly into the Treaty of Versailles. The League, with its headquarters in Geneva, Switzerland, consisted of a Secretariat, a Council, an Assembly, and a number of humanitarian organizations. The League held its first meeting on January 10, 1920. While the League enjoyed some success in settling minor disputes among European powers in the 1920s, it failed to prevent Japanese aggression in Manchuria in 1931 and Italian aggression in Ethiopia in 1935. By 1936 the League was effectively marginalized in European diplomacy and was disbanded in 1946, to be superseded by the United Nations.

Long before the twentieth century, writers and thinkers had floated plans for an international organization, but it took the carnage of World War I to build popular support for the concept. In 1915, the League of Nations Union was founded in Britain to promote the idea of a post-war international organization. Three years later, U.S. president Woodrow Wilson, in his Fourteen Points speech to the U.S. Congress, called for an international organization to uphold the peace, while at the same time the British government set up a commission to study the idea and make specific recommendations.

As set out in its charter, the League of Nations was composed of a number of different parts. The Secretariat, led by the secretary-general, carried out most of the day-to-day bureaucratic functions of the League. The Assembly was made up of all the member states of the League, with each state having one vote. The Assembly met once a year, with its session starting in September. In addition, the League Council comprised five permanent members plus four elected nonpermanent members serving three-year terms. The Council met four times a year plus any extraordinary sessions as required. Finally, a number of humanitarian organizations, such as the Commission for Refugees, the International Labor Organization, the Health Organization, and the Permanent Court of International Justice, came under the League umbrella. League headquarters were established in the Palais des Nations in Geneva, Switzerland, in 1920.

Member states of the League of Nations pledged to respect national boundaries and refer disputes to the international body for peaceful

➤ LEAGUE OF NATIONS MALARIA INVESTIGATION COMMITTEE

(Library of Congress)

The spectacular political failures of the League of Nations have overshadowed the successes of the League's humanitarian organizations. The Health Organization undertook highly successful campaigns against malaria and typhus. —Paul W. Doerr

resolution. Aggressors could be punished by economic sanctions, and the Council could also recommend military action. The League was also charged with the task of promoting international disarmament.

The League of Nations ran into serious obstacles from the very start. Reflecting a new mood of isolationism, the U.S. Senate rejected the Treaty of Versailles in 1920. As a result, the United States never joined the League. The absence of such a major power was a serious blow to the strength of the League. Germany was not initially allowed to join, and neither was Russia, then in the throes of a civil war. Britain and France dominated the League from the start, leading critics to charge that the League was not an impartial body but rather a winner's club for enforcing the Treaty of Versailles. The League

also had no means of enforcing its will other than relying on the good graces of the major powers to do so.

The League of Nations had some successes in the 1920s, settling minor disputes among European states, such as a border dispute between Greece and Bulgaria in 1925, and the dispute over the Åland Islands between Finland and Sweden in 1921. Germany joined the League in 1926 at a time when international tensions seemed to be lessening. However, the League was unable to prevent the Japanese conquest of the northeastern Chinese region of Manchuria in 1931. The attack on Manchuria was a clear act of aggression; however, none of the Great Powers had the will or capability to confront Japan. Condemned as aggressors, the Japanese simply walked out of the League in 1933 and remained in Manchuria.

Supporters of the League of Nations reasoned that Manchuria was a distant conflict, and the League still had relevance for Europe, then the center of world power. But Adolf Hitler, elected chancellor of Germany in 1933, scorned the League as a product of the Treaty of Versailles. Germany left the League in 1933. The USSR was finally allowed to join the League in 1934, but by that time the League's credibility was in decline. The League failed to respond to the Italian attack on Ethiopia, a League member, in 1935. Once again, Great Powers such as Britain and France were reluctant to go to war in support of the League. The outbreak of World War II in 1939 marked the final failure of the League.

The League of Nations held its final session in 1946, when it voted to dissolve and transfer all its assets and humanitarian organizations over to the newly created United Nations. The League's health organization, for example, became the World Health Organization. The Palais des Nations in Geneva today serves as the European headquarters for the United Nations.

Kellogg-Briand Pact

Signed on August 27, 1928, the Kellogg-Briand Pact, also known as the Pact of Paris, attempted to outlaw war as an instrument of national policy. The main movers behind the pact were Frank Kellogg, American secretary of state, and Aristide Briand, the French foreign minister. The pact was a product of post-World War I idealism and was eventually signed by almost all the independent nations of the world. But it lacked an enforcement mechanism and was ignored as Europe headed to war once again in the 1930s.

The Kellogg-Briand Pact originated in 1927 when James Shotwell, an American university professor who headed the pacifist Carnegie Trust, suggested to Aristide Briand that France and the United States should make a joint declaration renouncing the use of war. The declaration would mark the passage of just over ten years since the American declaration of war against Germany. Briand took up Shotwell's idea and made a formal proposal to the American government in June 1927.

Briand, as foreign minister, was trying to draw the United States closer to France as a way of ensuring French security against Germany, and a joint declaration rejecting war was an ideal first step, especially from the point of view of public relations. The French leaders had hoped that the United States would remain active in European affairs after World War I ended, and they were bitterly disappointed when the U.S. Senate rejected the Treaty of Versailles and membership in the newly formed League of Nations in 1920. Plans for a formal French-British-American defensive alliance against Germany had also fallen through. Although European international relations had improved somewhat in the mid-1920s, especially after the signing of the Locarno Pact in 1925, the French remained uneasy about their long-term security against Germany, which had a larger and faster-growing population and a

superior industrial base. Briand believed that involving the United States in a joint diplomatic declaration would reignite American interest in Europe.

The American secretary of state, Frank Kellogg, found that Briand's proposal put him in a difficult position. Americans who supported the League of Nations as well as antiwar pacifists had been disappointed by the American refusal to join the League of Nations. Agreeing to Briand's proposal would certainly win support from those quarters. But isolationist sentiment was overwhelmingly strong in the United States in the late 1920s, and involvement in European affairs would not be looked upon kindly. Kellogg also, with reason, suspected that the French were trying to enmesh the United States in a formal military alliance. At the same time, an outright rejection of Briand's proposal would put the United States in a poor light.

Kellogg's solution was ingenious. He suggested that all governments of the world—not just the United States and France—should sign a statement renouncing the use of war. Accordingly, the Kellogg-Briand Pact, more properly known as the Pact of Paris, was signed in the French capital on August 27, 1928. According to the first article of the treaty, the signatories renounced the use of war as a means of settling disputes. The second article pledged that the signatories would settle conflicts solely through peaceful means. The treaty would enter into force on July 24, 1929, with an indefinite duration. Eleven states initially signed the treaty in Paris, 4 additional states added their signatures before it came into force, and eventually almost all the independent states of the world signed on, 62 in total. An optional clause to the treaty pledged that signatories would submit justifiable international disputes to the Permanent Court of International Justice.

The Kellogg-Briand Pact was a statement of good intentions with no enforcement mechanism. Today it is widely ridiculed as an example of naïveté in the practice of international relations. Governments almost immediately tried to back out of what they had just signed. The British government stated that the pact did not apply to certain unspecified areas of British national interest. Although the U.S. Senate rati-

Frank Kellogg, representing the United States, signs the Kellogg-Briand Pact in Paris on August 27, 1928. Also known as the Pact of Paris, this international treaty was an ambitious attempt to outlaw war as an instrument of national policy. It failed in this purpose but later provided the legal basis for the Nuremberg trials. (Topical Press Agency/Getty Images)

fied the Kellogg-Briand Pact with only one negative vote, some senators argued vociferously that the pact did not override the American government's right to make war and did not force it to take action against states that broke the terms of the pact. The pact failed to stop Japan from attacking China in 1931 and again in 1937 or Italy from attacking Ethiopia in 1935.

However, it is important to remember that the pact almost perfectly symbolized the hopes of an era and that public opinion received it rapturously. World War I, or the Great War as it was then known, was still a very recent memory, and people all across the world ardently wanted to believe that its horrors would never be repeated. Frank Kellogg was awarded the Nobel Peace Prize in 1929 for his efforts in promoting the pact; Aristide Briand had been awarded the prize in 1926 for his part in the Locarno Pact. The Kellogg-Briand Pact helped to advance the idea that war is an unacceptable instrument of national policy. Aggressor states such as Japan and Italy in the 1930s avoided making formal declarations of war partially in order to avoid condemnation under the terms of the Kellogg-Briand Pact. Finally, the Kellogg-Briand Pact was used to prosecute leading Nazis at the Nuremberg Trials after World War II on the grounds that they had conspired to destroy the peace of the world.

—Paul W. Doerr

THE PACT OF PARIS

The Kellogg-Briand Pact, or the Pact of Paris, renounced the use of war as an instrument of national policy. The pact was signed in Paris on August 27, 1928. Eventually almost all independent nations in the world signed the pact, which technically remains in force. The key provisions of the pact were contained in Articles One and Two.

Article 1

The High Contracting Parties solemnly declare in the names of their respective peoples that they condemn recourse to war for the solution of international controversies, and renounce it, as an instrument of national policy in their relations with one another.

Article 2

The High Contracting Parties agree that the settlement or solution of all disputes or conflicts of whatever nature or of whatever origin they may be, which may arise among them, shall never be sought except by pacific means.

Global Economic Motivations for Peace

By 1900 one of the primary motivators for maintaining peace and avoiding war for most industrialized nations was the economic costs involved in warfare. These costs were calculated not only in terms of the human and material resources involved in fighting but also because wars generally initiated periods of commercial instability and disrupted trade links, interna-

tional communication networks, and credit and finance arrangements. Peace, especially between the industrialized states (including Great Britain, France, Russia, Germany, the United States, and to some extent Japan and China) was conducive to international economic stability, profit, and growth and was recognized as such.

Not surprisingly, numerous attempts were made in the nineteenth and early twentieth centuries to prevent the outbreak of war between the Great Powers through diplomatic discussions, such as the Congress of Vienna (1815), the Peace of Paris (1856), and the Kellogg-Briand Pact (1928). Efforts also included the development of the international law of war and multilateral agreements, such as those initiated at The Hague in 1899 and 1907. The delineation of the law on neutrality in these discussions was especially significant, as it offered the possibility for nonbelligerent states to continue trading in wartime as long as they upheld strict standards of impartiality toward the warring states and did not trade in contraband (war goods).

At least until the outbreak of World War I (1914–1918), it looked likely that neutrality offered a real option for states to stay out of the conflicts of others and to gain maximum economic benefit from those wars. However, as World War I as well as World War II (1939–1945) showed, neutrality could not be safeguarded in time of total war, and this has led historians to claim that the period 1914–1945 witnessed the death of neutrality.

Until the outbreak of World War I, the world economy was growing to the general benefit of the industrial powers. However, the competition for the world's resources inaugurated by industrialization also placed pressure on the peaceful relationships between these powers and challenged the logic and dominance of liberal ideologies in Western states, namely that free trade benefited all. In part, therefore, the diplomatic tensions that brought about World War I came out of economic competition and rivalry.

World War I would prove disastrous for the wealth and well-being of all involved, including many neutral countries. The war not only reversed the growth of the world economy but also witnessed the collapse of the central position held in that economy by states such as

Great Britain, Germany, and France. In recognition of the economic impact of the war, the peace treaties signed at the end of the conflict, including the Treaty of Versailles, focused on recuperating some of the immense costs involved. This demand, however, had the result of destabilizing the international system even more, indirectly contributing to the onset of the Great Depression (1930s) and, some historians argue, World War II. Still, what both World War I and the Great Depression suggested to many at the time was that the world could not afford any more large-scale wars. This perception underpinned the appeasement policies of the Western powers, especially Great Britain and France, in their diplomatic relationships with aggressive states such as Germany, Japan, and Italy in the mid to late 1930s.

The establishment of the League of Nations (1919) also reflected the reality that the world had become economically interdependent, a process that had started in the nineteenth century with the mutually reinforcing developments of industrialization and imperialism. In an acknowledgment to the financial devastation wreaked by World War I, the collective security model proposed by the League of Nations aimed to protect the world from war and thereby ensure a peaceful environment for states to recover their economic positions and interests.

Tellingly, the Soviet Union and Germany were initially denied entry to the League of Nations, a reflection of the economic parameters of the organization. The Soviet Union, as a proclaimed communist state, would not adhere to the same economic rules as the rest of the world; Germany was denied the opportunity to function as an equal in the world economy due to its supposed responsibility for the outbreak of World War I. Furthermore, the League of Nations' primary means of ensuring compliance with its decisions was by members imposing economic sanctions on errant nations. Hence, trade and economics featured as two of the principal elements of interwar collective security and foreshadowed Western attempts in the aftermath of World War II to regulate the world economy even more carefully through such institutions as the World Bank.

—Maartje Abbenhuis-Ash

➤ NEUTRALITY IN THE WORLD WARS

Due to international law developments in the nineteenth century, by 1914 neutrality (the noninvolvement in war) was a valid foreign policy option for many states. Neutrality not only offered the chance to avoid military involvement in a conflict but also guaranteed neutrals trading privileges and protection from the economic warfare policies of belligerents. However, during World War I the pressures of industrial war were such that all the belligerents challenged or disregarded their responsibilities to protect neutral rights. The Allied blockade and the German U-boat campaigns made it especially difficult for the European neutrals, including the Netherlands, Denmark, Norway, Sweden, Switzerland, and Spain. They suffered similar economic deprivations as their warring neighbors.

This war witnessed the decline of neutrality, and in the era of the League of Nations' collective security (1920s), neutrality became almost obsolete. However, in the uncertain diplomatic times of the 1930s and in response to the failure of the League of Nations, many states returned to their traditional positions of neutrality. Ultimately, World War II, a far more total war than its 1914–1918 predecessor, witnessed the near complete disregard of neutrals' international rights by both sets of belligerents, so much so that it was more appropriate to label the few neutral states that did survive the war, including Switzerland, Sweden, and Spain, as nonbelligerents rather than neutrals.

World Disarmament Conference

Building upon the success of the Naval Conferences of 1921 and 1930, the League of Nations convened the Conference for the Reduction and Limitation of Armaments in February 1932. Representatives from all of the major nations of the world, with the exception of Japan, converged in Geneva. The Japanese had only recently invaded Manchuria and were preoccupied with events within China. Although the conference had been designed as an attempt to negotiate a reduction of armament levels, in the end it demonstrated just how divided the world was and how ineffective the League of Nations had become at brokering agreements among the major powers.

When the conference began, the United States and Great Britain faced significant popular pressure at home to restrict the arms race. Following the atrocities of World War I, both nations hoped to avoid any future conflicts, and both faced difficult economic times that restricted military spending. As a consequence, the two governments were willing to consider serious limits on offensive weapons. In contrast, France hoped to remain well armed, at least in comparison to Germany. The French continued to embrace the position that a severely weakened Germany was the key to French national defense. At the same time, the German populace continued to pressure the Weimar government to defy the French and ignore the harsh conditions of the Treaty of Versailles (1919). The Ital-

ian government of Benito Mussolini, despite its militant style, was open to disarmament as long as Italy maintained parity with France. Finally, the Soviet Union supported a position of general and complete disarmament.

Faced with such major divisions, the conference made little significant progress. In June 1932 the United States proposed the abolition of offensive weapons and the reduction of all other weapons by one-third across the board. The U.S. proposal included such vague definitions as battleships being construed as defensive weapons. Such weaknesses, coupled with the absolute refusal on the part of the French to disarm in the face of growing German militancy, crippled the U.S. proposal almost immediately. As the conference prepared to adjourn for a summer break, the German delegation announced that it had no plans to participate further without guarantees of military parity between Germany and France. The British and American delegates worked tirelessly to craft a compromise, and the German delegation agreed to their efforts. As the international delegates departed Geneva, the conference was scheduled to resume on January 31, 1933.

In the interim months the German Weimar government collapsed, and Adolf Hitler assumed power as chancellor. The governments of Britain and France reacted very differently to the news of the ascendancy of Hitler's National Socialist German Workers Party (Nazi Party) in Germany. Britain considered even more seriously dismantling the hated Versailles restrictions on Germany in order to erode a cornerstone of Nazi power. France stood more resolutely than ever on using the Treaty of Versailles to isolate and weaken Nazi Germany.

During the spring months, French diplomats undertook significant efforts to modify the British position. At the same time, the new Nazi regime began to dismantle the institutions of democracy in Germany and to openly persecute Jews. As a consequence, the events in Germany forced a change in British public opinion, and the British government sided with France in proposing new pacts that merely reaffirmed the existing restrictions on Germany.

In the United States, Franklin Roosevelt came to power in March 1933, and his govern-

ment undertook efforts to reduce the U.S. level of cooperation with the League of Nations in response to a surge in isolationist feelings at home. Thus, participation at the conference by the United States became perfunctory and ineffective beginning in July 1933.

Hitler destroyed any hope for the success of the World Disarmament Conference by formally withdrawing German participation in October 1933. At the same time, he began proceedings to withdraw Germany from membership in the League of Nations. As a consequence of these events, the conference collapsed. Although formal meetings were held during 1934, no significant agreements were produced. Conference delegates met irregularly over the course of the next several years; however, no meetings were held after May 1937.

The World Disarmament Conference demonstrated many of the cracks that had begun to form in the foundations of peace that had been laid by the early 1930s, such as the Kellogg-Briand Pact. Franco-German distrust was escalating almost daily. Germany had abandoned democracy and had embraced the nationalist—and anti-French—rhetoric of the Nazis. The conference had marked the entry of the Soviet Union into mainstream diplomacy; however, that movement was offset by the departure of the United States, which had become preoccupied with domestic affairs. The British found themselves in an increasingly uncomfortable situation and moved closer to France.

The conference clearly demonstrated the weakness of the League of Nations as a peace-making body. The irony of holding a disarmament conference in the shadows of Japan's aggressive war against China was not lost on observers. The failure of the Disarmament Conference proved to be one among a string of failures that heightened tensions until Europe exploded in war in September 1939.

Peace Movement

In the twentieth century, the peace movement across the world grew intensely as two world wars and the threat of nuclear conflict galvanized a diverse segment of the population into organizing. The groups that joined to work for peace and disarmament were often united in other causes, including civil rights, the feminist movement, and protection of the environment.

Since the Reformation, a number of religious sects have emerged with pacifism as a central tenet of their beliefs. The Quaker Church is the best example of this sort of movement. As the sects spread around the world, especially in the United States, they took their message of peace and antiwar with them.

The modern peace movement, however, had its beginnings during the nineteenth century. The earliest nonsectarian groups formed for the purpose of promoting peace were the New York Peace Society and the Massachusetts Peace Society, both formed in 1815. The very next year the Society for the Promotion of Permanent and Universal Peace was formed in England. Other societies in other European countries followed in subsequent years. The leaders of the movements were generally bourgeois liberals, especially professionals.

Several world peace conventions, which gathered advocates from several countries, were held in the middle of the nineteenth century. In 1889 the World Peace Congress convened in Paris, France, and was held annually until the beginning of World War I. The First Hague Peace Conference was held in the Netherlands in 1899 with the goal of promoting international peace and methods by which nations could arbitrate their difference. If the conference's goal of peace failed, its delegates did attempt to devise rules by which war would be waged. In 1901 the first Nobel Peace Prize was awarded to Henry Dunant, founder of the International Committee of the Red Cross, and Frédéric Passy, a prolific writer against war.

In the United States by the eve of World War I, more than 40 peace organizations had been created as professional Americans began to realize that working for peace was an important public responsibility. In 1914, for example,

former president William Howard Taft helped to fashion the League to Enforce Peace, a citizen pressure group. The league attempted to persuade President Woodrow Wilson to create a mechanism for the collective enforcement of international law in order to prevent war. The outbreak of World War I that year, however, brought increasing difficulties for peace advocates, who now confronted charges of treason and unpatriotic behavior when they criticized the war effort. Nevertheless, Leftists, humanitarians like Jane Addams, and other groups of Progressives—including social workers, urban intellectuals, and social radicals like Emma Goldman—formed a powerful antiwar group. Though the antiwar effort showed surprising strength in the mid-western United States and among Scandinavian and German ethnic groups, it was destroyed by a heightened law enforcement and censorship campaign undertaken by the federal government and the infant U.S. Federal Bureau of Investigation (FBI).

In Europe the most visible attempt by private citizens to promote peace during the war was the International Congress of Women, held in The Hague in 1915. This international group, dedicated to feminist causes before the war, brought together women from all the warring countries to discuss methods of settling national differences. Although unsuccessful, the attempt led in 1919 to the formation of the Women's International League for Peace and Freedom.

A general revulsion toward war followed the end of World War I. The League of Nations became the focus of efforts to stop international conflict. Although hampered by the failure of the United States to join, the league brought together most of the other countries of the world. Peace organizations formed before the war resumed their efforts along with new groups formed in the 1920s and 1930s. The main aim of most groups was pacifism. In smaller countries in particular, peace activists hoped to withdraw from entangling alliances and preached isolation from big-power conflicts. Peace activists greeted disarmament conferences, designed to make World War I the "war to end all wars," with relief and joy. Their greatest complaint was that the conferences did not do enough to make future wars unlikely.

Prior to World War II, the peace movement in the United States atrophied in the wake of a lack of militancy on the part of the U.S. government and a disinterest in world affairs prompted by the ravages of the Great Depression. Once the United States joined the war, though, conscientious objectors (COs) earned the support of American pacifists like A. J. Muste as well as peace churches and other Protestant denominations. Quakers, for example, founded the American Friends Service Committee, which provided alternative wartime service for COs. Others followed the teachings of Mahatma Gandhi and the Congress of Racial Equality to agitate instead for solutions to domestic disharmony. Despite their efforts, peace enthusiasts watched in horror as the "good war" destroyed more than 55 million people.

The end of World War II left most countries exhausted, but the rapid beginning of the Cold War between the United States and the Soviet Union led to the rebirth of the peace movement around the world. Europeans in particular were quick to realize that a future war between the superpowers could be fought in Europe with nuclear weapons. The first large postwar peace movement organized in western Europe between 1958 and 1965. A coalition ranging from mothers to students to trade unions worked for disarmament in Europe. Antiwar activities in the Soviet Bloc were less well defined and generally attacked imperialism among the Western powers.

■ Introduction: Atrocities of Modern Warfare

The term “total war” denotes a concept that has come into increasing use in the modern age. Total war describes the transformation of modern war over the last two centuries from a limited activity, carried out by professional armies on clearly defined battlefields, to the all-encompassing efforts of entire nations to destroy their enemies completely. The development of total war began in Europe at the end of the eighteenth century and has extended into the age of nuclear weapons. Unfortunately, along with total warfare came major wartime atrocities.

Although the Franco-Prussian War of 1870–1871 gave many indications that war was becoming total, it was World War I that fully displayed the increasing scale and destruction of armed conflict in the modern age. Nations went to war in 1914 largely ignorant of the effects that modern weapons would have. Though there were many theaters of operations around the globe, the decisive front was in France, where the German Army faced French and British forces in a stalemate of trenches and barbed wire.

As the war dragged on and months faded into years, each belligerent mobilized more and more of its national resources. Gigantic artillery pieces, machine guns, submarines, flamethrowers, poison gas, airplanes, and other new weapons made the battlefield a nightmare landscape of death and suffering, while the need to produce those weapons oriented entire national economies toward production for the war effort.

World War II was the apotheosis of modern conventional warfare and saw the realization of the true potential of the dual nature of total war: the complete mobilization of entire nations’ populations and economies to field large armies with weapons of enormous destructive power and the targeting of those populations and resources by enemy militaries so as to deny the armies the sustenance they needed. Such developments transformed the world into a battlefield, and the distinction between the front lines and the home front nearly disappeared. Everything became a military target, from soldiers, tanks, and battleships to civilian workers, factories, and homes.

During World War I the British blockade of Germany, which denied the Germans important natural resources and food, and German submarine warfare had demonstrated the trend toward this kind of total war, but World War II took those practices to extremes. Planes bombed cities to destroy both industry and the will of the enemy to fight. Surface naval and submarine warfare once again sought to deny essential resources to the enemy in an even more intensive fashion than in the previous conflict.

German leader Adolf Hitler even made war against entire peoples as he sought to exterminate Jews, Slavs, Russians, and any others he thought undermined or stood in the way of Germany’s victorious destiny. At least 50 million people died during the war. Added to that appallingly high cost of lives was the trillions of dollars’ worth of wealth consumed.

World War II also produced a weapon that would propel modern war into an entirely new dimension of destruction and help define the twentieth century as the “century of total war,” as one scholar has called it. On August 6, 1945, the United States dropped the first atomic bomb on the Japanese city of Hiroshima and three days later dropped another one on Nagasaki. The scale of destruction was enormous and brought warfare into the nuclear age. Though nuclear weapons have not been used since, many nations around the world have developed ever more powerful warheads and ever more accurate and rapid delivery systems, including missiles that can cross oceans and continents.

—Richard Fogarty

Soviet War Crimes

The Soviet Union under the control of the general secretary of the Communist Party, Josef Stalin (1922–1953), followed an ideological set of objectives throughout the trajectory of the Great Patriotic War (World War II) against Germany and its fascist allies that called for the elimination of potential sources of insurrection and opposition to Soviet rule in zones of occupation. The Red Army

Partially emptied mass grave at the Katyn Forest massacre site in 1943, an overt example of the war crimes of the Soviet military. (AP Photo)

and the NKVD (Soviet secret police) along with various collaborationist officials in occupied zones were responsible for various atrocities that could be construed as war crimes by definitions already set by international law (such as the Geneva Convention). However, in the course of their undertaking many of these were overlooked by the Grand Alliance (the United States, Britain, France, and China) as long as the Soviet Union was an ally against the Axis Powers.

The signing of the Nazi-Soviet Pact (also known as the Molotov-Ribbentrop Pact) of 1939 ensured nonaggression between the Soviet Union and Nazi Germany in the event of war between Germany and the Western Allies. It possessed a secret protocol for the division of eastern Europe into spheres of influence between the two signees. In particular, Poland, which had been part of the patrimony of the Soviet Union since the days of the Russian tsars, was coveted by Stalin because it had been lost in 1922 at the end of the Russian Civil War. Late in September after the German invasion of Poland, Soviet troops entered the eastern half of Poland and quickly asserted their control over the region. Almost immediately, the Red Army and Soviet commissars set about eliminating Polish elements deemed dangerous to Marxist-Leninist political objectives for the new Soviet Poland.

The Katyn Forest Massacre was a mass execution of Polish citizens ordered by Soviet au-

thorities on March 5, 1940, estimated to have left approximately 22,000 dead, murdered by the Red Army and other Soviet officials in the Katyn forest and surrounding areas. Approximately 8,000 of these were military officers taken prisoner during the 1939 invasion of Poland. Others were Poles arrested as spies, saboteurs, and class enemies, a designation given to property owners, lawyers, Catholic priests, and government officials. The Soviets were able to round up most of the Polish intelligentsia due to the fact that Poland's conscription system required university graduates to serve as reserve officers with no exemptions. This episode was later used by the Germans, subsequent to their invasion of the Soviet Union in 1941, as propaganda to the West to illustrate the atrocities committed by the Soviets to the Western Allies later in the war.

As the Red Army advanced against the German Wehrmacht (Armed Forces) between 1941 and 1945, it also undertook various actions against both the allies of the Germans and the class enemies of the Soviet people. Partisan warfare was common behind the German lines, as Soviet partisans fought both the Wehrmacht forces and competing partisan forces that were both anti-Soviet and anti-Nazi. Furthermore, German-occupied Soviet villages that allegedly helped the enemy were subjected to Soviet retribution in the form of summary execution of the town's leaders or the destruction of the entire community. As the war raged across the eastern front, the Red Army entered formerly occupied German countries and satellite states such as Czechoslovakia, Hungary, Romania, and Poland, exacting vengeance on thousands of collaborators and alleged collaborators with the assistance of local resistance movements.

The Warsaw Uprising of 1944, crushed by German forces, is partly attributed by various historians to the Soviets' reluctance to enter Warsaw. Allegedly the Red Army halted at the Vistula River after having pushed a German retreat behind Poland and after having overstretched their forces. The Polish resistance had expected the Red Army to liberate Warsaw and had begun taking the initiative in attacking the German occupiers before this occurred. The Red Army halt allowed German forces to stamp out the revolt while it stood a few miles outside the city and

➤ EXACTING VENGEANCE—GERMANS AND THE RED ARMY

From 1941 to 1945 as the Red Army pushed the German Wehrmacht back into Germany, it also uprooted and displaced millions of ethnic Germans (*Volksdeutsche*) from formerly Nazi-occupied eastern Europe. Thousands of these ethnic Germans were ethnically cleansed through evictions, rapes, executions, and their placement in concentration camps by the Soviets or their allies, while those who survived were forced to flee in droves into Germany. According to estimates, from one million to two million Germans died in the late 1940s as a result of these actions. As the war drew to a close, the Red Army advanced into Eastern Germany and ultimately Berlin. Along the way, Red Army soldiers were responsible for the rape of

hundreds of thousands of German women. Both young and old German women were subjected to multiple rapes a day, sometimes to episodes of gang rape, by mostly drunken Soviet soldiers. Many women committed suicide rather than live in this condition. Also, German soldiers captured by the Red Army were subjected to abuse and starvation. Millions of German POWs were shipped into the Soviet Union to serve as slave labor in the Gulag camps, many of them spread over the vast expanses of Siberia, with droves of them dying of disease, starvation, exposure, and overwork. The last of these German POWs were repatriated in 1956 after an estimated 400,000 had died.

waited, leading to Polish accusations of being an accomplice to German war crimes.

Confinement of Enemy Aliens during Times of Domestic Crisis

In the first half of the twentieth century, the confinement of enemy aliens during times of domestic crisis was ubiquitous in much of the West, although to a lesser degree than in times of war. Nonetheless, domestic fear of foreign ideologies, particularly nationalism, communism, and fascism, allowed governments in Britain and the United States to circumvent their own re-

gard for the civil liberties inherited from the Enlightenment in order to arrest, imprison, and deport foreign nationals deemed to be a threat. The authoritarian regimes of tsarist Russia, imperial Germany, and Habsburg Austria-Hungary also persecuted foreign nationalist and socialist agitators, particularly those deemed harmful to maintaining their already-fragile multiethnic empires. After the collapse of these empires following World War I, their successor states also proved capable of doing the same to their own ideological enemies.

Fear of communism, particularly after World War I and the outbreak of the Russian Revolution, pervaded the United States and Britain. Socialist agitators and trade unionists from abroad suspected of having ties to the Soviet Union were apprehended and detained without right to an attorney and denied their civil liberties. The Red Scare of the early 1920s in the United States involved a series of raids on socialist organizations suspected of having overseas links to the Soviet Comintern. While some of the suspects were indeed linked to the Soviet Union and were actively seeking to organize a communist movement in the United States, others were simply at the wrong place at the wrong time. Nonetheless, they were mostly all deported en masse along with other foreign undesirables. In interwar Britain, foreigners were also scrutinized by government

► ENEMY ALIENS IN BRITAIN—GERMAN JEWS

During World War II the British government found it expedient to intern German enemy aliens deemed a threat to the British war effort. However, many of these internees turned out to be German Jewish refugees who had left Germany to avoid persecution. Approximately 60,000 German refugees moved to Britain in the years prior to the outbreak of World War II. Many of these were typically German Jews and Socialists who opposed the Nazis and who had successfully escaped from Nazi Germany. Following the outbreak of World War II, British authorities arrested a large number of Germans residing within Britain. The British government feared that these enemy aliens could potentially be spies posing as refugees. They were thus apprehended and interned in various camps all over Britain, among them the famous Isle of Man internment camp. The living conditions in many of these internment camps were often atrocious, with some internees housed in tents and sleeping on the floor. Husbands and wives were separated, as camps were set up separately for men and women. Internees were forbidden to read newspapers, listen to the radio, or receive correspondence and were thus unable to know what had happened to family members in the Third Reich for years. Many refugees, who had ironically fled to Britain to avoid persecution in Nazi Germany, committed suicide during their internment. Furthermore, many of these internees were shipped to internment camps in Canada and Australia, further exacerbating their desperate situation given the deplorable conditions of the journey by ship and the living conditions in internment camps abroad.

—*Abraham O. Mendoza*

agents particularly after the General Strike of 1927, which was actively supported and subsidized by the Soviet Union. Enemy aliens—albeit at a smaller rate than in the United States—were detained and eventually deported, particularly those who were Soviet agents. Uncertain economic and political conditions allowed both Britain and the United States to engage in coercive police-state tactics with regard to enemy aliens, utilizing scare tactics to convince public opinion of their necessity.

Tsarist Russia, imperial Germany, and Habsburg Austria-Hungary also had problems with foreign nationals serving as socialist or nationalist provocateurs. Prior to their dissolution, these authoritarian states detained enemy aliens—sometimes on legitimate charges but more often than not on trumped-up charges—and subjected them to long prison terms for working with foreign states. Tsarist Russian autocrats, always fearful of liberals and socialists, were quick to deport enemy aliens as well as national political criminals to the stretches of Siberia, particularly after the botched 1905 revolution. Imperial Germany quelled internal discontent by rapidly stamping out socialist uprisings or strikes and was quick to detain foreign nationals active in these movements, particularly nationalists from Habsburg or Russian Poland. Austria-Hungary, rocked by internal ethnic separatism and surrounded by irredentist regimes such as Serbia and Poland, also actively arrested and detained foreign nationalist agitators. These three authoritarian regimes, already known for being police states, had zero tolerance for nationalist provocateurs with claims on what they deemed national territory.

Similarly, their successor states, the Soviet Union, and Nazi Germany (after the short-lived Weimar Republic), respectively, also acted aggressively against foreign agents working against their ideological objectives. The Soviet Union, under the leadership of Lenin and Stalin, actively detained individuals associated with the tsarist regime or bourgeois elements seeking to destroy the workers' state. Many of these were summarily shot if not sent east to the forced-labor camps that constituted the Gulag. In Nazi Germany, Hitler and his secret police agencies—the Sicherheitsdienst (SD) and the Gestapo (contraction of Geheime Staatspolizei)—also were active in eliminating those deemed enemy aliens, particularly Jews, socialists, and communists, from public life prior to the war between 1933 and 1939.

Concentration camps such as Dachau served to detain both internal political criminals and enemy aliens deemed harmful to the National Socialist state, particularly Soviet agents. Both of these states found that the building of their respective ideological states necessitated the removal of foreign elements who threatened this process. Both the Soviet Union and Nazi Ger-

many were born out of chaotic and unstable political and economic conditions that allowed these states to circumvent legal niceties and persecute, arrest, incarcerate, and violate the civil liberties of foreign nationals deemed enemy aliens. These practices would continue to a greater degree in the context of World War II.

Chemical and Biological Warfare

Chemical weapons were first used on a large scale during World War I. The stalemate of trench warfare caused both sides to seek means by which the enemy's troops could be forced into the open. After the French failed to achieve significant results using tear gas munitions, the Germans made a breakthrough with the use of chlorine gas released from cylinders and carried by the wind to enemy lines. In addition to achieving the intended effect of dislodging the entrenched troops, the first use of this gas also unexpectedly caused many fatalities from asphyxiation, and thus began the escalating use of poison gases specifically to inflict casualties.

A typical early attack required 100 tons of gas released from thousands of cylinders that took weeks to position. Since shifts in wind direction could result in more casualties among the attackers than among the intended targets and since the cylinder-release method required preparations that could not be concealed, the cylinder-release technique was soon replaced by the use of gas-filled artillery shells. Although this latter method made delivery more controllable, it also required the firing of hundreds or thousands of artillery shells into a small area over a very short time in order to build up a lethal concentration of gas.

In another breakthrough, the Germans developed mustard gas. Unlike the true gases that drifted as clouds and soon dissipated, the oily

British soldiers blinded by mustard gas line up at an advance aid station near Bethune in April 1918, during World War I. Employed by both sides during the Great War, the use of chemical weapons was banned in 1925 with the Geneva Protocol on Gas Warfare. (Bettmann/Corbis)

chemical agent dichlorodiethyl or so-called mustard gas dispersed as droplets in aerosol form over a very limited area. Depending on the air temperature, these droplets persisted where they fell, from a few hours to several days. Although lethal if enough of the vapor was inhaled, mustard gas generally caused only painful skin blisters of a couple of weeks duration and sometimes temporary blindness.

Approximately seven tons of poison gas were used in World War I for each poison gas fatality. The total number of wounded and fatal casualties from gas have been calculated as exceeding 1 million, but that figure includes unreliable and likely exaggerated numbers from the eastern front. On the western front, fatalities from chemical weapons were approximately 18,000, with total casualties estimated to be just under 500,000, in a war with more than 8 million recorded fatalities, 7 million missing in action, and more than 21 million wounded.

Most military officials disliked chemical weapons because they interfered with normal tactics without providing decisive advantage. Also, being unpredictable and unreliable they needed to be backed up by a full compliment of conventional weapons. The military ambivalence combined with a 1925 conference that led to a proposal for an international ban in 1925 limited

► CHEMICAL WARFARE DURING AND AFTER WORLD WAR I

World War I propaganda portrayed chemical weapons as especially horrible. Military medical records, however, show that fatalities from gas were relatively low. Moreover, nonfatal wounds inflicted by conventional weapons had a much greater chance of causing permanent disabilities than did injuries by gas. Thus, some military officers—most notably the American lieutenant colonel Augustin Prentiss, whose technically and statistically irrefutable book *Chemicals in War* became a standard military reference on both sides of the Atlantic in the interwar period—argued that gas was the most humane weapon and proposed that future wars be fought exclusively with chemical weapons. Ultimately, propaganda images and emotional arguments prevailed. Chemical weapons were vilified and banned. Yet knowledgeable veterans of World War I, such as Brigadier General Jacquard H. Rothschild in his book *Tomorrow's Weapons* (1964), would decades later still propose that United Nations peacekeeping forces use mustard gas as a humane and minimally lethal means to quell international conflicts.

—Leonard Leshuk

the use of chemical weapons in the interwar years. The Italians did use mustard gas extensively in Ethiopia in the 1930s, delivered in bombs or directly sprayed from airplanes. However, even against lightly clothed, barefoot Ethiopians, such unilateral use of chemical weapons was not the decisive factor in that war.

Prior to World War II the Germans made yet another breakthrough with their development of tabun nerve gas (ethyl dimethylphosphoramidocyanide) followed by Sarin (1-methylethyl methylphosphonofluoride) in 1938 and Soman (1,2,2-trimethylpropyl methylphosphonofluoride) in 1944 but never put these gases to use in the battlefield. Interwar experimentation with biological weapons led only to some ineffective World War II uses by the Japanese in China and preparations by the British for an anthrax attack on Germany that was never carried out. The experimentation with biological weapons, how-

ever, led later to many unfounded rumors of their use by various armies during World War II. Furthermore, while all of the major powers considered making first use of the chemical weapons in their stockpiles—and there were some casualties from chemical weapons mishaps during World War II—the major powers ultimately refrained from relying on them primarily due to logistical and tactical considerations.

The Holocaust

The murder of millions of civilians by the Nazi regime in Germany is one of the most tragic and significant events in recorded history. With a cost of perhaps 12 million lives, the worst of the human potential was laid on display in ways that have redefined modern perceptions of race, religion, politics, and morality. During the years surrounding World War II, Nazi doctrines of racial and national superiority led to the maltreatment and murder of Soviet prisoners of war, Polish Catholics, Gypsies, homosexuals, Seventh-day Adventists, and Jews.

The event known as the Holocaust all but destroyed the Jewish presence in Europe and has scarred Germany to the present day. Hatred of the Jewish minority by many in Europe went through various mutations through the years, first under Roman law and then in medieval Europe. Until the modern era, such hatred was more a question of anti-Judaism rather than anti-Semitism, since the religion, rather than the race of the Jews, was deemed to be objectionable. This began to change in the nineteenth century due to terrible misreadings of the work of Charles Darwin.

Some viewed Darwin's work as promoting the idea of race as a scientific category, thus

leading to the rise of the related pseudoscience of eugenics with its program for the selective breeding of humans for racial competition. This intellectual context was in place in the 1920s when Adolf Hitler and the National Socialist German Workers' Party (Nazis) emerged in German politics. Many Germans were receptive to Hitler's arguments about a German race subverted by Jewish infiltrators, especially after the nation's devastating and demoralizing losses in World War I. For many, the Jews simply became an identifiable enemy who could be blamed for the country's problems.

Fueled in part by the appeal of his racial arguments, Hitler and his Nazi Party were able to claim power in Germany in 1933 and immediately began to institute their program against the Jews. At first the persecution was mostly economic, including a 1933 boycott of Jewish businesses, but the persecution grew more radical with time. The 1935 Nuremberg Laws, for example, excluded Jews from many professions and effectively revoked their citizenship.

An important turning point was the *Kristallnacht* (Night of the Broken Glass) of November 1938 when thousands of Jewish properties were burned and thousands of German Jews were mistreated and arrested. The invasion of Poland in September 1939 was a second crucial point of departure, massively increasing the number of Jews in the custody of the Nazis from approximately 500,000 to more than 3 million.

The next step toward genocide came with the invasion of the Soviet Union in June 1941, at which point five million Jews in that country were placed in danger. Although many would escape with the general Soviet exodus to the east, perhaps two million perished. Many of them were killed by *Einsatzgruppen* (Intervention Group) forces composed of *Schutzstaffel* (SS) troops along with army and police units following the German advance and committing mass murder in their wake, usually with machine-gun executions. By the end of 1941, hundreds of thousands of Jews had reportedly been murdered in this way.

It is worth considering that the death camps, the symbols of the Holocaust for many, had not yet been built at the beginning of World War I. This is because the Final Solution evolved over time. So-called intentionalists and structuralists

have argued over the degree to which the genocide was the product of a concrete plan in Hitler's mind, but the argument is largely over just that: a matter of degree. Historians agree that the plan evolved, from the harassment of the Nuremberg Laws to the forced Zionism that saw Adolf Eichmann learn Hebrew and visit Palestine to the *Einsatzgruppen* and death camps. Partially this is because as more Jews fell into the hands of the Nazis and as the war grew more savage, so to did the discourse about Jews in official German circles. Nevertheless, although we acknowledge the evolution of the Final Solution, it is undeniable that the possibility of genocide was there from the moment Hitler—a man who predicted the annihilation of the Jews is acknowledged in a speech in January 1939—took power.

Over the course of 1942 the machinery of death reached its full awful capacity with the construction and operation of a series of death camps, all in Poland. In these camps, new techniques and technologies were employed to speed up the massacres, including the use of poisonous gases in chambers disguised as showers. In that year alone more than four million people were killed, making it the peak of the Nazi genocide.

The Holocaust continued until the end of the war as German and then West European Jews were shipped to the East to take the place of murdered Polish and Soviet Jews, first in the ghettos, then in the camps, and then in the gas chambers. By the war's end, in 1945, the German government was still diverting resources to the camp system even as those resources were desperately needed at the front. The final stage of the Holocaust involved a series of death marches as SS guards herded their last victims back to camps in Germany.

The aftermath of the Holocaust is difficult to evaluate because it is so broad and significant. The most important effect of the genocide was the virtual destruction of the Jewish presence in Europe. The intellectual and moral legacy of the Holocaust is particularly hard to assess. On one hand, it seems a given that politics and moral life after 1945 are heavily influenced by the genocide. From the existentialists to the poststructuralists and from Israel to Germany, much has been remade because of the Holocaust. On the

other hand, genocides have continued. The legacy, then, of the Holocaust might be best described as ambiguous.

Nazi War Crimes

The most infamous aspect of the Nazi period of German history is the genocide and war crimes committed against the peoples of Europe. Approximately six million Jews and more than six million other noncombatants died as a direct result of Nazi atrocities. Millions more died as a re-

Corpses of U.S. Army personnel slain by the Germans after capture near Malmedy, Belgium, on December 11, 1944, illustrative of the German disregard for the rules of war under the Nazi regime. (National Archives)

sult of the war thrust upon Europe by the Nazi war machine. Another part of Nazi brutality came in the form of war crimes against the soldiers who fought against the Axis Powers.

The most vicious fighting of the European theater of World War II occurred on the eastern front during the struggle between Nazi Germany and the communist Soviet Union. Between World War I and World War II, the Soviet Union had not formally endorsed the Geneva Accords on the treatment of prisoners of war (POWs) nor the Hague Agreements on the conduct of war. Using this as an excuse, the war unleashed by Germany against the Soviet Union in 1941 was especially brutal.

The German Army marched into the Soviet Union with orders to kill all captured Soviet political officers, and these orders were carried out almost without exception. When the German invaders captured millions of Soviet prisoners, Nazi officials made a decision to purge the POWs of those whom the Nazis considered dangerous. Anyone thought to be Jewish, part of the intelligentsia, troublemakers, or dedicated Communist Party members were shot. Those not selected for immediate execution were fed little or nothing, and as a result starvation was widespread. In addition, thousands of POWs died on the long death marches west toward German-occupied territory, as German guards shot any POW who fell behind or could not continue. Eventually, when trains were used to transport Soviet POWs, only open cars were set aside for prisoners, causing many to freeze to death. Those who actually made it back to either the POW or concentration camps were also subject to death. About 900 Soviet POWs died in September 1941 in the first trial gassing at Auschwitz-Birkenau using Zyklon-B; at least another 10,000 would eventually perish in its gas chambers.

By the end of the war approximately 5.5 million Soviet prisoners of war had fallen into German hands, of which nearly 3.5 million (or more than 60 percent) were reportedly killed or died; in comparison, fewer than 4 percent of British and American prisoners died in captivity. The majority of the Soviet POWs died within the first year of the German invasion of the Soviet Union. By 1942, with labor shortages growing, the decision was made to select Soviet POWs for slave la-

bor instead of systematically trying to annihilate them. However, even as laborers they were under the constant threat of death, as they were treated poorly and underfed.

Soviet soldiers were not the only ones to face the brutalities of the Nazis. Many Polish officers captured early in the war were killed as part of the German attempt to obliterate any potential leaders. Jewish prisoners from various countries usually faced some of the worst treatment. As mentioned above, Jews among Soviet POWs were selected and usually turned over to Schutzstaffel (SS) death squads for immediate murder. Only those Soviet Jews able to pass as non-Jewish had a chance to survive German capture. Thousands of Polish Jews also became POWs when Germany invaded Poland in 1939. Many of these were shot by the Germans, and most of the others were released back into the local populations as civilians only to face future anti-Jewish measures.

Although the Germans did not undertake the systematic extermination of prisoners of war from the Western Allies, there were many incidences of war crimes against them. During the battle for France in May 1940, SS soldiers shot and killed as many as 100 captured British soldiers. Hitler Youth soldiers killed dozens of Canadian POWs in June 1944 during the fight to retake France from the Germans. There were also several different occurrences of American POWs being shot during the Battle of the Bulge (1944), the most famous happening near Malmédy, Belgium, where more than 80 American POWs were killed.

One group that received especially harsh treatment by the Nazis was captured Allied airmen. The German military, and even civilians, were encouraged by the Nazi government to execute captured flyers. Many airmen who were not immediately killed were turned over to the SS and sent to concentration camps. In 1944 about 50 captured airmen from Britain, the United States, and Holland were sent to the Mauthausen concentration camp, where they were killed by being forced to haul stones out of the quarry until they collapsed (many thousands of Soviet POWs were killed in the same manner). In another incident, Hitler personally ordered the execution of about 50 British airmen who

➤ TOP-SECRET COMMANDO ORDER

One group of Western Prisoners of War that the Nazis ordered exterminated was special forces units or commandos. In October 1942 Hitler issued his Top-Secret Commando Order, which stated: "From now on all enemies on so-called commando missions in Europe or Africa challenged by German troops, even if they are uniform, whether armed or unarmed, in battle or in flight are to be slaughtered to the last man" (Nr. 003830/42 g. Kdos.OKW/WFSt).

Several other orders followed and reiterated that all captured commandos be killed. Those soldiers kept alive for the sake of questioning were to be killed immediately after their interrogation. Also, commanders were told that it was imperative to keep the orders a secret, and they were to destroy all copies of the orders after reading them.

There were many examples of these orders being carried out with vigor. In March 1944 about 15 uniformed American soldiers were captured behind German lines in Italy and were all executed without a trial. In another incident about 15 British and American troops on a commando mission in Czechoslovakia were captured and sent the Mauthausen concentration camp to be executed.

Targeting Civilian Populations in World War II

The rapid development of technology during World War I made aviation a potent military tool. In the 1920s and 1930s military theorists—such

as General Giulio Douhet in Italy, Sir Hugh Trenchard in Britain, and General Billy Mitchell in the United States—proposed the use of bombers in a strategic role: bombers would destroy industrial targets and terrorize the enemy’s population, allowing for a quick and rapid victory without the need to deploy ground forces. Even though they must be placed in the wider context of strategic bombing, the examples of London, Dresden, and Tokyo illustrate the aims and effect sought by the belligerents as a policy of total war developed.

Early on in World War II, Germany bombed the Polish city of Warsaw—culminating in a massive raid on September 25, 1939—and the Dutch city of Rotterdam on May 14, 1940, albeit by mistake. The gradual escalation of violence and the belief in the virtue of strategic bombing—hitting industrial targets and annihilating the morale of the enemy’s population—made the targeting of cities appear justifiable during World War II. The bombing of cities and civilians also illustrates the shift toward total war, where civilian population and infrastructure are considered justifiable military targets.

In the wake of the battle for Britain, the German Luftwaffe (Air Force) launched its first major attack on London. In 12 hours, 625 airplanes bombed the British capital, killing 430 and setting off more than 2,000 fires. The bombing of London marked the starting point of an eight-

month campaign (September 7, 1940 to May 11, 1941) that also included other British cities. Known as the Blitz—from the word “blitzkrieg,” or lightning war—the objective of this campaign was to disorganize the British economy and to demoralize the population of London. Confronted with effective British defense, Germany quickly reverted to night bombing. Between September 1940 and May 1941 London received 100,000 high-explosive bombs and more than 1 million incendiary devices. The last night attack against London, on May 10–11, killed 1,436 people and severely wounded 1,742.

In spite of prewar prognostics stressing the vulnerability of large cities to aerial bombardment, the nature of the losses were less dramatic than anticipated: up to 3,000 dead and around 12,000 wounded per raid. What remained most striking to the British population was the disproportion between material damage and human loss. Even though more than one million homes were damaged by the Blitz on London, civilian morale never really faltered, and the population displayed remarkable courage and stoicism, the catch phrase being “London can take it.”

Britain mobilized considerable technological and industrial resources in its strategic bombing campaign against Axis targets. In fact, this effort mobilized the same level of industrial resources as that required by the British ground forces. Original objectives were German industrial and economic targets, but antiaircraft defenses over German cities as well as the bombers’ lack of precision forced the British to resort to nighttime area bombing. As such, bombers would aim and bomb a general area of a city instead of trying to bomb a particular target. By the end of 1944, British Bomber Command devoted large numbers of airplanes to its strategic bombing campaign and attained a respectable degree of precision. In 1945 the British Air Ministry prepared a plan calling for the bombing of major cities in eastern Germany. The objective was twofold: to help Soviet ground forces and to disrupt the flow of refugees fleeing the advance of Soviet forces.

On the night of February 13, 1945, British Bomber Command sent 805 aircrafts over Dresden, dropping 1,478 tons of high-explosive bombs and 1,182 tons of incendiary bombs. The following day, 311 American planes also bombed

► STRATEGIC BOMBINGS IN WORLD WAR II

The concept and use of strategic bombing proved controversial early on, and the moral debates over bombing civilians arose early in World War II. While at first the British and French limited their actions to dropping propaganda leaflets on Germany, after Germany reverted to bombing civilians in Warsaw and Rotterdam the Allies also accepted the concept of bombing cities and thus civilians. Overall, Allied strategic bombing in Europe followed three distinct phases. First, from 1940 to 1942, strategic bombing was ineffective and mainly served to display the British resolve to maintain the struggle against Germany. Second, from 1943 to the spring of 1944, British and American strategic bombing had limited impact on German industrial output, but it compelled Ger-

many to reorganize its industrial infrastructure and devote important military resources to the defense of the Reich. Finally, from the spring of 1944 to the end of the war in Europe, strategic bombing came of age, and perfected aiming techniques and air superiority brought devastation to German cities. It is in this context that the bombings of Dresden and Tokyo must be understood. Although some historians criticize the moral value of bombing civilians, going so far as to accuse Allied leaders of war crimes, it must be remembered that it was part of the global struggle against Nazi Germany. In the end, however, World War II brought about a new age in warfare, an age where the distinction between civilians and combatants vanished.

—Martin Laberge

the city. Having been spared thus far from major raids, Dresden was weakly defended. The raid created a firestorm whereby many fires coalesced to form a gigantic one, creating hurricane-force winds and temperatures of up to 800°C. In all, around 50,000 people lost their lives in the bombing.

The United States also pursued a policy of strategic bombing against Axis targets. The American bombing of Japan started in June 1944 after the required islands in the Pacific from which to launch bombers toward the Japanese mainland were secured. Once again, the objective was to damage civilian morale and to destroy the Japanese industrial and economic infrastructures. Strong winds at high altitudes and the presence of Japanese fighter planes impeded early American attempts at precision bombing. The chosen solution was to bomb Japanese cities at night at low altitude using incendiary bombs to ignite the wooden structures that made up most Japanese cities. On the nights of March 9–10, 1945, approximately 300 American bombers dropped 2,000 tons of incendiary bombs on Tokyo. The flames created by the multiple fires joined, as in Dres-

den, to form a massive firestorm. In all, almost a quarter of the city was destroyed, and around 85,000 Japanese were killed.

Although strategic bombing campaigns were designed to destroy industrial infrastructure and shake civilian morale, their results were mitigated by the fact that targeting cities and civilian population did not really impede industrial production or destroy civilian morale, except in the devastation of Japan. Theories of total war aside, it was the bombing of specific targets—oil factories or transportation infrastructure—that made strategic bombing a valuable military tool.

Thought and Religion

The first half of the twentieth century was an age of secularization. During this period, traditional worldviews competed with new worldviews based on scientific and technological advances. Just as scientific truths and a basic understanding of time, space, energy, and matter had been revolutionized by Albert Einstein's theory of relativity and the development of quantum mechanics, a vaguely formed worldview that rejected inherited truths and hierarchies emerged under the rubric of "modernism." Particularly in the West, popular interest crystallized around the new physics as well as the long-standing theories of Karl Marx, Charles Darwin, and the more recent theories of Sigmund Freud. Combined, their reasoning suggested that the drive to fulfill biological and economic imperatives explained the social order and human nature more fully than explanations that depended upon the existence of a divine cosmic order. Traditional world religions—notably Christianity, Islam, Buddhism, and Hinduism—remained crucial to the cultural characteristics of all the world's regions; however, adherents needed to either resist or absorb the cosmological challenge that science posed.

During this same period, secular ideological movements such as socialism, anarcho-syndicalism, nationalism, and anti-Semitism, among others, developed into near religious worldviews offering utopian promise. In this sense, these movements offered to re-create the shattered cosmological order. The increasing amount of information diffused through new media such as mass-circulation newspapers, radio, and film and the accelerated modernization of the developed world allowed for these ideological movements to promise their adherents a perfect world, devoid of economic hardships or of undesirables deemed sources of social breakdown.

The first decade of the twentieth century was a time of simmering tensions. The United States was just months past a territorial war with Spain. Japan was beginning to flex muscles and extend dominance. The Boer War and the Maji Maji Rebellion erupted in Africa. Nationalistic ideology, influenced by romantic mythology, was inspiring the birth of modern fascism in some areas and a hope for independence in others. At the same time, hopes of economic equity and better living conditions were inspiring dreams of a "workers' paradise." Ideas were not only competing but were inspiring people to organize and take action. Tensions and skirmishes in Asia increased as the dying Chinese dragon—marked by the fall of the Qing dynasty—lost its hegemonic position; war in Europe was largely the result of growing competition for colonial resources, nationalism, and the fear that gave birth to the

complex Alliance System. As these circumstances unfolded, people in societies around the world met in coffeehouses, tearooms, bars, and living rooms and debated the ideology of the day. Asian intellectuals were pouring over Georg W. F. Hegel, Karl Marx, John Stuart Mill, Herbert Spencer, and Charles Darwin. Europeans were looking for a “new order” to replace worn-out ideas and were finding a heady brew of romance and science.

Traditional worldviews and world religions competed with other forces for the attention of newly developing mass societies via new information technologies. Promoters of fascism and socialism relied on the new media to broadcast their message, replete with its own religious rhetoric and promises of a new heaven on earth. At the same time, efforts to harness technology to provide a traditional religious message could be seen in the birth of religious radio broadcasting in this period. In Britain, the Reverend John A. Mayo began Christmas Eve broadcasts in 1922. In the United States, the charismatic evangelical preacher Aimee Semple McPherson began radio broadcasts of her Four-square Church services to a wide audience in 1924.

Curiously, even scientists and engineers believed that they needed to fashion an image of science that could captivate their audiences and illustrate that a scientific viewpoint was worthy of reverence as the

engine of progress. Science promotion—perhaps better termed “scientism”—in the hands of early science fiction editors, scientists themselves, and corporate promoters offered a cosmos as saturated with meaning as any of traditional religions. Science was a utopian force, a new source of miracles, stability, and plenty. Presentations of “miraculous” technology were common in corporate electricity exhibits at world’s fairs since the 1890s. In the

Science promotion—perhaps better termed “scientism”—in the hands of early science fiction editors, scientists themselves, and corporate promoters offered a cosmos as saturated with meaning as any of traditional religions.

1930s in the United States, the National Research Council, an organization founded by Woodrow Wilson in 1916 to promote scientific research for national defense, brought together scientists to design the science exhibits and promote the impending 1933 world’s fair, “The Chicago Century of Progress Exposition.” Part of their efforts included the production of 30 15-minute radio broadcasts that highlighted the wonders of science. Plans to name the fair’s central exhibition arena “The Temple of Science” were reconsidered, and it was simply called the “Hall of Science,” with a central mural that depicted the Tree of Knowledge in the Garden of Eden as a source of good. At the same time, Christian evangelists from the Moody Bible Institute in Chicago began to mount shows of scientific wonders that reconnected similar wonder-evoking phenomena (for example, images of a lecturer on a transformer with sparks shooting from his hands) to a religious worldview. As in previous eras, images of science and technology veered between utopian dreams and apocalyptic worries, both of which connected them to religious thought. The move to the apocalyptic became underlined with the development and use of the atomic bomb. During the Trinity atomic

bomb test, for example, physicist and Manhattan Project director J. Robert Oppenheimer turned to scripture and quoted the *Bhagavad-Gita* to declare, “Now I am become Death, the destroyer of worlds.”

Not all of modern thought relied on such grandiose utopianism or apocalypticism. A quieter tragic worldview, for example, had grounded the thought of Sigmund Freud, the founder of psychoanalysis. A physician concerned with treating mental illness, he believed that sanity meant living with life’s ambiguity. The cosmic canopy was indeed shattered, and an individual had to accept his or her own death and other limitations as inevitable. A good life required peeling away the layers of conditioning that papered over traumatic events and the trauma of living in a meaningless universe; nevertheless, basic human impulses could be destructive and should not be necessarily encouraged. However, Freud’s disciple, Carl Jung, attempted to reenchant what Freud had identified as the individual’s subconscious. Jung offered the possibility of a mystical awakening; an individual’s interplay with a world of mythical archetypes was not escapist folly but instead was a way to a sounder self-understanding and authenticity.

Theologians and philosophers in the West also grappled with the consequences of a shattered cosmic order. This was most dramatically underlined with the development of existentialism from the late nineteenth century through the mid-twentieth century. Religious thinkers such as Søren Kierkegaard and “antireligious” thinkers such as Friedrich Nietzsche pioneered existential thought, which rejected a notion of “essences” engrained in human nature, values, or institutions. All was provisional and unfinished. As existence preceded essence, the burden was on the individual to embrace freedom in the face of the absurd, make decisions, and take actions. The goal, as in Freudian psychoanalysis, was for the individual to come to “authenticity,” to face reality and reject blind conformity. This thought flowered in the philosophical and literary works of Jean-Paul Sartre and Albert Camus during and after World War II, a cataclysm that encouraged a tragic worldview. Christian and Jewish philosophers, including Martin Buber, Franz Rosenzweig, Paul Tillich, and Karl Jaspers, grappled with the demands of bringing religious thought into an existentialist framework.

Despite the tempting image of modernists knocking traditionalists out in a twentieth-century boxing match, traditional world religions remained important and largely intact in the quotidian existence of most of the world’s population.

From rural Tennessee in the United States to Hindu provinces of British India to Shinto temples in Japan, traditional social relationships and institutions remained important to individuals. Muslims throughout the Middle East, central Asia, and Southeast Asia remained adherents to their faith and traditional in their day-to-day routines, despite European penetration into their respective societies. Christian missionaries in Africa, China, and Asia continued to deliver the message of the Gospel.

Despite the tempting image of modernists knocking traditionalists out in a twentieth-century boxing match, traditional world religions remained important and largely intact in the quotidian existence of most of the world’s population.

Many traditional religions in Africa, despite the infusion of Christianity and Islam, retained their original belief systems or syncretic versions of these combined with Christian or Islamic elements. Likewise, in Asia, Christianity had made significant advances in myriad regions such as Korea but within the existing cultural framework. As such, world religions, as in other prior historical periods, were able to exist in a foreign cultural context, adapting to the new environment and absorbing and influencing social and political structures. Latin America, traditionally Catholic, had been shaped in its social and political structures in this manner for centuries, since the Spanish conquest.

If daily lives, particularly in rural regions, remained under the sway of traditional thought and religion, cosmopolitan political movements seized on the notion of “progress” and encouraged a change in entrenched thought. Political and intellectual developments in capital cities and industrial urban areas had affected rural areas in prior periods, but new transportation and communications technologies allowed for the proliferation of ideas at a far faster rate, particularly influencing young people who were far more receptive to new ideas than their elders. In this way in the rural regions of both the industrialized and colonized worlds, new ideologies circulated that painted modernization and industrialization as positive developments and the retention of traditional ideas as detrimental to the notion of progress, with progress in this world rather than the afterlife as the primary goal.

During the interwar period, secular-minded progressives, from socialists to nationalists to liberals, lambasted the traditional worldviews of the countryside and embraced ideological notions that promised economic and social stability of their respective nation-state. The Spanish Civil War was a primary example of the clash of traditional-minded religious conservatives against liberals, socialists, republicans, and anarchists. Fascism emerged as a political and social movement, which while imbued with progressive notions of modernization and secularism also sought to restore the authentic national past through the removal of cosmopolitan elites and the influence of international capitalism, which was demonized and portrayed as bacteria that poisoned the national soul.

On the extreme left of the spectrum, the Bolsheviks promised a secular atheist worker’s utopia that required the elimination of class enemies who threatened the ideological purity of the workers who propelled the movement. In contrast, National Socialism advocated for the restoration of German power and the removal of world Jewry, making anti-Semitism the primary ideological strain of the movement, while also advocating national vigor, militarization, and the infusion of National Socialism into all German institutions. Other fascist, socialist, and nationalist movements in Europe shared many of these beliefs, particularly disdain of capitalism and Jews, and often clashed with the existing government in power, which often held onto liberalism amid political and social tumult in places like France.

Much of the colonized world, from North Africa to Asia, was also affected by the diffusion of new ideological movements from abroad,

though only as it fit their own needs to remove European colonial authority and assume their own independent state, replete with national identity and institutions. Nationalist movements in Asia, Africa, and the Middle East adhered to notions of national identity and modernization although taking their traditional cultural context into consideration, making their version of nationalism unique. Recognizing that cultural traditions and folkways distinguished them from Europe and that modernization could be viewed as Westernization, these nationalists sought to appropriate only the positive aspects that would improve economic and social conditions while preserving their religions and social relationships.

The alliances that existed before World War I were reconstituted before World War II, although in the latter fear of the spread of Soviet communism made the United States and western Europe hesitant to oppose the ambitions of German, Italy, and Japan. The Soviet Comintern promised the colonized world its support against the decadent capitalist world as well as the threat of fascist aggression. Despite these movements the world over, traditional conservatives were wary of the potentiality of their own removal from power, even if it meant national autonomy from European hegemony. Societies feared each other's nationalism, with its veneer of modernization and progress, but treasured their own as virtuous, particularly when contrasted with "Godless Communism."

The radical ideological and political movements of the first half of the twentieth century developed their own symbols, liturgy, and cultish aspects, which were very similar to the characteristics of traditional religion. By donning uniforms and titles, mythologizing heroes and martyrs, preaching a Manichean struggle between the forces of Good and Evil, and rousing exuberant enthusiasm through public speeches and spectacles, National Socialists, communists, and socialists sought to create an atmosphere that syncretized the belief systems of the traditional-minded in their societies while galvanizing the true believers. Anarcho-syndicalists (anarchists in support of laborers or tradesmen) in the Spanish Civil War, German Waffen-SS columns on the eastern front and Japanese kamikaze pilots in World War II, and Soviet police (NKVD) requisitioning grain in the impoverished Ukrainian countryside all performed their duties in the belief that their cause was just and that their respective system was worth the sacrifice despite the bloodshed and their morally questionable actions. The perpetrators of the Holocaust were able to rationalize their actions on the basis of a perceived "greater good" as were the Japanese soldiers at Nanjing, enforcers of the Stalinist police state, and countless others, all acting in the name of race, emperor, and history, respectively. The unquestioning loyalty of people at every level to fervent belief systems was necessary to sustain social and political movements such as National Socialism and Marxism-Leninism (in its Stalinist variety in particular) to inflict such a devastating impact on their own societies and those they conquered.

■ Introduction: Nationalism as an Intellectual Current

Nationalism is the name by which we know the carefully nurtured loyalty that unites populations in support of the modern state and was probably the single essential intellectual development in the creation of the modern world. By the beginning of the twentieth century, European societies had organized their political and economic systems to such a degree that they were able to control most of the world's resources. Their ability to arouse the fierce loyalty of their populations allowed them to achieve unprecedented heights of mobilization and production to support imperialist ventures. Nationalism made modern imperialism possible; in reaction, dominated or threatened peoples developed their own brands of nationalism. European political and economic domination aroused resistance, inspiring people across the world to dedicate their lives and fortunes to further the interests of their own nascent states. Gathering force, nationalism reached a deadly maturity in the twentieth century when competition among European states sparked two deadly world wars, culminating in the end of European hegemony and the intensification of nationalism across the globe.

European nationalism and success in overseas adventures moved forward hand in hand. By 1800 as nationalism became a force in their political and economic activities, European states controlled about 35 percent of the world's land area (as opposed to 7 percent in 1500). In 1914 at the beginning of World War I, European states, or states populated by Europeans, controlled about 85 percent. There had been no major international wars in Europe after Napoleon's armies had been defeated, but the century between 1815 and 1914 could not be described as nonviolent. Indeed, there were only four years between Napoleon's defeat and 1901 during which European forces were not involved in major battles. Industrialized European states had not become more peaceful; they had pursued their national interests by launching outward.

One of the most effective ingredients of nationalism is the sense that a specific population is different from (and more worthy than) the

people against whom they define themselves. There is no reason to unify if there is no competitor against whom to unite. The mythology of nationalism—in an unfortunate corruption of Charles Darwin's theory of evolution—held that it was the nature of strong states to expand and conquer weak states and that it was necessary for the progress of humanity that they do so. There is an assumption of racial or ethnic superiority inherent in nationalism that manifests itself even in nations that consider themselves bound only by civic loyalties. Perhaps this was more glaring in the writings of the German Romanticists and their celebration of the masculine Teutonic virtues, but it was also alive and well in the other nations of the early twentieth century. Self-appointed intellectuals expended much time and effort trying to prove the “scientific” superiority of one group or another. The term “Eugenics” came into use to describe a “science,” the mission of which was to ensure the development of desirable human offspring. Between 1900 and 1945 Eugenics movements appeared in nearly every industrial society as the elites in each defined their group as inherently superior, the possessor of the most desirable human characteristics.

By 1900 nationalism had become strident and adversarial. Passionate nationalism became both a symptom and a cause of intense competition between states. Through political speeches, art, newspaper editorials and cartoons, popular music, and literature, competing societies often depicted each other as buffoons, deceivers, rabid animals, or vermin. The constantly reinforced perceptions of national interests made it possible for states to arouse support for industrialization, mobilize for war or defense, and launch large-scale ventures into international markets. The dominant European states were involved in increasingly dangerous and ever-shifting alliances with (or against) each other. Many of their leading political and military figures believed that war was inevitable and perhaps desirable. Nationalism in eastern Europe—shaped by the ambitions of the Ottoman, Russian, and Austrian empires—simmered. In 1914 a Serbian nationalist provided the spark that set off the first of two devastating

world wars when he assassinated the heir to the Habsburg throne of Austria-Hungary, Archduke Francis Ferdinand and his wife, Sophie.

Resistance to European imperialism, in turn, had awakened nationalist sentiments in societies around the globe. As the entries below illustrate, the forms of nationalism differed from society to society. Resistance to both formal and informal imperialism has been a part of the Latin American experience for almost four centuries, but until the late eighteenth and early twentieth centuries the sense of nationhood seemed less central than that of ethnic or class identity. Africans and members of the African diaspora began to form a common sense of identity for the first time as the Pan-African movement grew. The first Pan-African Conference was held in London in 1900. Asian nationalism emerged as a reaction to European incursions as well. The Indian National Congress was founded in 1885 to work with the British; during World War I, Indian Nationalists sensed Britain's vulnerability and began to demand autonomy. In China, European powers had been circling the declining Qing empire even before the humiliations of the Opium Wars. European states, joined by Japan, made incursions into China and eroded the authority of the existing government until it collapsed. China fell into a period of revolution and political chaos before emerging with a new political reality and a highly developed sense of national identity. By 1900 Japanese nationalism, with its stated goal of "Asia for Asians," set in motion some of the most powerful and dramatic events of the twentieth century.

The unifying power of nationalism propelled imperial forces and inspired nationalistic reactions among the peoples whom European powers had subdued or threatened. Societies united in resistance to imperialism, successfully employing the symbolism and mythology of nationalism to unite, inspire, and invigorate their own populations. The aggressive nationalism that fueled European imperialism launched a global reaction.

Nationalism in Africa

The Berlin Conference of 1884–1885 set off a scramble for Africa among European powers that resulted in the forced colonization of almost the entire continent by the early 1900s. Nationalist movements quickly arose, however, that would ultimately lead to colonialism's demise. Sometimes lasting decades, the struggles for independence involved many groups sharing common grievances against the colonial system and desires for human dignity and freedom.

Before discussing nationalism in Africa, it is important to understand how it was different from nationalism in Europe, from whose experience the term "nationalism" is based. When most European countries became nations in the nineteenth century, people within the territories involved shared, for the most part, a common culture, language, and history. They perceived themselves to be a nation and, on those grounds, sought self-determination and their own state. By contrast, in most of Africa colonialism had destroyed historical territories and states within which people had lived, and foreign rule replaced indigenous forms of governance. The colonies that became the independent countries of Africa were the artificial creations of conquest in which people of diverse languages, cultures, and religions typically shared little in common but their subjugation. The nationalist movements that arose in this context were not, therefore, representative of nations seeking self-determination; rather, the nationalists wanted independence and statehood in order to create nations.

▶ NNAMDI AZIKIWE (1904–1996)

(Bettmann/Corbis)

One of West Africa's most famous nationalist leaders was Nigeria's Nnamdi Azikiwe. Azikiwe was among the numerous talented Africans from the British colonies of Nigeria and the Gold Coast who attended U.S. colleges and universities in the 1920s. He studied at Lincoln University in Pennsylvania, Stores College in West Virginia, and the University of Pennsylvania.

The experiences of these American-educated students resulted in leaders who returned to their countries with less elitist attitudes than those of

their counterparts educated in British universities, who often felt that they were superior to other Africans. Azikiwe and his fellow graduates, by contrast, were able to identify and communicate with the masses of Africans. They were also impatient for change and quickly turned their education to nationalist activities once they returned home. Affectionately known as "Zik," Azikiwe returned to Nigeria in 1937 and started a leading nationalist newspaper, *The African Pilot*. He also joined a student group, the National Youth Movement (NYM), and in 1944 was a founder of the National Council of Nigeria and the Cameroons (NCNC), which became a mass political party. A Pan-Africanist, Azikiwe's dream was the eventual creation of a United States of Africa. At independence in 1960 Nnamdi Azikiwe became the first president of the new country of Nigeria, and in his long political career he was one of Nigeria's most respected statesmen.

—April Gordon

The main colonial powers in Africa were the British, French, Portuguese, Germans, and Belgians. Although each European country had different systems of ruling its colonies, there were some commonalities in how Africans were treated that led to growing discontent and eventual calls for independence. Typically, education, political rights, and economic opportunity for Africans were limited, and racist attitudes and the maltreatment of natives by whites were pervasive. Brutality and repression were used by Europeans to maintain control and to exploit African labor. Other abuses such as land expropriation, unjust taxes, forced labor, and conscription of African men to fight in the two world wars were further catalysts to local demands for change.

Although hardships were experienced in both rural and urban areas, it was in the urban areas that much of the nationalist activity was concentrated. Most of the leaders of nationalist movements were products of Western-style education, and they had adopted aspects of Western culture such as language, dress, and the Christian religion. Many held lower-level civil service

jobs or were small business owners and professionals. They viewed themselves as civilized by European standards but were frustrated by the discrimination they faced from whites. Some leaders were drawn from the trade unions that had developed due to foreign investment in mining and industry. Members of women's groups, such as market women, also became involved in anticolonial activities in response to the unpopular policies and ill-treatment of colonial officials or their African collaborators.

Before World War II, most nationalist demands were for reform of colonialism; however, after the war the call was increasingly for independence. One of the ideas that inspired nationalist movements was Pan-Africanism, which espoused the unity of all persons of African descent in the struggle against racism and imperialism. Some of Africa's most famous nationalist leaders—such as Kwame Nkrumah (Gold Coast), Nnamdi Azikiwe (Nigeria), and Kenneth Kaunda (Northern Rhodesia)—were exposed to Pan-Africanism during their education in the United States and worked to spread its ideals in British African colonies.

Experiences and hardships during World War II contributed to the radicalization of many groups. For instance, while serving overseas or in other colonies in Africa, African conscripts saw firsthand what conditions were like in other parts of the world, leading many to want change back home. While fighting alongside Europeans, they learned to use European military weapons, technology, and tactics that later would be effectively employed in colonies where armed struggle became necessary to gain independence. On the home front, ordinary working Africans grew resentful of the increased forced labor, inflation, and diversion of food and other production to the war effort, which further subjected the African poor to hardship. Strikes by the trade unions and other forms of protest increased among Africans in all walks of life, and the discontent of ordinary people made it easier for nationalist groups to seek common cause with the masses for independence once the war was over.

Colonialism was further and fatally discredited by the Western powers themselves when they drafted the Atlantic Charter in 1941. The Atlantic Charter, with its stated values of respect for the rights of all people to self-determination and sovereignty, was a foundation for the United Nations. The charter further stated that such rights should be restored to people who had been forcibly denied them. The effect of the Atlantic Charter on people all over the colonial world, including in Africa, was tremendous, giving powerful ideological justification for anticolonial struggles.

With its call for independence, African nationalism in action was mostly peaceful. Most groups opposed armed struggle, favoring instead Gandhian ideals of nonviolence. There were several reasons for this. For one thing, most Africans could recall how resistance to colonial rule had been crushed by Europeans in the past, and they understandably hoped to avoid such bloodshed. Also, most nationalist leaders were Westernized and felt an affinity for Europeans and their culture and values; therefore, they hoped to pursue their goals peacefully by appealing to those values. Lastly, nonviolence had been shown by Mahatma Gandhi and his followers to be successful in securing independence for India in 1947. This provided a model of peaceful change for other

liberation movements to emulate. Still, in some colonies such as Guinea-Bissau, Mozambique, Angola, Kenya, Southern Rhodesia, and South Africa, armed struggle was adopted when peaceful tactics were met with repression.

Regardless of how independence was pursued, between 1957 and 1994 the colonization of Africa ended. Africa's nationalists had succeeded in returning control of Africa to its own people once again.

Nationalism in Southern and Eastern Asia

In the early 1900s the British-run government of India ruled the entire subcontinent of southern Asia. The government confronted a growing nationalist movement, composed of both Muslims and Hindus who sought Britain's withdrawal and India's self-governance. During World War I, India supported the British empire's war effort, providing over 1 million troops and auxiliary workers to the Allied war effort in Europe and Asia. Indian nationalists, from both the Hindu-dominated Congress Party and the Muslim League, endorsed India's aid to Britain in the belief that the south Asian colony would be rewarded with early independence. Instead, British administrators extended wartime restrictions on the press and public assemblies into the postwar era, and police and military forces were used to quell nationalist threats.

Following the end of World War I, tensions within India continued to rise. In April 1919 in the city of Amritsar, a crowd celebrating a religious festival was fired upon by British-directed

troops, leaving 400 people dead and 1,200 wounded. After the Amritsar Massacre, most Indian nationalists abandoned all support for British rule. At the same time, tensions between the Hindu and Muslim communities within India escalated. Mahatma Gandhi, a London-trained Hindu lawyer, led nonviolent protests against British rule, the most provocative of which was the Quit India campaign during World War II, when India was again required to support Britain. Following Gandhi's lead, protesting Congress Party officials resigned rather than help Great Britain. Muslim League leader Mohammed Ali Jinnah forced London to agree to India's immediate transition to full independence as the price of Muslim India's wartime cooperation. Amid widespread postwar communal violence, Great Britain established a separate majority Muslim state, Pakistan, when India achieved independence in 1948.

Although it had never been fully colonized, by the turn of the twentieth century China had surrendered scores of special trading and legal privileges to Western powers. Popular Chinese nationalism thus first turned against the weak imperial Qing government that had granted so many concessions to the West. As a consequence of the weakness of the Qing and the efforts to overthrow the nonreformist government, China's dynastic government collapsed in 1911. Although the nationalist leader Sun Yatsen was widely admired, his Guomindang, or Nationalist Party, lacked military power. To preserve order, Sun resigned as president of the new Republic of China in 1912, with leadership passing to General Yuan Shikai, who unsuccessfully sought to become emperor. Chaos ensued, and China fractured into large regions, each run by powerful warlords.

China supported the Allies in World War I, although the nation was humiliated by postwar settlements when Japan was awarded all of Germany's special rights in China. Ignited by this insult, a new variety of nationalism swept China. Popular support shifted to the Guomindang, which after Sun's death in 1925 was led by military commander Jiang Jieshi (Chiang Kai-shek), and later to the Chinese Communist Party (CCP), led by theorist Mao Zedong (Mao Tse-tung) after 1934. Though the Nationalists and the Communists briefly were allied against war-

lord rule, their pact dissolved in 1927. Using this time to build a sophisticated military, the Communists attracted increasing nationalist support in both urban and rural areas. During a civil war that lasted for more than 20 years, the Nationalists and the Communists had brief periods of reluctant cooperation in their common struggles against the Japanese invaders. Eventually the Communists prevailed and founded the People's Republic of China in 1949. As a consequence, Jiang moved the Republic of China government from the mainland to Taiwan.

Japan's emergence as a global power in the early twentieth century was driven by a deep-seated nationalist movement that shaped governmental priorities, including accelerated industrial development, military modernization, and imperial expansion. In 1895 after a period of rapid socioeconomic change that mimicked Western technical and industrial development, Japan attacked and defeated China, forcing its weak dynastic leadership to cede control of Korea and the island of Formosa (Taiwan). Japan's successful absorption of Western technologies, its cultural homogeneity, and its centralized government unified with imperial tradition all underpinned its accelerated economic development and the growth of its army and navy. In 1905 Japan's forces shocked Europe by defeating Russia, home of the world's then-largest military. As a consequence of the war, Japan seized Russian assets in Manchuria. During World War I, Japan joined the Allies but did little fighting. Its nationalist politicians at the Versailles Conference arranged Japan's acquisition of German trading and territorial concessions in warlord-riddled China.

Quarrelsome parliamentary politics during the 1920s gave way to popular nationalism in the 1930s, strengthened by Japan's growing empire in eastern Asia. The Japanese Army invaded Manchuria in 1931, and military successes stoked state- and race-centered Japanese nationalism, which reflected traditional Japanese disdain for Chinese, Korean, and other Asian ethnic groups. During the 1930s military-backed politicians planned further expansion of Japan's empire, which would ensure access to oil, food, cheap labor, and other resources in short supply on Japan's crowded home islands. Japan launched armed attacks in 1937 in China and in late 1941

in U.S. and European territories in the Pacific and Southeast Asia. Intense nationalism, worship of Japan's Emperor Hirohito, and the boldly aggressive behavioral code of Bushido ("the way of the warrior") shaped Japanese policies, military activities, and the conduct of those who served in its huge military juggernaut, which occupied most of Asia between 1942 and late 1944. Propaganda, policing, and the emperor's presence ensured domestic cohesion, even as Allied forces cut Japan's maritime supply lines and liberated Japanese-occupied territories. Tokyo's hyper-nationalist government abruptly surrendered in 1945 following American nuclear weapons attacks on Japan's home islands. However, by challenging the Western powers, Japan had emboldened indigenous nationalists throughout Asia, where powerful anti-imperialist and decolonization movements took shape during the postwar period.

Nationalism in Latin America

Nationalism has been central to the political and economic development of Latin America. Nationalism emerged relatively early in the context of global history and is traced by most historians to the wars of independence at the beginning of the nineteenth century. However, Latin American nationalism has been a contested and problematic ideal, and the issue of precisely who was

to be included in nationalist visions has been the subject of debate and negotiation up to the present. Nationalist ideologies have varied widely according to political perspective and chronological period and have been strongly infused with ideas of race and gender. The formation and dissemination of nationalist ideas need to be explored from above at the level of elite discourse and state policy and from below in the sense of the spread of popular consciousness and must be clearly distinguished from the state-led enterprise of nation building.

Leaders of the movements for independence in Latin America first began to articulate ideas of nationalism and used the language of "nations" and "peoples" to advance their cause. However, implicit in these early nationalist ideas was a sense of ambivalence toward the nonwhite population and a fear of black and indigenous unrest. Elite leaders needed to appeal to the masses in order to obtain their support, yet they sought to leave the existing colonial structures of power and economic privilege unchallenged. These contradictory pressures remained at the heart of nationalist ideologies for at least the next century.

Following independence, nationalism became the ideology through which competing elite visions for development were played out. As the nineteenth century progressed, nationalist ideologies became increasingly infused with social Darwinism, which equated political and economic prosperity with the racial composition of a population. Imaginings of nationalism became more inclusive in the twentieth century through intellectual currents such as *indigenismo* and *mestizaje*, which sought to rethink the role of indigenous heritage in national identity. Indigenismo emphasized the power of the indigenous heritage and the achievements of Native Americans in the ancient past. Mestizaje glorified the cultural and biological fusion between indigenous and Spanish groups and lauded the *mestizo* as the ultimate embodiment of national values. The Mexican Revolution of 1910 was particularly influential in advancing these ideas. Government education minister José Vasconcelos wrote about the mestizo as the "cosmic race," the people of the future, while the murals of Diego Rivera depicted the glory of the Aztec

WOMEN AND NATIONALISM IN LATIN AMERICA

Ideas about women have been entwined into nationalist ideologies in Latin America in complex and multiple ways. The ideal of Republican Motherhood, which held that the ultimate patriotic honor for women was to give their sons to national military struggle, served to glorify women as the biological reproducers of the national collectivity. Mariana Grajales, the mother of Cuban Independence leader Antonio Maceo, lost 10 of her 11 sons to the independence struggle and embodies this ideal. Women's bodies have been used to symbolize the boundaries of national inclusion through racialized ideas about the relative honor and respectability of different groups. Women have served as active transmitters and producers of national culture in their roles as schoolteachers, artists, and writers. They have been important participants in national struggles, whether in the more traditional secondary capacity of message runners and nurses or as frontline guerrillas, as was the case in the Cuban and Nicaraguan revolutionary movements. Oftentimes, women have encoded the biological identities ascribed to them by nationalist ideologies into their participation in these struggles, as when Evita Perón famously referred to herself as the "mother of the Argentine nation."

—*Nicola Foote*

empire. The Brazilian counterpart was the state-sponsored idea of "Racial Democracy," which argued that because of the proliferation of race mixture, racism against Afro-Brazilians did not exist. However, while these currents included subaltern groups at the level of representation, there was little shift in the realities of political and economic experiences, and many scholars and activists have asserted that these nationalist mythologies served to obscure racial discrimination.

The rise of the political Left in the twentieth century further reshaped nationalism, and Leftist intellectuals and activists presented left-wing politics as inherently nationalistic in their struggle to liberate the region from oligarchic elites and imperialist interests. Leftist nationalism was inextricably entwined with anti-imperialism and struggled against the economic influence of the

United States. Leftist nationalism also sought to redistribute power among the lower classes. However, nationalism in the twentieth century was not the sole intellectual property of the Left. Right-wing nationalism also flourished, promising national security and the preservation of conservative values, and followed a very different economic agenda centered on foreign investment and privatization. The Populist movements of the mid-twentieth century borrowed elements from both Right and Left in using the language of nationalism to gain political support. While populist regimes typically brought only limited change in terms of practical hierarchies of power, they reshaped nationalist ideologies in a more inclusive manner in order to focus on the poor and dispossessed. The rise of Juan and Evita Perón in Argentina arguably represented the apogee of populist nationalism, and the rapturous fervor they generated among the urban working classes underscores the power of nationalism as a strategy for connecting with the popular classes. Other important populist regimes include those of Getúlio Vargas in Brazil and José María Velasco Ibarra in Ecuador. Economic nationalism was a central part of both populist and Leftist programs and focused on the nationalization of key resources such as oil fields, railroads, and mining enterprises as well as public services such as electricity and phone companies.

Competing nationalisms spilled over into war at various points. This could take the form of civil conflict between liberal and conservative visions, as seen most dramatically in Colombia during the War of the Thousand Days (1899–1902) and La Violencia (The Violence) of 1947–1953, in which at least 180,000 Colombians died. Alternatively, it could mean war between rival nations for access to resources. The most devastating nationalist conflict of the early twentieth century was the Chaco War (1932–1935) between Paraguay and Bolivia that was fought over a border region mistakenly thought to be rich in oil resources.

Gender has been central to nationalist formulations in Latin America. Citizenship has typically been associated with male characteristics and responsibilities, while women's domestic and family roles have been emphasized, particu-

larly motherhood, routinely asserted to be women's ultimate patriotic contribution.

Intellectuals have played a key role in the development of Latin American nationalism as an ideology. Contrasting visions for the nation have been articulated through the means of national identity essays, novels, poems, and artistic works. Academic disciplines have been important, and archaeological and anthropological knowledge in particular have been woven into the narrative of nationalism. The state has also taken leadership in the dissemination of nationalist ideas through public education programs and the creation of monuments and memorials. Nationalism has also been shaped from below, as seen most clearly in the relationship between popular culture and nationalist ideas, with food, sport, music, and clothing all used to express and negotiate national identities.

Nationalism in Europe

In the course of 200 years, nationalism evolved into a major force shaping the contours of modern European history. Beginning in eighteenth-century western Europe, nationalism emerged as a modernizing force and liberal impulse reflecting the rational ethos of the Enlightenment. Nationalism assumed a more exclusionary and racist tenor during the nineteenth century, generating reactionary ideologies. This exclusionary, belligerent, and reactionary brand of nationalism was, to a great extent, propounded by academic figures who invoked Darwinism in order to lend scientific legitimacy to their racial nationalism

and thereby perverted the once liberal and liberating aspects of liberal nationalism. This new brand of ethnic nationalism sought to define the nation in terms of ethnicity, which more often than not required some element of hereditary descent from previous generations. Membership in the nation, which includes shared culture and language, also depended on heredity. The state, in essence, derives its legitimacy from its status as a homeland, for this ethnic group and its sole *raison d'être* is the protection of that ethnic group and its culture against infiltration by others. This exclusionary and racial permutation of nationalism ultimately produced the cataclysmic events of the twentieth century: two world wars, unprecedented acts of genocide, and the eclipse of European power and global influence.

At the turn of the twentieth century, the dramatic rise in dogmatic nationalism among many East European countries then dominated by several empires, especially in the Balkan states of Serbia, Bosnia, Herzegovina, Romania, Bulgaria, and Montenegro, would ultimately ignite World War I. One of the most notable nationalist associations to appear at this time was the "Union or Death" better known as the Black Hand. In May 1911 ten men in Serbia formed this secret society. Their main objective was the creation, by means of violence, of a Greater Serbia. By 1914 there were around 2,500 members of the Black Hand. The group was mainly made up of junior army officers but also included lawyers, journalists, and university professors. One of this group's members, Gavrilo Princip, assassinated the Austrian archduke Franz Ferdinand and his wife, Sophia, on June 28, 1914, triggering World War I. The drumroll of approaching warfare reverberated throughout the continent as German, Austrian, British, Russian, and French citizens responded to the call and the romantic allure of national unity and patriotic fervor.

Yet despite the unimaginable carnage on the battlefields and the economic and social hardships suffered on the home front, the sense of national purpose and solidarity was only reinforced in the years between 1914 and 1918. When the guns at last fell silent at the eleventh hour of the eleventh day in the eleventh month of 1918, the fever pitch of nationalist passion did not wane. Defeat required answers. The vulnerability

of the great German war machine with its history of honor demanded explanations. The response for many Germans was to be found in a resurrected nineteenth-century “scientific” racial nationalism. The Jews were to blame, and the pure “German soul” had to be safeguarded from alien influences and further humiliation. Similarly, in France in the first decades of the twentieth century nationalistic and anti-Semitic organizations such as Action Française, founded in the era of the Dreyfus Affair, proliferated. Antidemocratic, antirepublican, and antiliberal groups such as Jeunesses Patriotes (1924), the Ligue des Croix-de-Feu (1927), and Solidarité Française (1933), fearing a decline in the image and destiny of France, invoked the canards of nineteenth-century extreme nationalist and racist instigators such as Edouard Drumont (1842–1917) and Maurice Barrès (1862–1923). With the assassination of Ernst vom Rath, a secretary in the German embassy in Paris by a Polish Jew in 1938, the anti-Semitic proponents of French nationalism had yet another basis for anti-Jewish rhetoric and pro-French advocacy.

Nationalism as an ideological phenomenon posited an important distinction between “civilization” and “culture.” Early twentieth-century authors such as Thomas Mann, Gerhard Hauptmann, Robert Musil, and Gabrielle D’Annunzio incorporated this dichotomy in their belletristic and political writings. These nationalist writers viewed “civilization” as the aggregate of ideas and traditions that had been inherited from the ancient world and from the ethos and doctrines of Christianity. Thus, they believed that civilization represented an external influence that was superimposed over the native cultures of Europe. “Culture” (*Kultur*), to the contrary, emerged from the everyday life of the people and was unique and specific to the nation. The notion of *Kultur* includes native speech, folklore, religious deviations, and idiosyncratic practices and exclusive ceremonial and ritual practices. Nationalists extolled the virtues of culture while deprecating the previously favored notion of civilization. The embedded passions of nationalism as defined by the concept of *Kultur* inevitably led to conflict in all parts of Europe as the popular nationalism of ethnic minorities clashed with state-led nationalism, as embodied

in *Kultur*. While religious beliefs enforced many forms of nationalism, by the twentieth century nationalism had become, in effect, a secular religion. The notion of a glorious past, or an imagined golden age along with a surrounding medium of cultural symbols, produced a quasi-religious aura to twentieth-century nationalism. Extreme nationalists endowed their patriotic zeal with a messianic fervor and believed themselves to be entrusted with a sacred mission.

It should be noted that not all nationalist ideologies specifically espoused racism. Fascism in Italy emphasized not racial but rather ideological notions of “purity.” Italy’s Benito Mussolini maintained that the nation represented the supreme good and that individual concerns and needs were secondary to those of the state. Nationalism, as conceived by the Italian dictator, demanded “Everything for the State, nothing outside the State, nothing against the State.” Similar early-twentieth-century conceptions of the state and its absolute integrity can be found in Francoist Spain as well.

Additionally, not all nationalist sentiment manifested itself in militancy and belligerence. In Poland under the leadership of Józef Piłsudski (1867–1935), the legacy of numerous failures to secure autonomy and independence was a concept of organic work, a program and agenda aimed at strengthening Poland’s economic and cultural resources and infrastructure as an alternative to military confrontation. Other nations whose military capabilities were insufficient likewise appropriated the Polish model of cultural and economic nationalism. Yet even within the context of Polish national revival, there were elements that rejected Piłsudski’s cultural nationalism in favor of an integral nationalism that proclaimed “Poland for the Polish” and displayed a profoundly anti-Semitic, anti-German, and anti-Ukrainian bias.

In Germany, from the end of the nineteenth century through World War II, biological race theory was grafted onto European nationalism. Every aspect of Nazi policy had as its focus and basis racial or ethnic nationalism. While such racist elements can be found in most nationalist movements, they are typically directed at other nations. In the case of Nazism these sentiments were directed toward minority communities within the

nation, most conspicuously at Jews, Gypsies (Roma/Sinti), and Poles. German nationalism, even prior to the Third Reich, was rooted in a notion of *Blutgefuehl*. Blutgefuehl embodied the “collective unconscious,” to use a Jungian term, and was manifest in the instinctual and transcendent bond with a primal past as evinced in a unique cultural tradition. This blood bond tied the individual with the nation and its imagined glorious past and projected future destiny. The consequences of this rabid racial doctrine was first to exclude those not of the same bloodline and, ultimately, to annihilate them.

After 1918 the victorious Allies, led by President Woodrow Wilson, championed the right of each nation to determine its own present and future. While predicated on the traditional definition of nationalism, this new nationalism was based, at least theoretically, on democratic principles. But practical impediments to establishing autonomous states based on common language, history, and culture—that is, single nationalities—precluded a successful realization of the Wilsonian dream in interwar Europe. It was unrealistic to relocate all displaced Germans through-

out the war-ravaged continent in Germany or all Poles in Poland. Ethnic minorities were a political reality in Europe and, as it turned out, a time bomb that would ignite a second world war just two decades later. While the stress on self-determination after World War I led to the creation of several nation-states, the determination of the former Central Powers to have their ethnic minorities returned led to calls from Sudetenland Germans in Czechoslovakia, for example, to demand repatriation with Germany.

■ Introduction: Socialism

Socialism, as a political ideology and as a social movement, can modestly be defined as one of the many social programs that originated during and after the French Revolution, emphasizing, first of all, equality among citizens of newly emerging nations. Attracting people of divergent temperaments, ranging from benevolent utopian charity donors to hard-line terrorist revolutionaries, socialism crystallized into three main branches by the end of the nineteenth century: anarchism, communism, and social democracy. Anarchism never managed to play a major role of the progressive Left (except during the Spanish Civil War), so it is easier to make a distinction just between moderate and radical socialists. In the aftermath of World War I, the socialist movement split into a moderate faction and a revolutionary faction, known as social

democrats and communists. This same division, although originating in Europe, affected socialist and progressive movements all over the world. In Russia the division was known as the Mensheviks (Social Democrats) and the Bolsheviks (Communists). In China the same division appeared between the Guomindang's left wing and the Communist Party of Mao Zedong.

At the beginning of the twentieth century, socialism's most important organization was the Second International, a world coalition of socialist and labor parties founded in 1889. The Second International, although a fairly successful organization worldwide, broke down over the issue of military funding before and during World War I. A majority of national parties broke with the traditional pacifism of the labor movements and voted in favor of supplemental war funds.

The socialists in Europe embraced, with more or less enthusiasm, the war efforts of their respective nations, leaving the more radical and anti-war elements in the minority. At the Zimmerwald Conference in 1915, the antiwar elements condemned the Second International as “traitors,” thus paving the way for a permanent division.

Due to the success of the October Revolution in Russia, the most influential socialist organization between 1919 and 1943 was the communist-dominated Third International (or the Comintern). The Social Democratic-dominated Second International lingered on and was revived only after World War II. Lenin came to power promising the end of the war, although while in power he often emphasized the misguided support for the “imperialist war” by fellow socialists in the West. In his “Imperialism, the Highest Stage of Capitalism,” Lenin laid down his position that workers have no lesser or greater enemies during a war between “imperialist powers,” and this stance dominated the newly founded Communist Third International. Communists participated in elections but expected and worked toward a revolution, often considering political parties on the Left even more dangerous than their opponents on the political Right.

After moderate socialists lost power in Germany’s Weimar Republic, the socialist movement was dominated by Josef Stalin from the late 1920s, when he consolidated his power in the USSR until his death in 1953. The successful creation of the first socialist state in the world added enormous prestige to its leaders, Lenin (during 1917–1924) and Stalin (during 1924–1953). In 1940 Stalin physically eliminated his main rival, Leon Trotsky, the founder of the Fourth International and an advocate of world revolution. Stalin argued that the USSR first needed to develop socialism internally and presented himself as a pragmatist who abandoned the dream of a world revolution, thereby gaining many political allies and sympathizers in the West and all over the world. His prestige was further enhanced by the Popular Front strategy in the 1930s, which called for the deferral of the “class struggle” and set as its first priority the fight against fascism and Nazism. This policy opened the doors of cooperation between the communists and other progressive groups. It also gave Stalin enormous

influence on the political Left and Center-Left. In reality, Stalin was a very pragmatic and shrewd politician who had no moral doubts even about cooperating with the Nazis when necessary, and his reputation as the giant of the antifascist struggle only increased after the heroic Soviet victories on the eastern front during World War II. It was only after Stalin’s death in 1953 that the socialist movement managed to shake off his legacy. The Socialist International managed to become the largest worldwide organization of socialist and labor parties, following the tradition of the Second International and not of the Soviet-controlled Comintern. Its first president was Morgan Philips, general secretary of the British Labour Party.

—*Alexander Mirkovic*

Socialism in China

The Chinese Communist Party (CCP) was formed in 1921, shaped by the 1919 May Fourth Movement and its two strands of nationalism and cultural renewal. Committed to a nationalist cause with communism as the chosen ideology to rid China of foreign domination and rule of the bourgeoisie—which in its view was cooperating with the imperialist exploiters—the CCP was to become the Guomindang party’s main foe and ally at different stages in the history of the Republic of China (1912–1949).

Sun Yatsen led the Guomindang with a Leftist ideology embodied in Sun’s Three Principles of nationalism, democracy, and socialism. After the formation of the CCP, the Communist International (Comintern) contacted the Guomindang and offered organizational, economic, and arms support. The Comintern’s goal was to combine forces, undermine the Guomindang, and then use it for the communist cause. Marxist theory insisted that revolutionaries instigate a bourgeois-democratic revolution as a first step and then a socialist revolution as a second step. The Soviet advisers urged the CCP to form a united front with the Guomindang, and in 1923 CCP members joined the Guomindang individually as the Bloc Within.

Sun died in 1925 and was succeeded by the anticommunist Jiang Jieshi (Chiang Chieh-shih

or Chiang Kai-shek). Two years later the Guomindang's left wing (under Wang Jingwei) set up a rival government in Wuhan. The struggle was eventually won by Chiang, thereby effectively eliminating the Guomindang's left wing. In the same year the united front with the CCP came to an end in a white terror against communists in China's urban areas. As a consequence, Chiang moved his government from Guangzhou to Nanjing in 1928.

The white terror forced the Communist Party leadership to move to the province of Jiangxi in 1933, where party member Mao Zedong (Mao Tse-tung) had set up a rural soviet two years earlier. Realizing that the time for a proletarian revolution was not yet ripe in China, the CCP adopted a rural strategy of mobilizing the peasantry and of taking the cities from the countryside with a people's army, the Red Army, the beginnings of which were formed in the Jiangxi soviet.

Chiang accordingly set out to destroy the Communist Party's rural bases. In 1934 he had almost completely encircled the CCP leadership in its Jiangxi soviet. However, the communists managed to escape and embark on the Long March to the province of Shaanxi, where the rural base area of Yan'an was set up in October 1935. It was during the Long March that Mao Zedong became the dominant political figure of the CCP.

In 1935 the Comintern decided to suspend the struggle against imperialism and instead fight fascism. This strategy, known as the Dimitrov line, was based on the theory that fascism appeared as capitalism in a state of crisis, embarking on an imperialist war to divide the world into imperialist spheres in order to overcome this crisis. In December 1936 Chiang was ready to attack the Yan'an base. However, he was captured (the Xi'an Incident) and only gained his freedom after agreeing to stop fighting the communists and to fight the Japanese instead. Japan had attacked China in the north in 1931 and set up the state of Manchukuo. In 1937 Japan launched full-scale war against China, and the Nanjing government relocated to Chongqing. The Xi'an Incident prompted the Second United Front against Japanese fascism in a strategy that proceeded from the Dimitrov line.

The two years that passed between the pronouncement of the Dimitrov line and the es-

tablishment of the Second United Front were filled by a conflict between the center of international communism in Moscow and the Chinese leadership. The conflict was between the anti-imperialists and the antifascists. Mao's conception of a united front consisted of an anti-imperial class alliance, encompassing all national elements, including the national bourgeoisie, directed against both the "imperialist lackey" Chiang and Japan. However, the Comintern's strategy of a national alliance included Chiang and the CCP united against Japanese fascism. The Comintern line was supported by the Returning Students, or the Twenty-Eight Bolsheviks, headed by Wang Ming, who had replaced Li Lisan as head of the CCP in 1930.

The Second United Front was terminated after Japan's surrender in 1945, and full civil war broke out within China. When the communists captured Beijing on October 1, 1949, Mao Zedong proclaimed the People's Republic of China. The Guomindang fled to Taiwan, where in December 1949 Jiang Jieshi declared Taipei to be the temporary capital of the Republic of China.

Socialism in Indochina

Despite the creation of the Dang cong san Dong Duong (Indochinese Communist Party, ICP) in 1930, socialism in Indochina was a Vietnamese affair. In 1925 Ho Chi Minh founded the first communist organization in French Indochina, the Viet Nam Thanh nien Cach mang Dong chi Hoi, or Thanh Nien Party. Thanh Nien was in fact formed in Guangzhou, China, where Ho Chi Minh was sent by the Communist International (Comintern, or Third International) as part of the Mikhail Borodin mission to China, from

where Vietnamese communists infiltrated Vietnam and organized communist cells. From the nationalist perspective, communism was seen as a means to free the country from colonialism, whereas the democratic countries of Europe and the United States, who denied their colonies the freedom they claimed for themselves, were seen as a sham. In 1927 following Jiang Jieshi's crackdown on communists, Ho Chi Minh together with the Borodin mission left for Moscow.

In 1927 members of Thanh Nien set up a rival organization in Vietnam, the Communist Party of Indochina (Dong Duong cong san dang, not to be confused with the 1930 ICP). In reaction, Thanh Nien no longer concealed its communist ideology and changed its name to An Nam cong san Dang (Communist Party of Annam). At the same time, the moderate Tan Viet Party, which operated in Cochin China, changed its name to Dong Duong cong san lien doan (Indochinese Communist Union). Thus, three Leftist parties were active in Vietnam, fighting France and each other. In January 1930 Ho Chi Minh merged the three parties into the Dang cong san Viet Nam (Vietnamese Communist Party). In October 1930, urged by the Comintern, its name was changed to Dang cong san Dong Duong (ICP) to allow for the participation of Laos and Cambodia. As opposed to what the name suggests, the ICP was almost exclusively composed of Vietnamese.

In 1935–1936 the ICP formed a Lao section or the Committee for Laos, the predecessor of the Neo Lao Issara (Free Lao Front, sometimes given as Naeo Lao Issara). However, active recruitment of Lao communists and the building of a party structure did not take place until the mid-1940s. A Cambodian party was not formed until 1951 in the form of the Kampuchean People's Revolutionary Party (KPRP). Between 1945 and 1949 the Vietnamese communists cooperated with the primarily noncommunist anti-French resistance in Cambodia, among them the Khmer Issarak, a diverse group with a communist component. In Laos the Vietminh cooperated with the Lao Issara, a diverse nationalist group led by the Lao elite. In February 1951 the ICP dismantled into three national parties: the Vietnam Workers' Party (Dang lao dong Viet Nam) and the above-mentioned KPRP and Neo

Lao Issara. The latter then formed the Resistance Government of the Lao Homeland, in short Pathet Lao (Lao Homeland).

In the late 1920s and early 1930s, understanding that the proletariat was too small to be a useful political force, the communists in Vietnam turned to organizing the peasantry and tried to exploit the explosive situation in rural northern Annam (Ha Tinh and Nghe An provinces) during the world economic crisis. In 1930 the peasantry there rose against the colonial administration. Throughout the country strikes occurred, and smaller uprisings happened in central Annam and Cochin China. After colonial forces had quelled the uprisings, the ICP created rural soviets in Nghe An province, which were quickly wiped out by colonial forces. By the end of 1931 the colonial administration had restored order in Tongkin and Annam. The center of resistance shifted to Cochin China. In Annam, meanwhile, the ICP took on a friendly outlook and promoted mutual assistance associations among peasants during the late 1930s. In Tongkin the ICP operated under the name of the Indochinese Democratic Front. Beginning in 1941 many peasants became members of the ICP or joined the Vietminh.

In 1936 following the Comintern's Dimitroff line of 1935, the ICP suspended class struggle and anti-imperialism in favor of a national front against fascism. This resulted in relaxed French control under the Popular Front under Léon Blum (1936–1938). However, the downfall of the Popular Front, the outbreak of the war in Europe, and the installation of the Vichy regime led to increased persecutions against communists. Eventually the communist resistance in Cochin China was crushed. In November 1940 a peasant uprising in the Mekong Delta was quelled and the network of the ICP in Cochin China destroyed.

The ICP managed to maintain its clandestine network in Tongkin and Annam. From 1941 it was used by the Vietminh (Viet Nam Doc Lap Dong Minh Hoi), which followed the antifascist line. The Vietminh was founded in 1941 by Ho Chi Minh separate from the ICP to avoid French attention of the Vietnamese communist refugee community in China's Guangxi province. The idea was to achieve independence from Japanese and French fascism with the help of China and the United States, with which the Soviet

Union was allied. Japan in the meantime had attacked Indochina but acknowledged French sovereignty over territory.

Increasing French resistance to the arrangement with Japan in Indochina led the Japanese to dissolve the French administration in the coup de force of March 9, 1945. In Vietnam Emperor Bao Dai was restored to full authority, checked by the Japanese military. In August 1945 Japan surrendered to the Allied Powers, creating political opportunities. The advancing Vietminh took over Tongkin, Cochin China, and Annam. Bao Dai abdicated, and on September 2, 1945, Ho Chi Minh declared independence. The resistance war that followed the French attempt to reassert sovereignty over Vietnam was settled at the Geneva Conference in 1954, at which Vietnam was partitioned in a communist north and a noncommunist south.

In Cambodia, Japan's coup de force resulted in Tokyo urging King Sihanouk, who had ascended the throne in 1941, to declare independence within the Greater East Asia Co-Prosperty Sphere. After the Japanese surrender in August 1945, Sihanouk declared full independence. In October an Allied force occupied Phnom Penh and entered into negotiations with Sihanouk. On January 7, 1946, an agreement was reached to grant Cambodia autonomy within the French Union, effectively re-creating the French protectorate over Cambodia. Cambodia became independent in 1954.

In Laos after the Japanese surrender, the Lao Issara managed with the help of the Vietminh to install a government, which was ousted by advancing French forces. Laos was granted autonomy within the French Union and gained full independence in 1954.

Socialism in Russia and the Soviet Union

The ideology of socialism, particularly two of its interpretations known as Leninism and Stalinism, served as the dominant political system in Russia and later the Soviet Union from late 1917 until the end of World War II in 1945. While a group of Russian revolutionaries used Russia’s disastrous experience in World War I and the hopes of a disaffected population to overturn the tsar, gain power, and establish their vision of socialism in late 1917, the history of socialism in Russia can be traced back decades earlier. During the second half of the nineteenth century a number of Russian thinkers and writers, such as Georgi Plekhanov (1856–1918), looked toward socialism as an alternative vision to the autocratic system of the Russian Empire, which was the status quo. Socialism, with its promises of social and economic equality, appealed most to Russia’s nonnoble educated classes. From within this

group came many socialists, not all of whom wished to bring revolution to Russia. One radical socialist, Vladimir I. Ulyanov (1870–1924), better known by the surname Lenin, came to dominate a faction of the Russian Social Democratic Labor Party in 1903. Lenin was the leader of a small revolutionary group known as the Bolsheviks, and he and his supporters promoted a doctrine of class struggle and proletarian revolution based primarily upon the earlier writings of Karl Marx (1818–1883) and Friedrich Engels (1820–1895) as well as Lenin’s own philosophy about the future of socialism in Russia.

Interestingly, the Bolsheviks were not directly involved in Russia’s first two revolutionary episodes of the twentieth century. The first of these events was a failed popular uprising against the regime of Tsar Nicholas II known as the Revolution of 1905. While Nicholas II failed to resolve the social and economic grievances that were the root causes of the revolt, Lenin did not believe that the time was yet right to begin a radical socialist revolution. Part of his rationale rested in the fact that he and some of his eventual supporters, particularly Leon Trotsky (1879–1940), believed that the path toward socialism in Russia should be somewhat different than that advocated by Marx. Instead of waiting for the inevitable arrival of socialism during the dying days of advanced capitalism as Marx had predicted, Lenin maintained that Russia could pass from its current state of feudalism into a brief, albeit painful, period of capitalism. Then, the Bolsheviks believed, they could use revolutionary activity to push Russia rapidly into the next stage—socialism—within a relatively short time. The events of World War I convinced Lenin that the time was ripe for action, although it would take the influence of non-Bolshevik forces in early 1917 to allow him to move.

The February Revolution of 1917, a popular movement in which the Bolsheviks played only a minor role, forced the abdication of Nicholas II. Later that year in the October Revolution the Bolshevik Party took control of Russia’s industrial and economic heartland. Once in power, Lenin’s Bolsheviks sought to implement their interpretation of Marxism, which came to be known as Marxism-Leninism, through the creation of a centralized one-party state that strongly pro-

moted atheism and internationalism, that is, the support of revolution worldwide.

While the Bolsheviks controlled Russia's central core, they still faced a potent opposition in the form of the whites, a loosely organized group of counterrevolutionaries who shared a common desire to restore the tsarist system and to remove the Bolsheviks from power. The resulting conflict, the Russian Civil War of 1918–1921, witnessed the Bolshevik implementation of a strictly centralized economic policy known as War Communism and the first use of widespread repression at the hands of the Bolsheviks, who viewed as a threat various religious groups, most notably Russian Orthodox believers, and a host of potentially divisive ethnic groups (e.g., Ukrainians and various peoples of the Caucasus and Central Asia) that had been previously incorporated into the tsarist state.

With the Bolshevik victory in the Civil War and the creation of the Soviet Union in 1922, Lenin turned away from War Communism and toward the New Economic Policy (NEP), which introduced elements of capitalism into the previously centralized economy of the Soviet Union. Although NEP never represented a wholesale adoption of free market economics, the early years of NEP did witness a loosening of economic strictures as well as a relaxation of social mores. With Lenin's death in January 1924, however, NEP began to lose momentum, and by the late 1920s the policy had become a target of attacks by more conservative elements within the Soviet government.

The leader of this conservative movement was Joseph V. Stalin (1879–1953), who in 1928 shifted from Lenin's and especially Trotsky's vision of worldwide revolution to a policy known as Socialism in One Country. Instead of devoting its resources to the overthrow of capitalist governments abroad, Stalin decreed that the Soviet Union would focus on rapid industrialization and the forced collectivization of agriculture at home through the implementation of a new economic model known as the Five-Year Plans.

By the early 1930s Stalin's reinterpretation of Marxism-Leninism, which many have termed Stalinism, emphasized the inclusion of previously disenfranchised social groups into the command-economic system that now dominated the Soviet

Russian revolutionary Leon Trotsky in 1920, the year he became Commissar of War and founded the Red Army. (The Illustrated London News)

Union. Along with industrialization and collectivization came a new and more widespread assault on the state's enemies, both perceived and real. Known collectively as the Great Purges or the Stalinist Terror, Soviet socialism took on a decidedly self-defensive tone as thousands of so-called class enemies were executed or sent into forced labor in the corrective labor camps. Nazi Germany's attack on the Soviet Union in 1941 forced Stalin to reenvision socialism. With the nation now at war, Stalin needed to curry favor not only with the functionaries of the Communist (Bolshevik) Party but also with other populations that had suffered during the Great Purges. Under Stalin's direction, the state reached out to members of the Russian Orthodox Church and to the Soviet Union's majority Slavic peoples. In a departure from Lenin's policies of atheism and internationalism, Stalin's regime promoted Russian Orthodox identification and Eastern Slavic

► VLADIMIR ILLYICH LENIN

Vladimir Lenin, the head of the revolutionary Bolsheviks and a leading theoretician of Russian communism, was one of the most influential leaders of the early twentieth century. Born Vladimir Ilyich Ulyanov on April 22, 1870, in Simbirsk, Russia, Lenin's views became extreme early on with the execution of his brother, Aleksandr, for subversive activity. In 1893 Lenin moved to St. Petersburg, where he became familiarized with the works of Karl Marx. Lenin wrote propaganda for the early socialist movements and was eventually arrested and served four years in jail before being exiled to Siberia. After receiving his freedom he moved around Europe, continuing to write propaganda advocating revolution. He returned to Russia in April 1917 after the February Revolution. His faction, the Bolsheviks, emphasized a highly motivated and disciplined revolutionary cadre and

believed in a rapid adaptation to capitalism before socialism was established. Lenin, with the support of the workers and the Petrograd fleet, launched a successful coup d'état against the provisional government. Lenin ceded a great deal of land to the Germans in order to win peace in the belief that global revolutions would soon make nations irrelevant. He then waged a bloody civil war against counterrevolutionaries from 1918 to 1921. After the civil war, Lenin allowed some minor capitalist concessions in nonindustrial enterprises in an effort to rebuild the ruined economy. He became ill in 1922 and died on January 21, 1924, acknowledging that he had left a huge and inefficient bureaucracy as well as divisive subordinates who were already fighting for power. His body is embalmed in a mausoleum in Red Square, where it is still visited by thousands.

(i.e., Russian) ethnicity as part of the state's drive to unify the country in the face of the Nazi onslaught. After the Soviet Union's eventual victory in World War II, however, Soviet-style socialism returned to its prewar conditions. The state, under Stalin's direction, again attacked organized religion, capitalism, and expressions of nationality that it deemed destructive to its ultimate socialist goal, the attainment of communism. According to Marxism-Leninism, this utopian final stage of historical development would witness the elimination of the need for private property, the beginning of communal ownership of all goods and services, and the achievement of complete equality among all people.

Socialism in Western Europe

Socialism is difficult to define because by 1900 it had branched into a number of new movements with different agendas. Widely defined, however, socialism teaches that the working class should own—or at least have partial ownership of—the means of production (i.e., the factories or places where workers work). While this is a predominantly working-class ideology, middle-class individuals have traditionally helped to develop the philosophy.

Socialism became more popular near the end of the nineteenth century as agitation for working-class men's suffrage became widespread. In addition, as workers tried to improve their working conditions, they often turned to socialist groups and formed trade unions. In time, strikes, boycotts, and other mass movements became common elements of working-class movements. At the turn of the twentieth century, European socialist movements generally fell under one of two categories: democratic socialism and Marxist socialism.

Democratic socialism became especially popular in Europe in the early twentieth century. This form of socialism combined the ideas of democratic government and socialist notions.

► GEORGE ORWELL ON SOCIALISM AND THE BRITISH WORKING CLASS

“For it must be remembered that a working man, so long as he remains a genuine working man, is seldom or never a Socialist in the complete, logically consistent sense. Very likely he votes Labour or even Communist if he gets the chance, but his conception of Socialism is quite different from that of the book-trained Socialist higher up. To the ordinary working man, the sort you would meet in any pub on a Saturday night, Socialism does not mean much more than better wages and shorter hours and nobody bossing you about. To the more revolutionary type, the type who is a hunger-marcher and is blacklisted by employers, the word is a rallying cry against the forces of oppression, a vague threat of future violence. But, so far as my experience goes, no genuine working man grasps the deeper implications of Socialism. Often, in my opinion, he is a truer Socialist than the orthodox Marxist, because he does remember, what the other so often forgets, that Socialism means justice and common decency. But what he does not grasp is that Socialism cannot

*British novelist George Orwell, a socialist who wrote about working conditions in books such as *Down and Out in London and Paris* (1933) and *The Road to Wigan Pier* (1937). After fighting with the Trotskyites in the Spanish Civil War, Orwell began to critique totalitarian regimes. (Bettmann/Corbis)*

be narrowed down to mere economic justice and that a reform of that magnitude is bound to work immense changes in our civilization and way of life.”

—Alexander M. Zukas

Source

George Orwell, *The Road to Wigan Pier* (1937; New York: Penguin Books, 1979), 154–155.

By making political participation accessible to the people and providing the people with candidates who actually had a chance of getting elected, democratic socialism turned itself into a mass movement rather than just a theory or a radical fringe group. The middle class played important roles in democratic socialism, especially as leaders of the movements.

The other predominant form of socialism in Europe during this era was Marxist socialism. Marxists and democratic socialists disagreed on a number of things, most especially about the idea of revolution. Marxists expected full-scale revolution and a redistribution of property, while democratic socialists desired to achieve their ends not through violent revolution but rather through elections, as Britain's Labour Party did in 1918. At the same time, while democratic socialists had a strong middle-class following, Marxists did not believe that the bourgeoisie could possibly become integrated into their program. This latter fact was especially true if the

Marxist leaders were able to achieve their goal of a classless society. Central and East European states generally favored Marxist socialist groups, while West Europeans tended to turn to democratic socialist movements.

For socialists to have an impact upon politics in western Europe, it became necessary for them to set aside their differences and unite to create political parties. In France the need for unity caused evolutionary socialists and French Marxists to unify under the tent of the Section Française de l'Internationale Ouvrière (French Section of the Workers' International, SFIO). Britain's various socialist groups, including Fabians and the Marxist Social Democratic Federation, united under the umbrella organization known as the Labour Party in 1906. Even with these efforts, socialists for the most part did not gain power until after World War I, when economic hardship struck many West European states.

In Great Britain, economic crisis in the interwar period led to election of Britain's first Labour

government in 1924, led by Ramsay MacDonald. However, the Labour government only passed limited welfare legislation and soon lost power again. To add to other economic crises in Britain, the nation was greatly damaged by America's stock market crash in 1929 and the Great Depression that followed. Britain had borrowed a great deal of money from the United States during World War I, and the United States now expected the European nation to pay it back. In the end Britain's economy continued to fail, and only the creation of the national government in 1931 brought about any type of recovery. Unfor-

tunately, World War II would once again destroy the British economy, leading to the election of another Labour government at the war's end.

■ Introduction: Traditionalism versus Modernism

By the twentieth century, the West looked less to tradition and the past for guidance, and increasingly toward innovation and the future. Premised on the sanctity of the individual and the empowerment of human civilization through science, reason, and creativity, modernism coincided with the rise of civil society—a value-neutral arena in which to conduct the practical affairs of business, education, government, and public life generally. The civil sphere depended on pluralistic openness and deliberation. Each group must have a voice to represent its interests, and each individual must be free to make choices and accept personal responsibility.

In Europe, tradition had governed conceptions of social order and institutions since the Middle Ages, based on loyalty to established monarchies, class and status privileges, and social roles based on gender, race, religion, and other customs. In traditionalism, life is a set of obligations, not a series of choices held according to established precepts of political, economic, and social orders.

In World War I (1914–1918), “Old World” traditionalism clashed with modernism. Monarchies in Germany, Austria, and the Ottoman empire fought against the democracies of France, Great Britain, and, later, the United States. Although siding with the Allies, Russia's monarchy collapsed

in 1917 and the allied victory ensured the demise of the monarchies. Although the dynastic empires disappeared, traditionalism continued in other forms. Even in the United States, which lacked a feudal and dynastic period, established and wealthy families still held considerable power and retained considerable privileges in social and political circles. Still, their power and influence was not primarily based in tradition; they had to compete with other players and prove their relevance in a democratic system.

In the United States, traditionalism was more typically associated with religious values. In 1909, Cyrus I. Scofield published the *Scofield Reference Bible*, which contains copious commentary from the author. His particular interpretation of Scripture formed the literary basis of the movement in Christianity now called fundamentalism. Revised in 1917, the text inspired many traditionalist leaders, such as Billy Sunday (1862–1935) who preached that modern highly individualistic society lacked moral structure and that rampant immorality and corruption would destroy the nation. His boisterous style and relentless eschatological doom and damnation became the model for evangelical preachers for decades afterward.

Thus, the first half of the twentieth century saw the emergence of two basic worldviews. On one side, modernism looked forward, and prom-

ised constant change and progress. It offered individual choices for everything from career to consumer goods to morality. Mass education, free thought, and equal opportunity would empower individuals. However, existential uncertainty and psychological insecurity were suggested by commentators to be the price for a free and open society.

In contrast, traditionalism promised a clear moral framework and clearly defined social roles, most often along gender lines, but sometimes along the social construct of race. Religion rather than science and reason would guide society, especially in education, lifestyle, and government. This offered a greater sense of certainty but inhibited freedom and innovation.

In the United States, religion often played a vital role in modernism as well as traditionalism. For example, in the 1920s, two very different movements, the Ku Klux Klan and the Progressive movement, both gained their greatest size and influence. The Klan attempted to restore the racial and religious order of the antebellum South. The U.S. Progressive movement promoted a social agenda based on the inherent rights and dignity of the individual, which, therefore, necessitated struggles against poverty, as well as struggles in support of labor and civil rights, including the right of women to vote, achieved in 1920. Secularists, such as John Dewey (1859–1952), called for a broadly active populace committed to social development and participatory democracy, and progressive ministers, such as Walter Rauschenbusch (1861–1918), joined Christianity with socialism in order to promote social improvement for all.

In 1925, the State of Tennessee put high school biology teacher John Scopes on trial for teaching evolution, which was illegal in Tennessee. Known as the Scopes Monkey Trial, Scopes' guilt was never in doubt. Rather, both sides made the trial a national forum for the battle between science and religion. Not a biblical literalist, William Jennings Bryan (1860–1925), representing the religious side, instead feared that evolution would usher in a new era of scientific totalitarianism based on biological essentialism. On the side of science, Clarence Darrow (1857–1938)—working for the American Civil Liberties Union (ACLU)—argued that schools must teach the

truth, and science only becomes sinister when people apply it that way. He noted also that religion can be equally positive or destructive. Far from resolved, these issues remain salient in the United States today.

In Europe, fascism emerged in Italy after World War I. It attempted to revive the mythical traditions of the Roman Empire, especially its patrimonial relations of political authority under the new-day emperor Benito Mussolini (1883–1945), known as “*Il Duce*” (the Leader). As fascism spread to Germany in the 1930s, Adolf Hitler (1889–1945) similarly became the Leader, *Der Führer*. His leadership, based significantly on a mystical vision of Germany's traditional past, inspired a new barbarism that murdered about 12 million people in concentration camps, forced marches, mass shootings, and systematic starvation (including millions of Jews), and ignited World War II (1939–1945), a conflict that caused the deaths of about 20 million soldiers and 40 million civilians. Modernism and traditionalism once again clashed in the form of free societies on one side and obligatory totalitarianism on the other, which also included another society steeped in traditionalism—Imperial Japan. It should be noted that, although the Soviet Union ultimately joined the allies, their totalitarian system originally allied with Nazi Germany against Finland, Poland, and other independent states. Based on modern principles of rational management, the Soviet Union relied far less on tradition and mysticism and far more on direct terror and oppression, especially under Josef Stalin, who ruled from 1922 into 1953.

Allied victory in World War II seemingly vindicated the free and democratic societies of the West, and the notion that modernism, despite its problems, offered a far more humane and beneficial vision than those that envisioned the restoration of traditional hierarchies, privilege, or totalitarian socialism. Later in the twentieth century, progressive modernism would open the door to civil rights, antiwar movements, countercultures, women's emancipation, and environmental movements. Progressive Modernism also facilitated tremendous creativity and innovation in art, music, literature, science, industry, and commerce.

Traditionalism and Modernism in Africa

In the first half of the twentieth century, when more than 90 percent of the continent of Africa was under European colonial rule, Africans and their colonizers frequently debated their values and religious beliefs in terms of tradition and modernity. The question was not only whether or not Africans should modernize their beliefs and practices but also which beliefs and practices—African indigenous, colonial, Islamic, or Christian—were traditional and which were modern. In this period of drastic transformation,

Members of the Presbyterian Church pose in front of their banner for the “Stranger Mission” in Liberia, about 1900. (Corbis)

Africans searched for an identity that offered the most meaning to their life under colonialism.

Nineteenth-century events formed the backbone of this twentieth-century debate. While there were many indigenous religions in Africa, most shared a belief in a god or gods, spirits, the continued relevance of ancestors, a fear of witchcraft, and the power of healers. A majority of Africans followed these indigenous religions; however, Islam was the most widespread religion in precolonial Africa, and it was most prevalent in North and West Africa and along the Swahili coast of East Africa.

The nineteenth century saw both a series of Islamic reform movements and the spread of Christianity as a number of European missionaries came to Africa with a civilizing mission. The most well known of these was David Livingstone, a Scottish missionary-explorer in Africa from the 1840s to the 1870s. The three Cs—Christianity, commerce, and civilization—that Livingstone advocated for Africa summarized the missionaries’ efforts to spread the word of God, replace the slave trade with legitimate commerce, and rid Africa of its savage customs.

By 1900 most of the continent was under European colonial rule, and with the establishment of colonial rule came the gradual expansion of Christianity. For example, in Kenya where a minuscule number of converts were reported in 1900, Christians represented 8 percent of the population by 1938. Those attracted to the mission stations were mainly disadvantaged members of society: former slaves or slave descendants, women, and young men. At the missions, these groups found access to status and wealth denied to them at home. Missionaries encouraged converts to give up certain African customs and conform to life on the mission station, which included adherence to a new daily schedule, attendance at mission school and church, dressing in Western clothing (which covered private areas of the body), and commitment to a monogamous marriage. In Kenya in 1929 missionaries encouraged the colonial government to ban female circumcision, a necessary ritual for a Kikuyu girl’s entry into womanhood. As a result, a large number of Kikuyu Christians broke away from the missions to form their own independent churches and schools.

By the 1920s mission and colonial schools resulted in the emergence of a class of educated elites, many of whom worked as clerks in the colonial governments. As more young men and women left their villages to live at the missions and in urban areas in search of employment, chiefs and elders back home complained that they were losing control of their community's youths. Both officials and chiefs became concerned about detribalization, the removal of Africans from their traditional communities and lifestyles. British administrations established a policy of indirect rule in the early 1920s to address this problem. Britain established Local Native Councils, Native Tribunals, and a system of appointed chiefs to rule Africans based on customary law. This resulted in the codification of customs that, in the precolonial period, were less rigidly defined. Historians such as Terence Ranger argue that this resulted in the "invention of tradition" as part of a divide-and-rule colonial tactic.

French administrations, however, encouraged assimilation, urging Africans to give up their language, culture, and beliefs to become Frenchmen. The promise was French citizenship, although only the residents of the early urban settlements of Dakar, St. Louis, Gorée and Rufisque (in modern-day Senegal), and a few colonial-educated French-speaking Africans actually saw this promise fulfilled. All other Africans in French territories remained subjects, not citizens.

Meanwhile, Islam continued to flourish. The greatest increase in the number of Muslims in sub-Saharan Africa occurred during the colonial period, in part as resistance to colonial domination. Islam was strongest in urban centers, which often resulted in the perpetuation of the association of Islam with modernity in the face of rural traditions. As Islamic modernist movements spread south and west out of Egypt in the early decades of the twentieth century, more Muslims obtained a secular education in spite of the association, whether perceived or actual, of colonial schools with Christianity. Many Muslims established their own schools or implemented modernist curricula in existing schools such as the Al-Azhar University in Egypt. In North Africa, Islamic modernists embodied anti-colonial sentiment, sparking protests in the 1950s,

➤ AHMADU BAMBA

The Muridiyya movement of Senegal represents the new forms that Islam took hold of in the face of colonial expansion. Ahmadu Bamba (ca. 1850–1927), a marabout from the Kingdom of Boal in Senegal, established the Muridiyya movement in the 1880s as part of the Qadiriyya tradition, the oldest Sufi brotherhood. Bamba, an Islamic teacher and scholar, developed a following at a time when the French were in the final stages of defeating jihadist attacks challenging their expansion in West Africa. Bamba gained popularity in regions on the margins of French control, raising fears of a new jihad. The French arrested and exiled him, first to Gabon (1895–1902) and then to Mauritania (1903–1907). In an effort to avoid an exodus of valuable Muridiyya farmers to Mauritania, the French allowed Bamba to return to Senegal, where he remained under strict surveillance until 1912. Bamba's letters to his followers praising French efforts in Senegal convinced the colonial rulers that he would not dissent. Collaboration between Bamba and the French resulted in the expansion of both peanut farming and the Muridiyya movement eastward along the railway lines. By the time Senegal gained independence in 1960, Mourids represented 20 percent of the population and controlled about 25 percent of the peanut production.

—Corrie Decker

whereas East African Islamic modernists, such as the sultan of Zanzibar, collaborated with colonial officials.

Religious pluralism, the coexistence of different religious beliefs and practices, and syncretism (the combination of different beliefs and practices in one religion) characterized most African cultures of the colonial period. The Mumbo cult of the Luhya near Lake Victoria, which experienced a strong revival during the 1920s and 1930s, was an indigenous religion that incorporated a number of biblical symbols and stories. The *aladura* movement beginning in the 1920s among the Yoruba in Nigeria combined Christian practices with local beliefs about witchcraft. Spirit cults such as the *bori* of Nigeria, the *zar* of Sudan, and the *pepo* among the Swahili in East Africa, which spread during

the colonial period, were based on a mixture of African and Islamic beliefs and practices.

Colonial debates over the values of African traditions and European modernity, whether in terms of culture or belief, characterized the first half of the twentieth century and remained the terms on which the values of colonialism itself was measured. The coexistence and/or overlap of indigenous and colonial cultures, African cosmologies, Islam, and Christianity, all of which have their own histories of tradition, was itself the marker of modernity.

Traditionalism versus Modernism in East Asia

At the turn of the twentieth century, East Asia was undergoing changes that would have major lasting effects on both the public and private lives of nearly everyone in the region. China was on the brink of the 1911 Republican Revolution and the fall of the Qing dynasty, Korea's 518-year Joseon dynasty was drawing to a close, and Japan had just opened its ports to foreigners after more than two centuries of near-complete isolationism. The underlying current of these changes taking place in East Asia was that of modernization and a rising interest in becoming more integrated with the outside world. Throughout the long dynastic periods that preceded the 1900s, many rich traditions flourished, and these traditions tended to clash severely with the efforts to-

ward modernization that occurred throughout East Asia in the early twentieth century.

Modernization is a concept that is frequently conflated with Westernization, and the history of East Asia helps in part to explain why this is so. While China, Korea, and Japan had remained relatively closed and isolated countries prior to 1900, a growing interest both by and about foreign (especially Western) nations led to increased contact between the West and East Asia by the mid-nineteenth century. This meant that certain modes of production, technologies, and sociocultural values from the West were suddenly juxtaposed with Chinese, Korean, and Japanese traditions that in many cases had gone more or less untouched and unchallenged for centuries. However, while increased contact with the West may have helped to prompt these East Asian nations to make major changes, it is important to keep in mind that the modernization occurring in East Asia in the early twentieth century was not simply the East trying to emulate or catch up with the West.

There were many debates and attempts to make sense of the dramatic changes that were taking place at that time. For example, the slogan "Wakon Yosai" (Japanese spirit, Western learning) became popular in Japan. In China, a similar slogan was adopted, "ti-yong," that was the abbreviation of a slogan meaning "Chinese learning at the essence, Western learning for practical development." These slogans were reassuring to many who were concerned that their philosophical and moral values were at risk of fading away as foreign people and ideas began permeating their society. They also show that in spite of the fact that modernization and Westernization were indeed taking place concurrently throughout East Asia, there was a clear distinction made between the two in the minds of many Chinese and Japanese.

Moreover, the changes that came with the modernization of East Asia at the turn of the twentieth century were far from uniform throughout the region. Within nations, there were huge discrepancies between rural and urban areas, with the urban centers tending to change at a much faster rate than the countryside. Among China, Korea, and Japan there were large discrepancies as well, with many citing Ja-

MAJOR EVENTS IN EAST ASIAN MODERNIZATION, 1900–1945

While the process of modernization took place in East Asia over a number of centuries, the period from 1900 to 1945 marked a particularly accelerated period of transformation. In the decades leading up to the twentieth century, several events prompted major change in East Asia. The 1868 Meiji Restoration set Japan on a path toward modernization in a social, economic, and political sense. The 1894–1895 Tonghak Peasant Revolution in Korea, in which a guerrilla army composed primarily of farmers attempted to overthrow the government, set off a chain of events that would ultimately bring the Joseon dynasty to an end in 1910. Prompted in part by the Tonghak rebellions, the Sino-Japanese War of 1894–1895 highlighted how successful modernization efforts had already been in Japan when the Japanese came out victorious against China and began their territorial expansion across Asia.

The timeline here highlights key moments in East Asian history during the first half of the twentieth century. Many of these events were directly related to modernization and the increase in contact between nations that was taking place at that time.

1900	Boxer Rebellion in China
1904–1905	Russo-Japanese War
1910	Japanese annexation of Korea
1911	Revolution in China
1912	Abdication of the last Chinese emperor
1915	Japan's Twenty-One Demands to China
1923	Great Kanto Earthquake in Japan
1931	Japan seizes Manchuria
1934–1935	Communists conduct the Long March in China
1937	Second Sino-Japanese War begins
1937	Nanking Massacre
1941	United States initiates an oil embargo on Japan
1945	Atomic bombs dropped on Hiroshima and Nagasaki
1945	Japan surrenders, and World War II concludes

—Robin Kietlinski

pan's late-nineteenth-century Meiji Restoration as a resounding success and China's period of self-strengthening as an overall failure. While this would be putting it too simply, there were measures taken during Japan's Meiji Restoration that rapidly propelled the country toward modernization in an economic, industrial, and social sense, while in China, civil wars and general turmoil in the early twentieth century made it nearly impossible for the desired self-strengthening to reach its full potential.

For example, from the end of the nineteenth century and into the early twentieth century, the Japanese government made great efforts to strengthen the nation through various campaigns centered on politics, education, and the economy. In addition to the "Japanese spirit, Western learning" slogan, popular catchphrases such as "fukoku kyohei" ("rich country, strong army"), "oitsuke, oikose" ("catch up, overtake"), and "bunmei kaika" ("civilization and enlightenment") embodied the successful campaigns that were being

carried out to build up the nation's military and to educate the masses. The Sino-Japanese War of 1894–1895 and the Russo-Japanese War of 1904–1905, both of which were won by Japan against their much larger neighbors, added fuel to the rising tide of militarism and imperialism that was building in Japan. The state-led crusades toward national strengthening did not come about without opposition, however, as the new modern way of life often did not blend well with the traditional values and lifestyles of the Japanese.

Japan's strict Confucian-based hierarchical *shi-no-ko-sho* ("warrior-peasant-artisan-merchant") class system was gradually phased out at the end of the nineteenth century. This completely threw Japan's social order into flux, as the samurai class suddenly wielded little power, and the previously lowly merchant class began to rise in status as Japan moved away from a barter economy into a more commercial system. Another form of social reformation included a push toward universal education,

which meant that the opportunities for young women began to expand beyond traditional household duties. This was of great concern to those who had lived by Confucian codes of conduct, which emphasized filial piety and the general subordination of women. Rapid and drastic changes were also seen as vast sums of government money were allocated for the development of Japan's railway system. As trains and other forms of transportation such as rickshaws, horse-drawn carriages, and steamboats became more widespread, the movement of people and goods became much quicker and less expensive.

While political, economic, and social campaigns had been well coordinated and successful in Japan, such campaigns in China wound up falling flat in the face of factional infighting and the absence of a widely shared national ambition. For example, in the early 1900s the Chinese government sought to expand the nation's economic base by developing state-supervised companies, but individual entrepreneurs were simultaneously seeking private wealth, and the two endeavors wound up undermining each other. There was an effort to modernize and improve the nation's military, but it proved extremely difficult to unite forces that once had loyal followings to competing factions prior to 1900. Overall, while the state had managed to wield tremendous organizational power in the Japanese context, the tension between centralized and localized power in China made efforts toward modernization in the early twentieth century enormously challenging.

In this period, there were many hurdles to overcome as the East Asian region transitioned from being relatively isolated and inward-facing to being part of the global community. This modernization cut across all segments of society in the early 1900s, from the fundamental alteration of military and legal structures to the reformation of educational systems and social hierarchies. Oftentimes there were clashes between old and new, and in the case of China some of these clashes delayed processes of modernization. Japan, on the other hand, seemed to embrace the *Wakon Yosai* ideology, using Western learning and technology to help the nation transition rapidly into the modern era while

maintaining a Japanese spirit by incorporating old traditions and ways of life into the new.

Traditionalism versus Modernism in Europe

The clash between traditionalism and modernism in Europe during the first four decades of the twentieth century led to dynamic political, social, economic, and intellectual changes. The rapid industrialization and urbanization—which characterized the first half of the twentieth century—in tandem with its embrace of scientific knowledge, rationality, and technology and coupled with the two global conflagrations that engulfed much of the European continent did much to spur this contentious struggle. The three major political ideologies of fascism, communism, and liberalism, in confronting the social and political chaos of the interwar period, the global economic depression, and the two world wars, promised a new world to masses desperate for stability. Traditionalism offered a return to the hallowed past of the Belle Époque, with its Victorian purity, Christian values, and rural simplicity, while modernism offered a new social order with its basis in egalitarianism, economic prosperity, and urban excitement.

Following the collapse of the old European order at the end of World War I (1914–1918), the political forces unleashed upon the European continent promised hope and the restoration of order. Britain, France, Germany, Italy, the countries of the former Habsburg domains, and the Soviet Union were all profoundly affected by the rapid changes brought to their societies by

the war. Liberalism, the political ideology that had promised reform and democracy to Europe, was increasingly seen as impotent and decadent in the interwar period. Fervent nationalism, economic protectionism, and resentment against the new order created at Versailles in 1919 profoundly set the stage for the contrasting popularity of fascism and communism, each of which attracted scores of disillusioned veterans and restless youths.

Traditionalism, as displayed in the surge of reactionary conservative and fascist movements, had a significant influence on the political ideologies of the interwar period. For example, German National Socialism, Italian fascism, and Spanish monarchism (both Alfonsine and Carlist) promised the restoration of older values and institutions, which were the bastion of these nations' stability. Family, religion, and rural prosperity were to be the bulwark against the decadence of the cities, industrialization, and the urban masses. In the political and economic chaos of the interwar period, fascist and nationalist reactionaries embraced imagined pasts of provincial prosperity, hearty peasants, and pious Christianity as the means of fighting the perceived decadence of liberalism and the specter of communism. German conservative parties, Italian monarchists, and Spanish rightists found common cause with the fascists, seeing them as vital allies in their struggle against the forces of modernization. Anti-Americanism, along with anti-Semitism, became prevalent among traditionalists, as the United States and its consumer culture (in the form of department stores and mass merchandising), jazz music, and so-called soulless capitalism were seen as poisonous to long-standing traditional European values. Ironically, as reactionary as these fringe rightist movements purported to be, they utilized new technologies (loud speakers, film, radio, advertising, and so forth) to get their message across while also pandering to the interests of disgruntled urban dwellers who sought social and economic stability from whoever promised it.

In another example of such hybridization, the Futurists, such as Italian writer Filippo Tommaso Marinetti, embraced fascism, which they saw as a vehicle for progress and dynamism rather than as a reactionary force of traditional-

➤ NATIONAL SOCIALISM AND MODERNITY

National Socialism in Germany pitted itself ideologically against the purported forces of modernization, which allegedly came in different nefarious forms. According to Adolf Hitler's autobiography and political manifesto, *Mein Kampf*, American capitalism (in the form of department stores), Russian Bolshevism, European Jewry, and decadent liberalism were all threats to the German people and the purity of their traditional values and racial stock. However, the German Third Reich displayed various characteristics that were the very essence of modernity. Indeed, the National Socialist Party-state, prevalent from 1933 to 1945, used technology, economic planning, communications, the regimentation of daily life, and mass advertising in order to attack the forces of decadence. The very tools of global capitalism were usurped by the Nazis for the benefit of the German people, as were other facets of the dreaded specter of modernity.

—Abraham O. Mendoza

ism. Similarly, in Germany, many scientists, intellectuals, and medical doctors viewed National Socialism as a driving force of modernization for Germany and not as a bastion of Prussian reactionaries.

The end of World War I brought wide-eyed optimism to much of the European Left in light of the success of the Russian Revolution of 1917 and the dissolution of the remaining Old Regime European empires. While liberalism festered, socialism and communism imbued many social classes with hope for the future. Interwar Weimar Germany, Third Republic France, and the Spanish Republic, among other national governments, had significant socialist majorities in their legislatures, proving that the will of the masses had been heard loud and clear. Rapid industrialization and urbanization were problems to be addressed by the expansion of the welfare state for the purposes of the distribution of wealth and the social security of the citizenry. Furthermore, the arts, architecture, and culture, imbued with modernist themes, carried with them both beauty and functionality (e.g., the

Bauhaus School) to be enjoyed by all of society, not just elites. As a case in point, Weimar Germany became the bastion of European art, literature, architecture, and theater, having thrown off the shackles of the Prussian militarism of the prewar period. Across Europe, communist and socialist parties, sharing a social milieu with many artists and intellectuals, became the intellectual paradigm of the era, with both not only promising drastic political and social changes in the new postwar world but also offering new venues for intellectual development and academic discourse (e.g., the Frankfurt School). In particular, in Weimar Germany many artists, writers, actors, and playwrights, such as Bertolt Brecht and Walter Benjamin, met and shared ideas with socialists, communists, and other political activists.

World War II (1939–1945) was the culmination of the struggle between the forces of modernism and those of traditionalism. Advocates of traditionalism, which had surrendered to the dynamic nationalist and fascist forces of revisionism, had inadvertently become accomplices to ideologies that advocated radical social and political changes with the mere trappings of restoring the past. In contrast, the forces of modernization were unleashed as most all European countries again mobilized for total war, requiring the requisitioning of troops, national wealth and resources, and technological advances. The rapid modernization of war, in addition to the revitalization of liberal democracy in confronting the immediate dangers of war, restored the will of the West in quashing the revisionist fascist powers. The Soviet Union, the bastion of world communism, was a vital ally in the destruction of the German Third Reich and its reactionary allies while also legitimizing their variant of socialism to the world as a means toward modernizing and creating a new society free of the constraints of global capitalism. With the end of the war in 1945, traditionalism survived the onslaught of war to undergo different guises during the Cold War, pitted in resistance against communism and the advocates of social justice (e.g., feminism, gay rights, abortion) in the liberal West.

Traditionalism versus Modernism in the Americas

Similar to developments in Europe during the first half of the twentieth century, the conflict between traditionalism and modernism in the Americas reflected fundamental changes that both inspired and frightened people. Industrialization, urbanization, immigration, scientific and technological advancements, new currents of thought, and changes in the arts that were transplanted from Europe in the nineteenth century led to dramatic changes in conservative worldviews particularly in urban areas. These changes in turn led to reactions on the part of tradition-minded inhabitants against what they saw as a threat to their established worldview.

Changes in the arts and literature in the early twentieth century reflected the social changes that accompanied modernization. The culture wars between the dynamic “new America” of the cities and the more traditional and religious-minded rural areas exemplified this paradigm shift. Younger generations, shaped by a burgeoning consumer culture and drawn by jazz, dancing, and urban possibilities sought to abandon the repressive moral codes of their parents and sought a more exciting life. In Latin America, shaken by political revolutions and dramatic social and economic changes particularly in the interwar period, the gap between cosmopolitan urban areas and conservative rural areas became even wider. Major cities, such as Mexico City and Buenos Aires, became cultural centers with more in common with Paris and New York than their own outlying rural areas.

In the United States and Canada, rapid cultural changes from 1900 to 1945 created a so-

► SCOPES MONKEY TRIAL

Perhaps the most well-known incident regarding the conflict between traditionalism and modernism in the United States is the Scopes Monkey Trial of 1925 in Dayton, Tennessee. In 1925 the State of Tennessee passed the Butler Act, which stipulated that public schools could not teach the theory of evolution as the basis of human origins. As a result, the American Civil Liberties Union (ACLU) arranged for a high school biology teacher, John Scopes, to intentionally violate the act by teaching about evolution. The subsequent trial, which turned into a national controversy, pitted ACLU lawyer Clarence Darrow, representing Scopes, against famed statesman William Jennings Bryan, who represented the state prosecution. Both sides used authorities in both the scientific and religious communities to support their claims, ultimately turning the entire trial into a circus. By pitting literal interpretations of Scripture against existing scientific paradigms and vice versa, both sides sought to discredit the other. Ultimately, Scopes was found guilty and fined \$100. However, the trial represented the existing conflict between rural traditionalism and urban modernism in the context of 1920s America.

—Abraham O. Mendoza

Dr. John Neal with John Scopes (right), made famous by the Scopes Monkey Trial of 1925. (Library of Congress)

phisticated modern urban culture associated with theater, art, film, and other means of entertainment, which traditionalists deemed decadent. Traditionalists associated major cities with immigrants, crime, alcohol, communism, and moral decay, thereby igniting a series of reactionary movements in many rural areas. In the United States, the resurgence of the Ku Klux Klan in rural areas and the conservative Protestant-based movement that led to the Eighteenth Amendment (1919) that outlawed alcohol were two major examples of the rural conservative backlash against modernity. Nonetheless, Prohibition encouraged a widespread illegal drinking subculture supported by bootlegging, organized crime, speakeasies, and jazz culture celebrated by many in the United States. U.S. au-

thors such as F. Scott Fitzgerald and Henry Miller wrote about the tumultuous lives of those who took part in this interwar urban society, looking at the new bohemians who were disgusted with traditional society and sought to embrace the freedoms of the jazz age. At the same time, authors such as Sherwood Anderson described in his collection *Winesburg, Ohio* (1919), a small American town full of repressed people with stunted lives. Meanwhile, advertisements and periodicals hyped the “new woman” of this period, with her bobbed hair and liberated attitude toward drink and relationships, which also threatened traditional conceptions of hearth and home. While some rural areas, particularly in the U.S. South, sought to lessen the damage of this perceived debauchery by reverting to more

conservative Christianity, the onset of modern culture percolated across the country.

In Latin America, developments similar to those occurring in Anglophone North America did take place, albeit on a more regional basis. Major cities with more exposure to European contact, such as Mexico City, Buenos Aires, and Rio de Janeiro, developed as major cultural centers that embraced modernist culture. These more cosmopolitan urban areas were worlds apart from rural areas, with their stricter religious- and patron-based political relationships. The power and influence of the Catholic Church throughout much of Latin America still shaped popular disfavor of the immorality of the new cosmopolitan modernist culture. Fears of how urban values might affect families, women, and religious belief were taken very seriously by traditionalists. Rural people, while significantly affected by the growing industrialization of their respective countries, still largely observed traditional hierarchical relationships between villagers and local elites. While the expansion of extractive industries focused on raw materials or energy production did bring social change to rural areas, traditional values did not change considerably in comparison with that of urban areas. Young people in major cities in Latin America shared in the consumerism and appreciation for high culture of that of their North American and European peers, given their access to such activities based on wealth and education. While exposure to Euro-

pean cultural forms, primarily those emanating from Spain and France, had a significant impact on urban youths, the development of local high culture was also quite influential during this period. Important artwork by creative minds such as Diego Rivera and Frieda Kahlo illustrated the development of such cultural forms. Literature by authors such as Pablo Neruda and Jorge Luis Borges also exemplified native contributions to this shift. The urban poor were attracted either to the same values as that of their rural compatriots or the more radical political ideas emanating from Europe, such as communism and fascism. In the midst of the Great Depression and the world wars, such political ideologies had a definite impact on all segments of society. However, political ideologies such as that of Peronism in Argentina and one-party rule in Mexico under the Partido Revolucionario Institucional (Institutional Revolutionary Party) are examples of political organizations embracing modernization while preserving the trappings of traditionalism.

■ Introduction: Religion

The first half of the twentieth century was a time of vivid contrasts. On the one hand, the secularism of the European Enlightenment seriously undermined the credibility of religion. States such as the Soviet Union were openly hostile to religion and officially promoted atheism. On the other hand, there was a religious revival, a reaction against modernism and secularization, that could be called fundamentalism for the sake of brevity. Fundamentalist movements profess strict adherence to ancient princi-

ples and are generally accompanied by a belief in scriptural inerrancy. Although adherents often think of their religious organization as eternal and unchanging, all worldviews are shaped in part by the societies in which they exist.

In the nineteenth century, Christianity in particular underwent a phase of self-examination of its own tradition called “higher criticism,” and many mainstream churches embraced liberal theology. The main principle of liberal theology (which actually culminated in the Christian ecu-

➤ KARL BARTH

Karl Barth, considered the leading Protestant theologian of the twentieth century, rejected liberal theology, emphasizing the radical dichotomy between God and human nature. Leaving behind traditional views that called for a synthesis between church and culture, Barth focused on the supernatural and eschatological aspects of Christianity.

Barth began his professional career as a liberal and active supporter of his college professors' teachings. His first job was writing and editing for the leading liberal theological journal *Die Christliche Welt* in Marburg, after which he accepted his first position as a pastor in Geneva from 1909 to 1911. Between 1911 and 1921 Barth became pastor of a small church in the village of Safenwil, where he earned the nickname "The Red Pastor" for his socialist politics and support in organizing the underpaid textile workers in the village. He began to question his acceptance of Liberal Protestantism when he saw the world's economic inequalities. Similar to what happened with many other leading theologians and social thinkers, World War I destroyed Barth's optimistic view of a world where there was always progress because of mankind's innate good as well as his faith in Liberal Protestantism.

Barth and a neighboring pastor, Edward Thurneysen, began to question and criticize their professors' theology. From these discussions Barth published his first book in 1919, *Epistles to the Romans*, that contained his first rejection of Liberal Protestantism. Barth returned to a view of God as all-powerful and all-knowing. He rejected the nineteenth-century humanist view of God and mankind and believed that the nineteenth century had placed too much emphasis on the goodness of mankind and that there needed to be a greater recognition of mankind's sinful nature. Barth's book created a major theological debate in Europe and was severely criticized by his professors and colleagues in Liberal Protestantism.

Barth wrote a second book in 1927, *Christian Dogmatics in Outline*. In 1932 he began his multi-volume examination of church doctrine, *Church Dogmatics*. His fifth volume, *The Doctrine of Reconciliation*, was unfinished when he died. Barth became one of the most outspoken opponents of the Nazi regime as it began to dominate both government and church, and he vigorously urged Christians in Europe and the United States to fight against Adolf Hitler. After the war Barth encouraged people not to hate the German people and advocated for their political freedom.

—Jose Valente

menical movement) was that traditional Christian theology is not in conflict with a modern secular-scientific worldview. This moderate idea lost much support in the early part of the twentieth century as religious people took sides. Some moved into indifference toward religion, some moved into agnosticism or atheism, and others moved in the opposite direction and reasserted the religious fundamentals and their primacy over secular and humanistic principles.

The relationship between nationalism and religion was also very dynamic during this period. The global religious revival was a complex phenomenon, often influenced by factors that were not strictly religious. Religious movements, such as the *Kokugaku* revival of Shinto in imperial Japan, African Ethiopian and Zionist churches, British and American Fundamentalism, and Middle Eastern Islamism, could also be considered

nationalist movements in religious garb. What these movements had in common was the idea of the return to the original purity of religion as it once existed in a premodern period. Once these fundamentals are found in the past, they are then applied to the problems of the modern national state. Thus, Kokugaku sought to eliminate Buddhist and Confucian influences on Shinto, and Ethiopian churches emphasized the fact that Africa had direct links with many biblical figures long before the arrival of European colonial missionaries. British and American Fundamentalists sought a return to the idealized pure Anglo-Saxon Protestantism that once was the "shining city on a hill," and Islam desired a return to the glory days of the Arabic caliphate when Islam was pure and there was no humiliating occupation by the imperialists and infidels. All these revivalist or fundamentalist groups idealized their groups'

unity in the historical past in order to achieve the unity in thought and deed that, they believed, was lacking in modern secular societies.

Religious practices of the early twentieth century reflected the emerging global world and were quite syncretistic. For example, beginning with the early twentieth century there was a vivid interest in Asian religions, such as Buddhism, in Western intellectual circles. Thinkers such as Friedrich Nietzsche and Carl Jung were substantially influenced by their study of Asian religions. Theosophy, one of the most popular occult groups of the turn of the century, was deeply influenced by Asian religious thought (and in turn encouraged the revival of Hinduism in colonial South Asia). Hermann Hesse's novel based on the life of the Buddha, *Siddhartha* (1922), was one of the great best-sellers of continental Europe. The journeys that Daisetsu Teitaro Suzuki undertook in the 1920s and 1930s in order to present Japanese Zen to Western audiences also had considerable influence on artistic and intellectual circles. However, only time will tell if this was just a trend of the early half of the twentieth century or if it will have more substantial consequences on the religious map of the world.

—Alexander Mirkovic

Diasporic African Religions

Diasporic African religions, faiths that originated in Africa and spread throughout the western hemisphere via the slave trade, had taken on forms distinct from both their African antecedents and Christianity by the early twentieth century. These new faiths would deeply influence the society and culture of blacks throughout the New World. At the same time that these religions were taking their more-or-less permanent forms, they were also coming to the attention of whites, who typically stereotyped them as mere magic or devil worship.

Several such religions existed by the turn of the twentieth century, including Brazilian Candomblé, Bahamian Obeah, and Trinidadian Shango, even though scholars and popular authors alike have tended to focus most of their

attention on Cuban Santería and Haitian Vodou. Santería is sometimes known as Lucumi, a Cuban term for the Yoruba and related ethnic groups whose beliefs formed the foundation of the faith. The word “Santería” refers to the syncretistic nature of the religion, which identifies major gods or spirits with Catholic saints who possess similar attributes. In addition to Catholicism, elements of Native American beliefs, Kardecian Spiritism, and other African religions helped shape Santería.

At the heart of the Santería faith is service to the *orishas*, spirits originating among the Yoruba of present-day Nigeria. Some of the most prominent are Shango, a deity of thunder, lightning, and fire; Yemaya, goddess of the sea and mother of the world; and Ellegua, messenger of the orisha. These beings communicate with humans through various forms of divination and sometimes possession of devotees during ceremonies. Other spiritual forces in Santería include ancestral spirits, a supreme being known as Olodumare, and a force, called Ashe, that suffuses the entire cosmos.

Haitian Vodou shares many features in common with Santería, the most notable being its multiple deities. Similarly, it is also a syncretistic religion that has incorporated elements of Catholicism, including the identification of spirits with particular saints, Native American beliefs, and European spiritualism. One major difference between Santería and Vodou is the point of origin. While Santería is overwhelmingly Yoruba, Vodou was more strongly influenced by the religion of the former kingdom of Dahomey, now known as Benin. Yoruba elements still feature prominently, however, as do those of the Kongo people.

As with Santería, Haitians accept the existence of a supreme being who is distant from his creation. Likewise, lesser spirits are more important to everyday life. In Haiti these beings are known as *lwa*. Believers divide them into several nations, including the Rada (from Arada or Alada, a Dahomean city) and Kongo pantheons, which reflect their African places of origin. One nation, known as the Petwo, may have developed in Haiti itself during its struggle for independence in the late eighteenth and early nineteenth centuries. Followers of the faith honor the spirits in communal and familial rituals, which typically

include spirit possession. Many also rely on the lwa to work magic and foretell the future.

To the north, the United States was also experiencing developments in its own brands of Creole faiths, the most prominent of which was Voodoo. It was most strongly associated with New Orleans, Louisiana, although it was a presence in many areas along the Mississippi River and its tributaries. In nineteenth-century New Orleans a succession of priestesses, known as queens, had presided over major ceremonies and had been important leaders in the black community. Like other African diasporic religions, it also had its own pantheon of deities. By the first few decades of the 1900s, most outsiders determined that the faith had degenerated into magic, losing its distinctive deities and large-scale rituals as it was abandoned by increasingly educated African Americans. The fact that large numbers of shops catering to blacks' magical needs had developed in New Orleans and elsewhere seemed to bear out this conclusion.

Voodoo, however, never died out completely, and investigators discovered covert ceremonies continuing until at least the 1930s, although they had become rare. Much more important have been the Spiritual churches, which combine elements of Pentecostalism, Catholicism, and Spiritualism with survivals from Voodoo. By the 1920s congregations had appeared in New Orleans, Chicago, and elsewhere. These organizations adopted many aspects of Voodoo, including service to a variety of spirits. The most important of these was Black Hawk, a nineteenth-century Native American chief, whose people fought a losing war to prevent U.S. expansion into their homeland. Scholars suggest that Black Hawk achieved prominence because he shared with African Americans the experience of oppression at the hands of whites. Modern believers also accept reincarnation and practice magic, which they call "spiritual work." Church members, however, generally consider themselves Christians, relying heavily on the Bible and Apostles' Creed-like statements of faith to support their beliefs.

The practitioners of diasporic African religions found their beliefs being increasingly vilified by white popular writers during the first half of the twentieth century, who depicted

➤ HOODOO IN THE UNITED STATES

Zora Neale Hurston, a key figure in the Harlem Renaissance movement in U.S. arts and literature, was trained as a folklorist and also a novelist and playwright. The following is from her memoir *Mules and Men* (1935), which included descriptions of her own apprenticeship to hoodoo practitioners in New Orleans:

"New Orleans is now and has ever been the hoodoo capital of America. Great names in rites that vie with those of Hayti in deeds that keep alive the powers of Africa. Hoodoo, or Voodoo, as pronounced by the whites, is burning with a flame in America, with all the intensity of a suppressed religion. It has its thousands of secret adherents."

—Jeffrey Elton Anderson

them variously as witchcraft, criminal religions, or devil worship. Chief among such writers was William Seabrook, whose *Magic Island* (1929) depicted Haitian Vodou ceremonies as sinister and typically sexual in nature. Another author in this vein was Robert Tallant, who wrote a sensationalistic treatment of Louisianan beliefs titled *Voodoo in New Orleans* (1946). At the same time that authors were promoting negative stereotypes of these faiths, the religions were often suffering severe repression in their homelands. Nevertheless, with the possible exception of U.S. Voodoo, they survived and even prospered.

Christianity in Africa

Africa moved from being a peripheral to a central part of the Christian world in the first half of the twentieth century. Throughout the nineteenth century the Christian missionary impulse grew stronger in Europe, North America, the Caribbean, and Australasia, and Africa was a central target of these missionary efforts. The mission presence was strongest in coastal areas, particularly along the Atlantic coast; regions that were also undergoing white settlement, such as South Africa and Kenya; and in the areas under the strongest colonial control, such as Angola, Senegal, and Liberia. In general, the rate of conversion was low and attracted the marginalized in the nineteenth century; however, during the first half of the twentieth century the growth of Christianity became explosive.

There are several factors that contributed to this explosive growth during 1900–1945. First, colonial conquest threw doubts upon indigenous cosmologies, which made Africans more receptive to hearing about other religious options. As more Africans began to preach to fellow Africans with whom they shared language and culture, the rate of conversion quickened. Thus it was largely Africans themselves, not foreign missionaries, who were responsible for the spread of Christianity. Although this sort of indigenous missionizing had been occurring in some parts of Africa for decades, in most regions of the continent this did not occur with regularity until the twentieth century. Second, by the twentieth century numerous translations of the Bible into African languages had appeared. The first full translations to appear were often in those languages with the most speakers or converted elites such as Yorubas, isiZulus, and Kiswahilis. Biblical translations permitted literate Africans to learn of the new religion on their own terms. Third, as conversion began to speed up, numerous denominations began to develop their own theological schools in Africa, thereby increasing numbers of Africans who became ordained clergy. The development of an African church leadership helped to remove the perception that Christianity was a foreign religion. African clergy also displayed consistent enthusiasm in evangelism. To many, the spread of Christian-

ity was directly tied to the vindication of black peoples and the redemption of Africa itself.

A number of African Christians, however, began to grow dissatisfied with the Catholic and various Protestant churches over what they felt was second-class treatment by Europeans due to their race. During the decades from the 1880s through the 1920s a number of churches emerged that scholars identify as Ethiopian, a name that derives from Psalm 68:31: “Let Ethiopia stretch out her hands to God,” where Ethiopia is being used as the ancient term for Africa. For many African Christians, this Bible verse demonstrated that Christianity belonged to them as much as anyone. The first church to use this name was the Ethiopian Church formed by Rev. Mangena Mokone in South Africa in 1892. Many similar churches emerged, most often in racially charged areas such as South Africa and typically with ethnic constituencies. Some better-known examples include the Native Baptist Church in Nigeria, founded in 1888; the Zulu Congregational Church in South Africa, founded in 1897; the Nigritian Church in the Gold Coast, founded in 1907; and the Bantu Methodist Church in South Africa, founded in 1933. The Ethiopian churches offered a theology virtually identical to the European-Christian Church they split from but with an entirely African leadership and membership. Many Ethiopian churches still exist in Africa, but new ones rarely formed after the 1920s.

An African reformation began in the 1910s, experienced colossal growth from the 1920s through the 1940s, and continues today. Many churches began to form as a result of local theological differences with both European and Ethiopian Christianity. The style of church that emerged is called Zionist by scholars, taking its name from the fact that many of these churches promoted a concept of a New Jerusalem, or Zion. Although some Zionist churches were formed through schisms with Euro-Christian or Ethiopian churches, many were entirely new institutions founded solely on biblical exegesis or prophetic inspiration.

Zionist leaders reached different conclusions than Euro-Christian or Ethiopian churches about the Trinity, Christology, the Sabbath, sacraments, gender, Levitical laws, and the role of African cul-

tural practices. As examples, the Nazareth Baptist Church of South Africa was non-Trinitarian and viewed the Father as superior to the Son, the Legio Maria of Kenya permitted polygamy, the Église Kimbanguiste of the Congo used honey for communion, and the Celestial Church of Christ prohibited the consumption of pork or crawling animals, shoes on church grounds, and the use of nonwhite candles.

Zionist churches have adopted these differing beliefs and practices either because they believe it is in accordance with God's will or because they view these as harmless cultural practices, compatible with Christianity. Zionist churches have been regularly criticized by theologians, both in and out of Africa, who accuse them of promoting improper forms of Christianity. While the Euro-Christian churches insist that they are the only proper forms of Christianity, the Zionist churches argue that the truth that they present is closer to God's Word.

During the period 1900–1945 both Ethiopian and Zionist churches endured constant suspicion, surveillance, and even repression by colonial authorities. An extreme case was that of Simon Kimbangu, founder of the Église Kimbanguiste, who was jailed by the Belgians from 1921 until his death in 1951. Colonial officials often doubted the religious sincerity of Africans and felt that a separate church was nothing but a front to foment revolution. Only in a very few cases such as the Providence Industrial Mission and the Église des Noirs en Afrique did African churches have anything to do with anticolonial politics. By the 1940s and 1950s many colonial governments were adopting more tolerant positions toward African Christianity. Ironically it was South Africa that perhaps permitted the greatest tolerance, as whites there appreciated Africans self-segregating into their own churches.

What both Ethiopianism and Zionism represented were Africans defining religious truth for themselves. Many other Africans remained content with the varieties of Christianity brought by Europeans. From 1900 to 1945 Euro-Christian churches, Ethiopian churches, and Zionist churches all underwent enormous growth in Africa. At the beginning of the twentieth century approximately 3–5 percent of Africans were Christians; by the end of World War II in 1945

➤ SIMON KIMBANGU

Simon Kimbangu was founder of the Église Kimbanguiste, now Africa's largest Zionist church. He was born around 1887 in Nkamba in the Congo Free State. Kimbangu's first prophecy occurred in 1918 when he believed that he heard a voice tell him, "I am Christ. My servants are unfaithful. I choose you to testify about me and to guide my people to salvation." Yet Kimbangu responded that he was not educated enough, and he did not heed this prophetic calling for three years.

In April 1921 Kimbangu felt compelled against his will to enter the house of a woman in agony. He healed her, thus embracing his prophetic calling. Kimbangu would gain a reputation as the greatest healer in all of the Congo. Thousands of Africans began to make pilgrimage to Nkamba. The mass conversion of these pilgrims became known as the Nkamba Pentecost. Kimbangu told them to renounce violence, polygamy, alcohol, tobacco, hemp, dancing, and the use of indigenous medicines. These pronouncements form the core of Kimbanguist theology.

Many whites living in Belgian Congo were convinced that Kimbangu was using religion as a disguise to foment rebellion. He was arrested in September 1921 and convicted of hostility to the state, instigating violence, and general insubordination. He was given a sentence of 120 lashes and execution, later commuted to life imprisonment. Kimbangu was whipped and transported to Lubumbashi. He spent most of his sentence in solitary confinement. Kimbangu died in the prison hospital in 1951.

—Joel E. Tishken

the figure was more than 33 percent. Thus, during the period from 1900 to 1945 Africa became a central part of the Christian world.

The Global Reach of Islam

The global reach of Islam in the first half of the twentieth century is highlighted not so much by Islam's expansion into new territorial regions as by its deepening extension into the societies across the world that it had already penetrated in earlier ages. By the dawn of the twentieth century Islam had truly established itself as a world religion. Even the commonly held assumption that Islam did not come to the Americas until the twentieth century fails to recognize the number of Muslims, however much a minority, who were brought to those regions by virtue of their African Muslim heritage as part of the North Atlantic slave trade from as early as the eighteenth century or possibly even the seventeenth century. In the case of Central and South America, there are claims that peoples of Muslim heritage left over from Moorish Spain, however limited their numbers may have been, came in the Spanish and Portuguese conquests of those continents in the fifteenth and sixteenth centuries.

The importance of understanding this background with respect to the global reach of Islam in the first half of the twentieth century lies in one's view of history, namely that the new waves of fresh Islamic influx into North and South America at the dawn of the twentieth century were just that, new waves breaking over long-forgotten ones, albeit comparatively in increasing measure. Indeed, the Western expansion into the old Islamic heartlands of Asia and Africa throughout the eighteenth and nineteenth centuries, together with world population growth stimulating migration that was aided by newly developed forms of transportation emerging from the Industrial Revolution, the steamship and railroad in particular, opened new corridors of passage for immigrants from various parts of

Islam's domains to enter and take up life in what for them could still be called the New World.

Renewed interest in Islam in the late nineteenth and early twentieth centuries occurred among not only African American communities but also small numbers of Caucasians, with the earliest such conversion dated to 1888, a certain Muhammad A. R. Webb who eventually established the Oriental Publishing Company in New York through which he published, among certain other works, *Islam in America* in 1892. But knowledge of Islam was being perpetuated not only by a slowly increasing Muslim presence within North America but also by the deeper study of Islam among Western scholars as a result of their own increased penetration into the Islamic world via Western expansionism. In particular, the field of study that traces its roots back to F. Max Muller (1823–1900) and came to be known as the history of religion(s) spawned, for example, the first Parliament of the World's Religions held in Chicago in 1893, providing yet another opportunity not only for small numbers of Muslims to migrate to North America but also for Islam to receive further spotlight and propagation in the North American context during that highly international period.

And so these trends continued into the early twentieth century, with a large number of Muslims immigrating to the United States alone. For example, some 86,000 Syrians arrived in America from 1899 to the onset of World War I in 1914. Many were Christian, but a sizable number were Muslim. Some took advantage of free land grants by the U.S. government during that period and established small Islamic communities like those that sprang up in Rugby and Williston, North Dakota. Albanians likewise opened a mosque in Maine in 1915, while Tatars who had migrated to Poland during the Tsarist Russian period left that interim homeland amid the turmoil of the Bolshevik Revolution, settling in Brooklyn and other areas of New York and opening small mosques there. Similar accounts could be cited, though perhaps in lesser number, within the Canadian context.

Although many of Muslim background had come to Central and South America as part of exploration expeditions or the slave trade starting with the sixteenth-century Spanish and Por-

➤ AFRICAN AMERICAN ISLAMIC HISTORY IN AMERICA

The surge of interest in Islam that occurred among those of African descent in the late nineteenth and early twentieth centuries in the United States was not primarily motivated by a concern for religious truth but instead was closely tied to the crisis of identity occurring in the context of racial prejudice and oppression in the post-American Civil War period. The Emancipation Proclamation had been issued by President Abraham Lincoln in 1863, but equality was still a long way off at the dawn of the twentieth century. Groups like the Ku Klux Klan (KKK) were founded immediately following the Civil War, and though their activities were outlawed, they reorganized and experienced revival in the early twentieth century. Not only KKK-type groups but also many white Christians used the Bible to support ideas of white racial supremacy and its counterpart of black racial inferiority. It was also the dawning of Darwinian evolutionary science, and some white Christians went so far as to argue that those of black African descent were not human but instead were still at a prehuman stage

in the evolutionary process. Against this degrading background, black identity and black pride issues were of deep power and significance. Some in the African American community saw Christianity as the religion of the white man, the oppressor and enslaver of the black man (this sentiment can be seen as early as the 1845 publication of Frederick Douglass's slave narrative). Islam provided a counterreligious identity and divine authority that vested the black African with dignity and equality or, as the case was also, a counternarrative of black supremacy. It was not until much later in the twentieth century, after the Civil Rights Movement and the passing of the civil rights bills in its wake in the 1960s, that black Islamic leaders would, through their Hajj experiences, begin to align themselves more closely with traditional Islamic teachings and practices. Until that time, the movement of Black Muslims, as they were also called, was primarily an ethnic-cultural identity movement employing religion in its cause.

—R. Charles Weller

tuguese expansions into those realms, a renewed surge of Arab immigrants mostly of Syrian, Lebanese, or Palestinian origin began to trickle into Honduras and other surrounding areas from the 1890s onward, particularly after World War I. A sizable number of these were Christian, but many were Muslim. If we are thus to inquire into the histories of the Muslim communities in countries such as Trinidad, Guyana, and Suriname or farther south in Argentina where, in some cases, as much as 10 percent of the population today are Muslim, these late-nineteenth and early-twentieth-century migrations played an important role.

Peculiar to the United States in this period was the emergence of several rather unique yet related Islamic movements among those of African American descent, linking Islam as they did to their native identity and merging it with what can be called the beginnings of black nationalism stirring within the larger context of Asian, African, and Middle Eastern anticolonial nationalist and renewal movements taking shape across the globe in this same period. Against this inter-

national background and World War I that would erupt around it, the Moorish-American Science Temple was established in New Jersey in 1913 by Timothy Drew (1886–1929). Drew was one of the first African American converts to Islam, subsequently changing his name to Noble Drew Ali. More significant and lasting, however, was the Nation of Islam founded in the 1930s by Wallace D. Fard Muhammad and taken over upon his death in 1934 by one of his followers, one who would become, in the place of the original Prophet Muhammad, the Nation of Islam's recognized prophet, Elijah Muhammad (1897–1975). From out of these streams, central figures would emerge to significantly impact the American sociopolitical scene in the latter half of the twentieth century. The Nation of Islam did not originally practice the five pillars of traditional Islam or observe its annual holidays and customs.

Turning our attention toward Europe in the same period, we have, for example, the Great Mosque of Paris being built in 1922, indicating an increased Islamic presence there in that period. In Germany, by 1900 there were already

some 10,000 Muslims residing there, owing to long-standing ties between Germany and the Ottoman empire, but this number more than doubled during World War I, when approximately 15,000 Muslim prisoners of war were taken, resulting in the building of a mosque in Berlin in 1915 that functioned until 1930. England likewise had some 10,000 Muslims residing there by the early twentieth century due to its prolonged imperial contact with Mughal India, Afghanistan, western Africa, and other regions of the globe where the Islamic presence was formidable.

But all these serve only as examples, since Islam's spread in the first half of the twentieth century in the West would require a detailed accounting of each ethnic, cultural, and/or political domain into which it entered during that period.

Two related events of significance should be noted at this juncture that aided the spread of Islam in the broader English-speaking West and its imperial domains. These two events were two translations of the Quran into English, one by Muhammad Marmaduke Pickthall in 1930 in India, published in England in 1939, and one by Abdullah Yusuf Ali in 1938 in Lahore, India (later Pakistan), with the latter figure helping to open the al-Rashid Mosque in Alberta, Canada, in 1938 from where his translation was disseminated in North America and beyond.

Apart from western Europe and the American continents, Islam had a fairly established history in eastern Europe via the nations of Bulgaria, Albania, Bosnia, and other such countries. Its growth across eastern Europe, including Russia and Siberia, during the early twentieth century was minimal. Indeed, to the contrary, Islam suffered significant setbacks in the antireligious milieu of the Soviet communist world. Likewise, except for northwestern and other specific regions of China where Islam had a long and rich history, its historical spread into broader eastern Asia was extremely limited during this period and remains so to this day. Renewal movements counteracting Western imperialism and competition with Christian missions occurring in the context of that imperialism did result in a measure of growth in India, Southeast Asia, and particularly inland Africa, but overall there was not a great deal of

new ground gained in those regions apart from perhaps the emergence of the Muslim nation of Pakistan in 1947, which was more a redefining of the balance of power and identity in relation to predominantly Hindu India than a spread into new territory.

Consideration of such growth and spread into new territories and among new cultural groups aside, there are two significant factors emanating from the Middle Eastern heartland that gave shape to global Islam in the early twentieth century. First among these would be the various renewal movements that arose out of Pan-Islamic, Pan-Arab, and Arab nationalist as well as Ottoman-Turkish nationalist reform movements that took shape in the nineteenth century. These all came successively in response to the seemingly unstoppable extension of Western power into Islamic (and broader Afro-Eurasian) domains. Two Islamic renewal movements in the early twentieth century stand out in particular, namely the Muslim Brotherhood (Ikhwan al-Muslimi), birthed in Egypt in 1928 under the guidance of Hasan al-Banna (1906–1949) and Sayyid Qutb (1906–1966), and the Islamic Society (Jamaat-i-Islami), brought to life in 1941 through the reform efforts of Mawlana Abul Ala Mawdud (1903–1979) in India. These two movements have served as significant models and sources of inspiration for countless other Islamic revival movements around the globe to the present day.

The second major factor affecting global Islam in this era was the disappearance of the last three great Islamic empires, namely the Ottoman, Safavid Persian, and Mughal Indian empires, with the Ottoman empire holding out longest, down to the close of World War I when its territories were divided up among the European powers, creating in their demise a crisis of authority throughout the Islamic world and evoking the renewal movements just noted above.

Spread of Asian Religions

A prevalent theory in western Europe and North America suggests that Asian religions did not reach the West until the counterculture movements of the 1950s and 1960s, when these movements provided propitious ideological and social conditions for the general reception of Eastern ideas. The emergence of the New Age movement in the 1980s and later was also largely influenced by Asian as well as North American indigenous spiritual and religious sources. However, the expansion of the great traditions of Buddhism and Hinduism to the West can be dated back much earlier to the end of the eighteenth century and the beginning of the nineteenth century. The fascination for an idealized Orient at that time—manifested in the aesthetics and literature of the Romantic movement—provided the framework through which these cultures could be understood.

The expansion of Asiatic religions in the West was initially marked by a process of importing a Western enthusiasm for Asian spirituality. But from the end of the nineteenth century, it was from a waning influence of monotheism that Asian religions expanded within the West. These included modernist Buddhist movements, such as the Chinese Mahayana of the monk Taixu (1890–1947), the Japanese Zen of Soyen Shaku (1859–1919), and the Cingalese-Burman Theravada reformed by Anagarika Dhammapala (1864–1933), as well as contemporary Hindu movements, such as that inspired by Ramakrishna Vivekananda (1863–1902).

The first session of the World Parliament of Religions held in Chicago in 1893 offered a platform for representatives of Asian traditions, such as Chinese Buddhism, Singhalese Buddhism, and Indian Hinduism, among others. The parliament also gave Western audiences a direct means of contact with exponents of these religions. Although during the first several decades of the twentieth century the expansion of Asian reli-

gions was fairly limited to intellectual and urban centers, by the post-World War II era they were gaining a wider audience and had a greater social influence. The foundation of intellectual circles, such as London's Buddhist Society in 1907, was accompanied by the building of the first Buddhist temples destined for a Western public, with the first being established in Switzerland in 1911. At the same time, Hinduism experienced a growing popularity in both North America and Europe, notably through the impetus of the French author René Guénon (1886–1951), whose writings sought to bring a fuller understanding of Eastern religions to Westerners.

Asian religions were not only expanding through missionary zeal, as the occurring migration flows also contributed to their expansion. The movement of Asian populations from China and Japan toward America and Australia for economic reasons in the mid-nineteenth century led to the establishment of new religious institutions. In the United States the first Buddhist temples were built in the 1880s and 1890s, but they were exclusively for immigrants.

During the latter part of the nineteenth century and the early part of the twentieth century, Asian religions were also engaged in a process of reconquering Asia. In India—with the movements of Arya Samaj of Dayananda Saraswati (1824–1883) and the Yoga of Sri Aurobindo (1872–1950)—and throughout Southeast Asia, such as the Young Men's Buddhist Association in Myanmar founded in 1898 by C. S. Dissanayake. These movements emerged as a reaction to Western colonialism but were paradoxically organized along religious, educational, and political models inspired from the West. The renewal of Buddhism in India—through the initiatives of Anagarika Dhammapala, also known as David Hewawitharne, and of the Theosophical Society, founded in New York in 1875—embodied this fusion of Asian and Western influences active in the expansion of Asiatic religions. While some religious traditions, such as Chinese Daoism, slowly disseminated owing to the diffusion of Asiatic medical systems, "ethnic" religions, such as Japanese Shinto and its firm rooting in its national and cultural contexts, never experienced such expansion processes.

Soviet Atheism

Upon the seizure of power in October 1917, the Bolsheviks set about restructuring Russian society according to Marxist ideals, thereby radically altering the existing centuries-old hold of the Orthodox Church over much of the Russian populace. The Bolsheviks had emerged from a radical and cosmopolitan Russian intelligentsia that was imbued with a zeal for radical social change and a distaste for anything that retained

the trappings of the Old Regime, including the Orthodox Church. The Bolsheviks were determined to remake the new Soviet society along a Marxist order. Russian Orthodox Christianity had a hold over a vast mass of the population, particularly the peasantry, and was a significant factor in the antipathy most Russians had against the new Bolshevik regime radiating from Petrograd. Islam, Buddhism, and other faiths of significant size within Bolshevik-held regions were also affected by state policies regulating and prohibiting religious practices, driving many of them underground where they often served as clandestine forms of resistance against the Communist Party-state. However, during World War II when the Soviet state decided that it would be advantageous to rally national fervor against the Nazi onslaught, state policy against religions throughout the Soviet Union was somewhat relaxed.

From 1917 well into the late 1930s, the Soviet state was active in seeking the destruction of the Orthodox Church and the instatement of state atheism as the official ideology of the Soviet Union. As Karl Marx and V. I. Lenin had argued, state atheism held that the institution of religion served the interests of the bourgeois classes in that they held the illiterate masses to bogus superstitious beliefs of an afterlife, preventing them from seeking social justice in this life. In order to “build socialism,” it was necessary for the state to actively replace the existing cultural belief systems of the people with the Marxist ideological worldview. The Bolsheviks sought to promote a new conception of Soviet citizenship through the implementation of this new paradigm via public education, legal changes, police enforcement, and social policies. The state actively sought to dissipate religious values in Soviet society through the promotion of secular values via cultural events, festivals, films, and propaganda.

In spite of these efforts, Russian Orthodoxy, as the former state religion under the tsarist regime, remained a significant factor in peasant resistance against the Soviet regime. Driven underground, deprived of its land and its assets and with its clergy persecuted and exiled, the Orthodox Church sustained a precarious existence as it provided a form of passive resistance

► ANTI-CHRISTMAS CELEBRATIONS: STATE ATHEISM AND HOLIDAYS

In their efforts to dissuade people from celebrating Christian holidays and feast days, the Soviet state organized festivals and celebrations that offered an alternative, albeit with a very pronounced political message mocking religion. Running from December 25, 1922, to January 6, 1923, the Moscow Komsomol (Communist Youth League) organized the first Komsomol Christmas (or anti-Christmas). It served mainly as a parody of Orthodox Church rituals, Christmas processions, and holiday traditions through such activities as atheist caroling, antireligious films, and plays or processions in which participants carried “red” Christmas trees. These celebrations provoked angry reactions by locals in certain locales outside Moscow. Anti-Easter celebrations followed in later years, also serving as ways of propagating state atheism and as criticism of the Christianity lingering in Soviet society, particularly among the elderly. Following the beginnings of the Cultural Revolution of 1928, the state was more careful in not insulting the sensibilities of fervent believers, seeking to sway them through persuasion by adapting to their beliefs rather than forcing them to reject their faith outright.

—Abraham O. Mendoza

by dissidents who quietly continued to practice their faith in secret, vulnerable to arrest and imprisonment. Adherents of other faiths in Central Asia and the Russian Far East also clandestinely kept their religious traditions in the midst of Soviet efforts to stamp out their faiths and replace them with state-sanctioned atheism.

Through various political festivals, the activism of Komosols (Communist Youth Leagues), and official police and state actions, organized religious organizations were circumscribed and gradually disbanded, with churches, mosques, and synagogues ultimately seized by the state. Legislation passed early in the establishment of the Soviet state required that religious property be seized by the state for the purpose of designating it for other purposes, such as schools, movie theaters, workers' clubs, and other uses that served the public. Soviet policy decreed that such organizations served no purpose in society, as they were relics of the Old Regime and the treasonous bourgeoisie. Furthermore, in order to replace the iconography and symbolism of religion, the party actively supported the cult of Lenin and later the cult of personality of Josef Stalin, founded on the mythologization of his status as a leader and symbol of the Soviet state and ideology. Communist organizations, such as the Komosols, were active in organizing celebrations and marches glorifying the Soviet state, particularly during the Five-Year Plans and collectivization. Unlike many of the older generations who remembered the days before the Russian Revolution, younger people were prone to fervently adhering to the revolutionary tenets advocated by the Soviet state. Holidays and festivals that had their origins in the Orthodox Church were replaced by state holidays (e.g., May Day, Harvest Day, and Day of the Tractor), whose celebrations actively competed for the public's attention.

Christianity in Oceania

Christianity came to Oceania through contact with Europeans in the sixteenth century. However, it was not until indigenous missionizing took place in the late nineteenth and early twentieth centuries that Christianity began to spread at a quick pace. With adoption also came adaptation, and Oceanic peoples began to create their own Christian movements. Some movements integrated a good number of ideas from indigenous religions, some took their inspiration from a desire to gain the power of whites, and others disputed theological tenets of Western Christianity. The process of adaptation indigenized Christianity, transforming it from a foreign religion to a central part of Oceanic identity.

Missionaries arrived during the nineteenth century, predominantly from Latin America, Australia, and New Zealand, and established mission societies throughout Oceania. Various factors influenced the distribution of missionaries including geographic proximity to the host nation, colonial influence, population density, and the prior presence of rival mission societies. In general the rate of conversion was low and attracted the marginalized in the nineteenth century. However, the rate of conversion exploded in the first half of the twentieth century.

Several factors contributed to this explosive growth during 1900-1945. The primary factor was colonial conquest that threw doubt upon the power of indigenous cosmologies. Doubting their indigenous beliefs made Oceanians more receptive to hearing about other religious options. Second, by the twentieth century, numerous translations of the Bible had begun to appear, principally in Polynesian languages and less frequently in Micronesian or Melanesian languages (where each language tended to have far fewer speakers). Biblical translations permitted literate Oceanians to learn of the new religion on their own terms. Third, increasing numbers of Oceanians became ordained clergy. Oceanian clergy displayed a consistent enthusiasm for evangelism and helped to produce an image of Christianity as an indigenous faith. Undeniably the greatest spread of Christianity within Oceania was the result of indigenous missionizing,

➤ TAHUPOTIKI WIREMU RATANA

Tahupotiki Wiremu Ratana, a native Maori of New Zealand, began his prophetic career in 1918. He believed this initial vision to be of the Holy Spirit who told him that he was the mouthpiece of God (“Te Mangai”) and was to unite the Maori people and turn them to Jehovah. Additional visits from angels and the Holy Spirit caused Ratana to give up drinking and to begin healing. His reputation and following spread throughout the Maoris of New Zealand, simultaneously fulfilling his dual goals of conversion and unification. The Ratana Church was founded in 1925 and remains the largest indigenous Maori church. Ratana taught that angels protected his church, which led to his alienation from other Christians. Feeling that religious goals were inseparable from political ones, Ratana campaigned for Maori rights in New Zealand and even secured four seats in Parliament for Maoris. He died in 1939.

—Joel E. Tishken

(Alan Liefing)

not the actions of foreign missionaries. The combination of these factors meant that most Christian denominations could be found across Oceania (though with uneven distributions) by the end of World War II.

Colonialism grouped together many islands and populations that had previously contained disparate identities divided by history, culture, and language. Christianity often served as a point of common ground among distinct groups that shared little with their neighbors in the newly formed colony. Thus, in a number of cases, perhaps most notably in Marquesas, Samoa, and the Cook Islands, Christianity provided an impetus for the development of a modern national identity.

Like peoples in other regions, Oceanic peoples adopted and indigenized Christianity to suit their local religious desires. A suitable

term for these indigenized variants of Oceanic Christianity has yet to emerge. Within Melanesia they have historically been called cargo (*kago*) cults. However, this term may perpetuate colonial images of naive Melanesians who improperly understand the modern world more than it describes any Oceanic religious reality. Regardless, no single term could suffice given the diversity within Oceanic Christianity. Two concerns dominated these indigenizing movements: theology and a desire to gain the power that whites had.

Colonial conquest shamed traditional institutions and called the supernatural power of indigenous religions into question. The global success of Europeans was attributed, in significant part, to their Christian religion. Many groups assumed that by making Christianity their own, they too would enjoy the power, prestige, and wealth

that whites enjoyed. The first of these indigenizing movements began to emerge as early as the 1820s. However, World War II gave large impetus to this thinking when the material wealth of Western nations, particularly the United States, was put on grand display across Oceania.

Although these movements shared the common goal of ushering in a time of prosperity, they differed in the degree to which they integrated indigenous traditions. Most movements underwent a complex theological evolution, sometimes appearing more Christian than at other moments. For instance, in the 1940s the Yali movement of the Madang District of New Guinea formed around the belief that both the ancestors and God would bring cargo in the future. When material wealth was not forthcoming, Yali relied upon traditional imagery more and more often. Another example of this sort of movement is the Jon Frum (or Jonfrum) movement of Tanna, in Vanuatu, that formed in the 1940s. Jon Frum is likely a mythical figure and not a historical character. Over time, various traditions regarding indigenous myth heroes, American nationalism, and Christian apocalypticism were crystallized into the single figure of Jon Frum. Thus, these movements were not static but instead were able to adapt to the changing circumstances of the lives of Oceanic peoples brought by colonialism, World War II, and later independence.

Theological concerns underpinned still other indigenizing movements and practices. Like others across the globe, Oceanic peoples reached their own conclusions about the best ways to practice Christianity. Some of these conclusions were reached through biblical exegesis, and others were arrived at through prophetic inspiration. For instance, Ten Naewa emerged on the island of Onotoa in the southern Gilberts in 1930. Naewa declared that he was a prophet of God and had been instructed that God would soon descend to the island. When the appointed day of God's arrival passed without event, the Catholics were blamed, and Naewa's male followers (the "swords of Gabriel") killed two Catholic Onotoans. In New Zealand, Tahupotiki Wiremu Ratana believed that he was the mouthpiece of God based upon his prophetic experi-

ences and healing gifts. Ratana and his followers were alienated from other Christians due to their prophetically inspired belief that their church was protected by angels. Ratana founded his own church in 1928 and campaigned for Maori rights with the belief that religious goals were inseparable from political ones. His church is now among the largest in New Zealand.

Because of Christianity's spread and adaptation in the first half of the twentieth century, Christianity has become a vital part of Oceanic identity. Oceania is, at the beginning of the twenty-first century, the most Christian region of the world. With the notable exceptions of Fiji and New Guinea, all Oceanic nations are now 90 percent or more Christian. Nations such as Samoa and Tuvalu are estimated to be at least 98 percent Christian. The majority of conversion to Christianity in Oceania, like in Africa, has taken place within the last century, particularly during the first half of the twentieth century.

Indigenization of Christianity

The indigenization of Christianity is as old as Christianity itself. All religions are indigenized—or modified as they spread to suit local needs—whether those changes are cultural, religious, political, or social. The integration of local belief, ritual, or culture to an evangelical faith such as Buddhism, Islam, or Christianity is commonplace and explains why such religions are practiced differently in diverse places. In reality there is no such thing as Christianity as a

singular religion. Christianity is really a group of loosely associated subtraditions with regional variations. The period of 1900–1945 was particularly significant to the process of indigenization. First, movements emerged that indigenized Christianity within an existing church. Second, new global trends in the (re)definition of race and nation caused some populations to create new national churches. And third, indigenization followed the rapid spread of Christianity by missionaries.

During this time period, a number of movements emerged that indigenized Christianity within an existing church. These movements emerged in response to global changes taking place in the early twentieth century, particularly the two world wars, colonialism, and the rise of new ideologies such as communism and fascism. In France, for instance, there emerged a new attitude toward ecumenism within the Catholic Church. Prominent theologians such as Yves Congar, Marie Dominique Chenu, Henri de Lubac, and Jean Danielou argued that global ecumenism would also lead to the innerrenewal of the Catholic Church. They contended that Protestant and Orthodox churches had theological insights that could benefit Catholicism. The movement can be seen as indigenization in the sense that it slowly integrated a more liberal theological perspective, from western Europe, into the global Catholic Church. Similar indigenizing movements within a church may be found in the creation of new shrines (such as Fatima in Portugal in 1917), ordination of female clergy (Church of God in 1909; Assemblies of God in 1914), or a host of other prayer groups, healing movements, women's groups, and charitable societies. Each of these groups or movements wished to improve their existing church through the integration of their local perspective.

Indigenization was also prompted in this period, as new global trends in the (re)definition of race and nation caused some populations to create new national churches. The indigenization taking place in these situations did not typically concern theology, which continued to resemble that of related Christian bodies. What was indigenized was the leadership structure, which was assumed by people of a particular race or

ethnicity, and church practice, which became more ethnic or national in character. Some examples of this from around the world include the emergence of the Iglesia Filipina Independiente in the Philippines in 1902, the formation of separate black churches among peoples of African descent (such as the Spiritual Baptists in Trinidad in the 1910s and 1920s), creation of new national Protestant churches in many parts of the world (e.g., the American Lutheran Conference in 1930), or the emergence of newly independent Orthodox patriarchates (Georgia in 1917, Serbia in 1920, and Albania in 1937). In situations such as these, parishioners did not feel that their local needs could be met without the creation of a distinct religious body.

Finally, because of the Christian missionary zeal of the nineteenth century, Christianity had begun to spread rather rapidly by the first half of the twentieth century. This spread occurred in regions where Christianity was previously little known such as in Africa, Oceania, and many parts of Asia. As new groups from these regions embraced Christianity, they often altered the theology and the leadership structure to entirely suit their religious needs. There are countless examples of this, but some that formed during this period include the Non-Church Movement (Mukyokai) in Japan, the Nazareth Baptist Church of South Africa, and the Ratana Church of New Zealand. Kanzo Uchimura, founder of the Non-Church Movement in Japan, rejected an institutionalized church as a Western invention. He insisted that the church should be as invisible as faith. In the 1890s and early 1900s Uchimura formed loosely organized Bible studies organized along the more familiar Asian teacher-pupil relationship. Isaiah Shembe formed the Nazareth Baptist Church in South Africa in 1910. Based on his prophetic experiences and biblical exegesis, he insisted that salvation came through proper Saturday observation of the Sabbath and adherence to God's law. He permitted some Zulu practices such as dance and plural marriage for existing polygamists. In New Zealand, Tahupotiki Wiremu Ratana, founder of the Ratana Church, believed that he was the mouthpiece of God based on his prophetic experiences and healing gifts. He eventually founded his own

church in 1925. These three founders, and many like them around the world, indigenized both church organization and theology, seeing the truth of Christianity as being distinct from Western culture.

Tension exists between newly indigenized forms of Christianity and older churches of the Western world. What is at stake is the ownership of Christianity. Churches that developed within the Western world view themselves as the inheritors of the apostolic mantle and therefore the judges of what is proper Christian belief. Many theologians and missiologists from Western-style churches have judged newly indigenized forms of Christianity to be in error with improper theologies. Yet because there has never been such a thing as a single Christian truth, variants of Christianity can be neither right nor wrong. Many forms of newly indigenized Christianity argue that Christianity is a universal faith that no one culture owns. They would argue that truth is best revealed by God and the Bible, not by human traditions and cultures as these older churches have defined it.

All churches in existence today are the products of indigenization themselves, whether or not they remember their own past that way. For instance, one cannot possibly explain the Catholic Church in Ireland without regular reference to Celtic culture or explain the Russian Orthodox Church without Russian traditions. The definition of Christianity has always been disputed and will continue to be in the future as the indigenization of Christianity continues. For large parts of the world, that process began apace during 1900–1945.

Global Spread of Protestantism

In the early twentieth century, European powers believed that war had been successfully overcome. Focusing their attention on colonial expansion meant that violent conflicts tended to occur in other parts of the world and not in Europe. However, as the European Great Powers had eventually expanded into most parts of the world, their focus was once again on Europe, as the crumbling Ottoman empire left parts of the Balkans in disarray. As events from this region ignited World War I, they also raised questions about the work of Protestants (such as Anglicans, Presbyterians, and Methodists) in spreading their message. As had been true from very early in the Reformation, Protestants were badly divided in their doctrine, and this meant that they did not present a unified response to the challenges of World War I. These challenges revealed differences not just in specific doctrines such as eschatology (study of the end times) or social theory but also in their concepts of authority and how to settle differences as well as their understanding of what is foundational.

Following the flurry of activity and expansion of Protestant Christianity in the nineteenth century, the early twentieth century can be understood as a time of challenges that exposed internal divisions within Protestantism and heightened external rejections of the Protestant message. For some time Protestants had united their teachings with the philosophical and cultural assumptions of western Europe, including the perfectibility of humanity through a changed environment, an interpretation of nature based on Uniformitarianism that ruled out special creation or miracles as mythology, and the combination of these into a linear progression of Western culture into a millennial age.

Although there were premillennial groups in the nineteenth century, it was common during that period for Protestants, both conservative and liberal, to believe in the progress of humanity and the ability for good to overcome evil through social progress (a version of postmillennialism that focuses on natural evils and fruit sin rather than root sin). What the twentieth century revealed

► PROTESTANT CONCEPTIONS OF AUTHORITY

The issue of authority has always been a problem for Protestants from the struggles leading to the Peace of Augsburg (1555) to the present and the seemingly unending number of denominational divisions. Having rejected the ecclesiastical authority of Roman Catholicism, Protestants never laid the foundation for a united judicial system. More importantly (because of its role in new and continued divisions), Protestants never found a foundation for a united doctrinal system. Although there is a common emphasis on *sola scriptura*, *sola fide*, and *sola gratia*, varying interpretations of the Scriptures have continually given rise to new denominations. Protestants have generally not distinguished between Scripture and that by which Scripture is understood. The consequence has been that different methods of understanding and interpreting have been confused with Scripture itself and have promoted long-standing and deeply felt divisions. For instance, in the fundamentalism/liberalism debate, literalism as an interpretation is asserted as the only meaning of the text rather than as one interpretation with application to some parts of Scripture.

—Owen Anderson

was the extent to which the expansion of good had been understood to be coextensive with the expansion of Western civilization. World War I and its devastation revealed the failures of Western civilization and the inability of Europeans to live in unity. For many within Christianity, this was sufficient proof that postmillennialism was false, and a dramatic increase of premillennial thinking resulted. For many outside of Christianity this was proof that Christianity could not be true since the best it could produce had so colossally failed (an argument all the more reiterated after World War II).

After the war there was a time of this-worldly focus. This need not be interpreted as a decrease in religious activity, although that might account for some of it. Another aspect is that premillennialism and its otherworldly focus on heaven is often accompanied by an emphasis on financial success in this world both as proof of God's bless-

ing and because of a kind of Christian hedonism. The crash of the U.S. stock market and the global depression worked as another challenge that called into question this view of the Christian life. The missionary societies (such as the American Missionary Society) of the nineteenth century struggled to both staff positions and receive donations, although there were times of surprising giving relative to the difficult economy.

Divisions within Protestantism were heightened due to these challenges. Premillennials interpreted the events as indicative of the end of history and worked to save as many individual souls as possible through an evangelical message of sin and redemption as well as heaven and hell. The Liberal Protestant alternative of amillennialism, which rejected both the claim that humanity was improving and the end time interpretations of premillennials, focused on social justice issues rather than saving individual souls for heaven. The Great Depression heightened that focus on the need to develop a Christian social philosophy that included politics and economics as well as justice and law. Because Marxism, although explicitly materialist, relied heavily on Christian moral intuitions about equality (and thus is often called a Christian heresy by thinkers like Jacques Maritain), this appealed greatly to Liberal Protestants and continues to be their central social philosophy. This is a continuation of the impact of European philosophies on Christian thinking, thus revealing that the challenge of the world wars was not entirely heeded.

One of the most controversial issues of the time, which continues into the present day, was the rejection of naturalistic cosmology by some Protestants (such as Congregationalists and some Presbyterians and Methodists). These are called Fundamentalists because their concerns were articulated in a set of writings called the *Fundamentals*, and their willingness to rely on Scripture over the interpretations of naturalistic empiricists has been stigmatized as antiscientific by liberal Protestants and naturalists alike. Although this characterization may be true in many cases, it is especially true of those groups (such as Dispensationalists like Hal Lindsey) who are premillennial and thus downplay achievement in this world and among those who emphasize inspiration

through an immediate intuition through to the Holy Spirit (Pentecostalism).

The latter group is one of the most striking features of twentieth-century Protestantism both in its departure from historic Christianity and its widespread acceptance throughout the world. Pentecostalism as a movement believes that the miraculous events described in the book of Acts on the day of Pentecost are normative for the church. Its interpretation of the challenges of the day is that the church needs spiritual renewal, which is taken to mean a return to the miracles that occurred on the day of Pentecost in Acts. Speaking in tongues, prophecy, and miracles are believed (by Pentecostals) to be continuing signs that the Holy Spirit is at work. Characterized by numerous divisions due to its emphasis on charismatic leaders and individual intuition, this group has spread faster than any other Protestant group and has had effects on other forms of Christianity such as Roman Catholicism. In essence, it is an attempt to find a solution to the questions of division in the church: divisions continue because people have not accessed the Holy Spirit (known through an immediate sensation rather than the work of the pastor or teachers throughout Christian history). Although this movement began before World War I, the events of the twentieth century were viewed as confirmation that other forms of Christianity were not “spirit filled.”

Having been the center of Protestant Christianity and learning in the nineteenth century, Germany also served as the source of these most significant challenges. Coming to a climax in World War II, the Nazi regime appealed to many of the Liberal Protestant ideas of the nineteenth century: the perfectibility of man, the leadership of the German church in civilizing the world, and the need for a worldview that affected all aspects of life (this was influential in Germany and throughout the Protestant world, since many pastors studied in Germany as part of their training). Although many German Christians accepted this view, some did not and instead worked against the Third Reich. This includes theologians and pastors who made public statements about the dangers of National Socialism, perhaps the most famous being Dietrich

Bonhoeffer who was eventually put to death in 1945 for his opposition.

The effects of this part of the twentieth century on the world were a rejection of Europe and colonialism. For Christianity, this meant a reaction against its message or an alteration of its message to take out what was thought to be European additions. This was encouraged by the most influential new theological movement (although European in origin) called crisis theology, dialectic theology, or neo-orthodoxy. Developed by Karl Barth as a reaction against the failures of European liberalism, this view calls for an inductive nonsystematic reading of Scripture whereby God is believed to speak infallibility through fallible texts and persons. God is said to be unknowable apart from this process. Consequently, there is no standard by which claims to illumination can be judged, so this view lends itself to pluralism even if Barth would not have wanted to go in that direction.

Christian Ecumenical Movement

During the first half of the twentieth century, a movement led by Protestant Christians sought to overcome confessional and denominational differences and to bring about unity in belief and practice among all Christians to make whole the one body of Christ. While unity has always been an idealized goal among Christians, the modern

ecumenical movement has its roots in cooperation among missionary groups in the nineteenth century and, as a cohesive movement, played a significant role in twentieth-century world Christianity, with a high point being the foundation of the World Council of Churches (WCC) in 1948.

Early leaders of the movement and its denominational supporters came almost exclusively from established or mainline Protestant groups in Europe and North America. As the movement succeeded in several of its goals between 1910 and 1948, its character necessarily became more inclusive and global. Indeed, it can be argued that as the movement became more open to Christians and Christian practices from around the world, what began as a movement for some degree of institutional unity came to be a force for decentralized, multicentered global Christianity. The result is that today, while the ecumenical spirit still lives on, the organizational movement has lost its focus and, for many Christians, much of its appeal.

The influence of the Christian ecumenical movement can best be seen in the cooperative organizations founded in the wake of the

International Missionary Conference, held in Edinburgh in 1910. Already in the nineteenth century, Protestant leaders founded interdenominational missionary societies in order to pool resources and support intensive programs for evangelism in Africa, Asia, and Latin America. The Edinburgh conference in 1910 brought together the leaders of these early ecumenical societies to discuss the challenges of world missions and to coordinate further missionary activity. More than 1,000 delegates attended the International Missionary Conference, all of them Protestants and most of them from Great Britain and the United States. For this reason, many scholars have portrayed the Edinburgh conference as the point at which Anglo-American Christianity began to take seriously the rest of the world as well as world Christianity. Under the leadership of the American Methodist John R. Mott, also a key figure on the International Committee of the Young Men's Christian Association (YMCA) and the Student Volunteer Movement for Foreign Missions, the delegates decided to create a more permanent organization. Although delayed by the outbreak of World War I, the International Missionary Council was founded in 1921, with Mott serving for 20 years as its first chairman.

Also during the 1920s, two other organizations were established to further the goals of the unfolding ecumenical movement. Five hundred delegates from 39 countries and 91 denominations met in Stockholm in 1925 for the first Conference on Life and Work to coordinate efforts to address social, economic, and political issues. Two years later, in 1927, representatives from 69 denominations gathered in Lausanne to build the theological basis for Christian unity; this was the Conference on Faith and Order. By 1937, the two conferences on Life and Work and Faith and Order agreed that a broader umbrella organization was necessary and called for the establishment of a World Council of Churches (WCC). Although World War II delayed the formal launch of the WCC, a provisional committee was formed, led by the Dutchman Willem Visser't Hooft. After the war, in 1948, 351 delegates representing 147 denominations and 44 countries convened in Amsterdam and founded

► THE CHRISTIAN YOUTH MOVEMENTS

Much of the groundwork for Ecumenicism in Protestantism came about as a result of the Christian Youth Movements. The Young Men's Christian Association (founded in 1844), the Young Women's Christian Association (founded in 1855), and the World Student Federation (founded in 1895) represented the largest colloquium of Protestants up to that time with the specific purpose of working across denominational lines for a global mission. This mission was meant to provide upright moral support; education, both physical and civic; and religious social connections. Many of the founders and participants of these organizations went on to participate in the worldwide Ecumenical movements, arguing for a religious devotion to Jesus Christ that crossed denominational lines. These organizations still exist today, comprising tens of millions of members.

—Peter A. Dykema

the WCC. Visser't Hooft continued to lead the organization into the 1960s and established the Ecumenical Institute in Switzerland with an endowment from John D. Rockefeller Jr. Under Visser't Hooft's leadership, the WCC took an active role in Third World disputes, following the ethical thrust of the Conference on Faith and Work. In 1961 at the WCC meeting in New Delhi, the Russian Orthodox Church joined the council, and the International Missionary Council came under the authority of the WCC, bringing full circle the organizational dynamics begun in Edinburgh 50 years earlier.

A second major thrust of the ecumenical movement has been the promotion of denominational mergers; however, most of these have occurred in North America (the Church of South India, formed in 1947 through the union of three existing bodies, being a major exception) and in the years following World War II.

The Roman Catholic Church and many conservative evangelical groups resisted ecumenical cooperation in the first half of the twentieth century. Disagreements over papal power, the meaning and practice of the sacraments, and the relationship between scripture and tradition separated Catholics from most ecumenical discussions until the openings offered by the Second Vatican Council. In the council's Decree on Ecumenism (1964), Rome acknowledged for the first time that there were authentic Christians outside of the Catholic obedience. Conservative evangelicals resisted the ecumenical movement because, in its early years, its leaders were liberal mainline Protestants seeking to accommodate Christianity to the modern world, while in

the years since the founding of the WCC, conservatives have objected to the council's occasional support of Leftist political movements around the world.

The Christian ecumenical movement unfolded when it did for several reasons. Certainly many Christians came to be embarrassed by the continued splintering of churches over details of doctrine and practice, while other Christians, recognizing the decline of the church's influence in modern secular society, were motivated to seek unity to shore up the church's prestige. From an institutional perspective, it is clear that the opportunities for cooperation in the mission fields of Africa and Asia provided the true impetus for the movement. What began as coalitions among European and North Americans, often working hand-in-hand with colonial regimes to create joint missionary operations and to bring commerce, civilization, and (Protestant) Christianity to the rest of the world, developed into mutual respect for European, African, Asian, Anglo, and Latin American forms of Christianity. The result was a more diverse, global Christianity.

■ Introduction: Political and Sociopolitical Ideologies and Systems

From 1900 to 1945, a wide variety of ideologies characterized social and political movements throughout much of the world, ranging from the political Right in its conservative and monarchist manifestations to the other

political extreme, characterized by Marxism in its various forms. Other ideologies emphasized national and/or racial superiority and thus justified the subordination of others, as in imperialism and some forms of fascism. Such ideologies

contrasted in the extreme with anticolonial paradigms. In the context of the social upheavals and wars of the twentieth century, these ideological systems had a pivotal role in shaping history.

—*Abraham O. Mendoza*

Imperialism and Ideology

In the first half of the twentieth century, attitudes toward European imperialism radically changed as a result of the influence of anticolonial movements outside and within Europe as well as the prevalent activism against colonialism by socialists and communists, particularly after the success of the Russian Revolution (1917). While the European Great Powers were able to expand and sustain much of their vast domains through the interwar period, the gradual realization on the part of European politicians and policy leaders that European prestige and economic might had significantly declined would eventually lead to decolonization in the latter part of the century.

From 1900 to 1914, Britain, France, and Germany, in addition to Belgium, the Netherlands, and Spain, held significant colonial holdings in Africa, Asia, and Oceania. Economic growth, nationalism, and military strategy drove European expansion. The United States and Japan also acquired colonies in the late nineteenth and

early twentieth centuries, bringing two more contenders into the ranks of the Great Powers. With the onset of World War I the Allies used colonial troops in battle, thus raising the expectations of colonized areas for future political autonomy and greater independence. However, as such change failed to materialize, many colonial ex-servicemen returned to their countries of origin, particularly in places such as French Algeria, French Indochina, and British India, and joined anticolonialist movements seeking outright independence. U.S. president Woodrow Wilson's Fourteen Points, with promised to end war with postwar national self-determination for all combatants and occupied areas, raised expectations throughout much of the world. With the acquisition of former German and Ottoman provinces as League of Nation Mandates after World War I, many anticolonialists saw this as a veiled attempt to expand European imperialism under the new guise of Wilsonian rhetoric. Many of these anticolonialist leaders, such as Ho Chi Mihn (1890–1969) in Vietnam, were heavily influenced by the anticolonialist position of the European communist parties led by the Moscow-centered Comintern. Following the success of the Russian Revolution, in which a backward nation overthrew an autocratic regime and placed the “people” in power, anticolonialist movements the world over found a viable model and ally for their own struggles.

During the interwar period as the revisionist powers of Germany, Italy, and Japan sought to expand their imperial domains at the expense of the British and the French, using the global economic crisis as the crux of the issue, attitudes against imperialism had hardened significantly in much of the West. The Italo-Abyssinian War (1935–1936) and the Japanese attack on Manchuria (1931), conflicts in which the Great Powers were expanding at the expense of weaker regions, shocked world opinion in a sharp contrast with how such events would have been received earlier in the century. Furthermore, internal European aggression from Nazi Germany, directed at the acquisition of territory within Central Europe, drastically changed perceptions of imperialism throughout the West. The overt racism espoused by the National Socialists in their treatment of Slavs, Jews, and other East European

➤ AMRITSAR MASSACRE (1919)

Following World War I, Indian demands and protests for autonomy increased in India. On April 13, 1919, British Indian soldiers under the command of General Reginald Dyer shot an unarmed group of Indian civilians in the city of Amritsar in the province of Punjab. Sources differ on the exact number of total casualties, which range from 379 to over 1,000. Dyer alleged that he was merely trying to put down a potential revolt, but sources contend that it was a peaceable gathering. This massacre shocked people across Britain and British India, thus illustrating the excesses suffered under the yoke of imperialism by colonized peoples.

—*Abraham O. Mendoza*

peoples had a significant impact on how imperialism was seen by many throughout the West. Complicating matters further, some anticolonial nationalists, such as Sukarno (1901–1970) in Indonesia and Subhas Chandra Bose (1897–1945) in India, sought Axis support for their fight against Western colonialism. Nonetheless, with the end of World War II, the consequent ebbing of European dominance across the world, and the rise of the two superpowers, the end of colonialism was at hand.

Liberalism

Liberalism is a political philosophy based upon individual freedom, the essential goodness of mankind, and the value of rational thought. Prior to World War I, liberalism was used in Europe and North America to support the protection of individual freedoms and limited roles for a representative government. Acceptable government duties included the enforcement of civil order, the provision and maintenance of a stable currency, and the protection of citizens from foreign invasion. Liberalism included a belief in laissez-faire economics, which suggests governments should not interfere with the operation of markets. The social miseries created by free-market capitalism and the devastation of World War I led to the postwar rejection of liberal ideas, an increase in the size and scope of government, and the rise of authoritarianism.

Liberalism is derived from two distinct sources. One source, which traces back to classical antiquity, views the primary purpose of government as the protection of individual liberty. This tradition is represented by the political doctrines of the English Whigs in the seventeenth and eighteenth centuries. Whigs favored severe restrictions on the power of the monarchy. The

other source, which developed on the European continent, favored a reconstruction of society in accordance with the principles of reason. This tradition is represented by the Enlightenment philosophies of Rene Descartes, Voltaire, and Jean-Jacques Rousseau. These ideas assume that people are able to recognize problems and take active steps to improve the human condition. These two sources combined in the nineteenth century to become liberalism. Liberal beliefs include government by democracy, equality of men, and the individual freedoms of thought, speech, and the press. Liberalism stands in contrast to conservative and authoritarian philosophies, which favor the restriction of individual liberty by established religious and political authorities.

Liberalism's popularity in the nineteenth century gave rise to powerful political parties in the United Kingdom and Canada. The British Liberal Party, which was influential from 1832 to 1922, supported free trade and individual liberties, but opposed imperialism and government interference in the economy. Notable leaders include William E. Gladstone, Herbert Henry Asquith, and David Lloyd George. In Canada, Wilfrid Laurier led the Liberal Party to power as the prime minister from 1896 to 1911. The liberal movement in the United States never reached the magnitude of that in Europe, primarily because many goals of liberalism, such as the establishment of individual freedoms, were already embodied in the U.S. Constitution and Bill of Rights.

By the end of the nineteenth century, the unregulated industrialization and development of business resulted in huge inequalities of wealth and power. Other undesirable outcomes were widespread pollution, famines, unsafe working conditions, and the use of child labor. Liberalism and its support of free-market capitalism seemed to promote exploitation, colonialism, imperialism, war, inequality, and poverty.

The negative consequences of industrialization led many people, especially poor workers, to question the liberal philosophy. Liberal thinkers developed new interpretations of individual freedom. These included movements to protect workers' rights through the creation of trade unions. Thus, in the early twentieth century, liberalism began to advocate an active role for the

government in the promotion of social progress and the provision of a minimum level of individual welfare. This sentiment was also the foundation of the Progressive movement, which shared liberalism's belief in the ability to improve living and working conditions and advocated change over the maintenance of the status quo. In Great Britain, Liberals successfully implemented national insurance, welfare programs, and laws regulating conditions for workers. In Canada, Prime Minister Laurier's continued support for traditional liberal ideas, such as the promotion of free trade with the United States, led voters to replace him in 1911 with a Conservative Party candidate.

The promotion of a more active social role for government was a distinct departure from classical liberal thought and is now known as social liberalism. An alternative branch of liberalism, which prefers the classical interpretation of minimal government, is now known as libertarianism. The justification for social liberalism is the belief that in order for people to be free, society needs to provide them with basic education, protections, and opportunities. Thus many liberal thinkers advocated laws that mandated minimum standards for wages and working conditions and against the employment of children. Laissez-faire liberals viewed such laws as unnecessary impediments to free-market capitalism.

World War I dealt a severe blow to the popular support of liberalism. There was a perception that liberalism contributed to the conditions that led to World War I. Disillusionment with the duration of the war and the huge loss of life created a backlash against liberal thought. Citizens encouraged governments to play a more active role in managing their economies and societies. Some nations even adopted socialism or fascism as better alternatives to liberalism. This rise of authoritarianism, including the subsequent rise of Nazism in Germany, became a factor leading to World War II.

World War I had a profound effect on societies. It led to the expansion of governmental power and authority in many countries, including the United States, Great Britain, and France. World War I helped destroy the strong belief in liberalism that had prevailed in Europe since the Enlightenment. Liberalism returned to popularity after World War II with the belief that demo-

cratically elected governments would better serve societies than the authoritarian regimes that had emerged in the early twentieth century.

Marxism

From 1900 to 1945, Marxism developed from a European ideological phenomenon into various strains of political movements throughout much of the world. In the previous century, Marxist parties had been mostly associated with radical political movements connected to labor organizations and clandestine intelligentsia. In the twentieth century, however, Marxists forged legitimate political parties participating in elections and office holding, particularly in Britain, France, and Germany. However, theoretical disagreements led to major schisms, particularly between socialists and communists. Major global events, such as World War I, the Russian Revolution, the rise of fascism, events in the Soviet Union under the Stalinist regime, and the coming of World War II, led to major changes in the theoretical and practical applications of Marxist ideology.

The Second International (1889–1916), which was an alliance of European socialist parties, coordinated the interests of Marxist parties in

setting a common agenda. Major disagreements over political participation in liberal government, imperialism, the exclusion of radicals, and questions of national interests plagued the organization. The outbreak of World War I led to its eventual dissolution, as socialist parties from various nation-states failed to hold together against the war, choosing to support their respective countries. However, the more radical contingents split off from their respective socialist parties during the war, most notably the radical Independent Social Democratic Party of Germany. Viewing the success of the Russian Revolution in the dissolution of the tsarist regime, radical Marxist parties across Europe chose to support the overthrow of liberal regimes rather than work within them for the gradual transition of society, as had been the agenda of moderate Marxist parties. These moderates, such as the Social Democratic Party in Germany, found themselves competing for the same voters as the far more radical parties.

Interwar Marxism was characterized by the growing appeal of the Soviet Union under the Stalinist regime, whose ideology was known as Marxism-Leninism. While most of Europe and North America was mired by diplomatic impasses and economic turmoil, the Soviet Union was presented as a beacon of progress and hope to much of the world. The Third International held in Moscow developed into the Comintern (1919–1943), an international communist organization under Soviet leadership, that served as a means to influence events abroad, particularly using European communist parties in order to achieve its ends. The Comintern had links to anticolonialist movements across the world, particularly in Asia and Africa. This left moderate socialist parties, such as the British Labour Party and the French socialist parties, to compete for the same votes as the Moscow-controlled parties with their international appeal.

During this era, fears of communist revolution prompted many middle-class voters to elect fascist leaders into power particularly in Austria, Germany, and Italy, all of which had sizable communist parties. The Great Depression and the diplomatic crises of the 1930s led many socialists to consider allying themselves with communists, as was evident with the Popular Front govern-

➤ KARL KAUTSKY AND SOCIAL DEMOCRACY

Prominent socialist and Marxist theoretician Karl Kautsky (1854–1938), who initially attacked the Marxist concept of social democracy advocated by fellow German socialist Eduard Bernstein, later became a major advocate for it. Kautsky initially sustained a position that supported a workers' revolution and opposed any sort of alliance with liberals in a constitution framework of government. However, after the end of World War I and the onset of the Russian Revolution, Kautsky became more accepting of social democracy as he became more critical of the authoritarian workers' state developing in Russia. In Kautsky's view, the Bolsheviks in Russia had staged a coup against the wishes of the Russian people, sustaining their own interests and ideology and not the will of the majority. In contrast, social democracy would provide the representation necessary for the underprivileged classes, which would gradually assume the mantle of power.

—Abraham O. Mendoza

ments set up in France, Spain, and China under Soviet auspices. Growing fears of German and Japanese power in relation to the Soviet Union had compelled Soviet leaders to search for allies abroad rather than foment a workers' revolution. With the signing of the Nazi-Soviet Pact of 1939, many committed communists found themselves torn between following the Stalinist lead or continuing the fight against fascism.

The outbreak of World War II, with much of the world fighting against the Axis, led to conciliation among communists, socialists, and liberals to fight against global fascism. Many communist partisans across Europe were pivotal members of resistance organizations and sabotage efforts. This marriage of convenience would not obscure the ideological goals that committed Stalinists expected from the postwar settlement. Many Marxists felt that the Red Army that ousted the Germans from eastern Europe along the eastern front paid heavily in casualties, while the United States and Britain allegedly had fought a “side-show” on the Western and Southern fronts. As the guns fell silent in 1945, the Grand Alliance between the Soviet Union and the United States

soured. Communist agitation across Europe and Asia, in tandem with anticolonialist movements, retribution against former Axis collaborators, and growing resentment against former Allies, led to the gradual dissolution of this wayward wartime alliance. The exclusion of communist parties and the toleration of socialist parties across Europe further complicated relations, particularly after the establishment in 1947 of the Marshall Plan, which officially set such conditions for financial aid. The development of peoples' democracies in eastern Europe under Stalinist auspices and the communist victory in the Chinese Civil War in the mid to late 1940s finally led to the onset of the Cold War between the superpowers.

Conservatism

In the first half of the twentieth century, conservatism was not a fixed set of values or ideals that could be deemed an ideology on the same footing as socialism, fascism, or communism. Rather, it was a set of political movements, mostly in the West, set on preserving the political, social, and economic status quo of international and domestic affairs. In the West, it is mostly associated with the British Conservative Party and the U.S. Republican Party, but other variants included staunch royalists such as the Nationalists in Spain or the Center (Catholic) Party in Weimar Germany. Some of these variants hoped to restrain the populism of the far Left social democratic parties that threatened the social and economic stability upon which the conservatives' constituents depended (Britain, France, Germany, United States, Italy, etc.). Other conservative groups hoped to retain the influence of institutions such as the monarchy, the nobility, the military, and the church as political and social actors in national affairs (Spain, Portugal, Germany, etc.). However, amid the political and

economic chaos unleashed by World War I, conservatism confronted the growing popularity of fringe movements on both sides of the ideological spectrum, finding itself on the offensive and, in some instances, having to compromise with the perceived lesser of two evils.

In the United States and the British commonwealth, conservatism was dominated by the industrial class but also by increasing numbers of nationalists, free traders, and farmers. In Britain, it also held large numbers of supporters of the empire and members of the British aristocracy along with their supporters. The onset of World War I, while making conservatives avid supporters of the war effort, also diminished their influence in politics as economic mobilization and the expansion of the welfare-state became an integral part of their respective governments' responsibilities. The interwar period, with its international and global economic crises, found British commonwealth and U.S. conservatives advocating for raising tariffs and closing off trade as well as advocating a foreign policy that recognized their current weakness vis-à-vis the Germans. British conservatives, such as Prime Minister Neville Chamberlain, became advocates of appeasement, while American conservatives such as President Herbert Hoover supported isolationism as responses to aggression abroad by Germany, Italy, and Japan. While remaining fiercely in opposition to fascism, National Socialism, and communism, conservatives did not wish to engage in hostilities unless absolutely necessary. In the midst of the Great Depression, many conservatives supported measures of austerity and balanced budgets, which did not alleviate the needs of the poorer members of society but did do damage to their popularity as they slashed social spending.

In contrast, monarchists, nationalists, and Christian parties in western Europe offered a more assertive reaction amid the tumultuous interwar period than that of the more moderate Anglophone conservatives. Spanish nationalists and monarchists came together under the rebellion of General Francisco Franco in 1936 to fight what they saw as a godless red menace in the Spanish Republic, igniting the Spanish Civil War. Moreover, Catholic and social conservatives in Germany, Austria, and Italy, fearing the

➤ CARLISTS IN INTERWAR SPAIN

The Spanish rightist fringe movement of Carlist monarchists supported a separate lineage of the Bourbon monarchy that descends from Holy Roman emperor Charles V (King Charles I of Spain, r. 1516–1556). While they ultimately succumbed to the right-wing dictatorship of Francisco Franco, they were illustrative of the many varieties of conservatism. Their suspicions of the existing Bourbon line of the Spanish monarchy as accommodating to liberalism in early twentieth-century Spain as well as the growing influence of socialism, anarcho-syndicalism, and communism made them eager to seek allies among other political factions on the Right. Mostly monarchists and staunch Catholics, Carlists sought to destroy the liberal republic, whether it be under the conservative Bourbons or the red Spanish Republicans. They reluctantly supported General Franco's Nationalist rebellion against the Spanish Republic in 1936 in spite of his support for the existing Bourbon monarchy. However, ideological clashes with their nationalist allies, such as Franco's militarists and the fascist Falange, continued to make them an alienated party within the fragile Nationalist grouping. After the end of the Spanish Civil War (1936–1939), they continued to exist in quiet opposition to Francoism and its support of

A group of Carlists enters Badajoz, Spain, on August 15, 1935, following a victory there by Nationalist Army rebels against the Republican government. (Bettmann/Corbis)

the Alfonsine Bourbon line (which was considered the legitimate line descending from King Alfonso). In spite of the liberal traditions established in the nineteenth century and the destruction of the intra-European empires and kingdoms after World War I, similar conservative movements continued to exist in Europe.

—Abraham O. Mendoza

potential uprising of the communist masses, found common ground with far Right fringe groups such as the Italian Fascists and the German National Socialists in spite of their violent and radical ideological tenets. The German Center Party, composed of German Catholics from across Germany, threatened from the political Left, found common cause with nationalists and anti-Semites. Moreover, many European conservatives supported military dictators, such as António de Oliveira Salazar in Portugal, Admiral Horthy in Hungary, and Marshal Pilsudski in Poland, all of whom promised stability amid domestic and international chaos.

The onset of World War II was partly due to the collaboration of some of the continental European conservative movements with Far Right groups (due to their fears of socialism and communism) but also the reluctance of the Anglo-American conservatives to engage the revisionist

powers (Germany, Japan, and Italy) from a position of strength.

Monarchism

Monarchism evolved from a conservative political grouping that supported the European Old Regime monarchies of the Belle Époque to a

➤ WILHELM II IN THE NETHERLANDS

As the popular shout of “hang the Kaiser” rang out through the capitals of the Allies toward the end of World War I, Kaiser Wilhelm II reluctantly abdicated the throne on November 9, 1918, and fled to the Netherlands the next day to live in exile. Much to the dissatisfaction of the Allies, Wilhelm Hohenzollern remained in exile for the rest of his life and continued to be a rallying symbol for monarchists in Germany for decades. He wrote letters, essays, and his memoirs, blaming the German people for their interwar miseries while vindicating himself of any wrongdoing. With the rise of National Socialism in the 1930s, Wilhelm applauded the restoration of political and social order under Adolf Hitler, hoping for his own eventual restoration to the throne. However, Hitler was no monarchist, and Wilhelm was utterly disappointed as he realized that the new German political order did not require the monarchy. In spite of this, during the German occupation of the Netherlands Wilhelm retained a

personal honor guard of German soldiers, which Hitler did not approve of but nonetheless tolerated. Upon his death in 1941, Wilhelm's wish to never return to Germany unless the monarchy was restored was respected by Nazi authorities.

—Abraham O. Mendoza

series of reactionary movements in support of the dethroned pretenders during the interwar period, some of which flirted with other far Right ideological parties in alliance against the mainstream political Left. In essence, monarchism from 1900 to 1945 was a fringe ideological and political movement in much of Europe that collaborated with fascists against the political Left, with many of its adherents ultimately becoming pawns of the Germans under the Third Reich.

In the early twentieth century, the German Empire, Habsburg Austria, imperial Japan, Ottoman Turkey, and tsarist Russia, while having the trappings of liberalism as concession to their respective elites, retained varying degrees of power for the monarch and the aristocracy, namely in the state bureaucracy, the military, and high government positions. In contrast with the constitutional monarchy of Britain, which ceded much of its political authority to Parliament, these Old Regime monarchies only granted limited representation to their respective citizenries through bicameral legislatures, with major concessions only for the aristocracy and the upper echelons of the middle classes. While greater representation

was in fact granted to the masses, allowing for direct election for representatives in the lower house of the legislature, legislative checks in the upper houses (often dominated by aristocrats) restricted any sort of major social reforms.

With the collapse of the major European monarchies at the end of World War I (the Russian Romanovs, the Austrian Habsburgs, the German Hohenzollerns, and the Ottoman sultans) new republics emerged in their stead. Interwar Europe was characterized by the emergence of the Weimar Republic in Germany and the Soviet Union in the old Russian Empire and the dissolution of Austria-Hungary into its composite states of Austria, Hungary, and Czechoslovakia with some concessions to Poland, Romania, and Yugoslavia. However, in the political and economic instability that characterized the interwar period, monarchist reactionary movements emerged as a response to the liberalization of government, the growing popularity of socialism, and fears of communism. The whites in Russia, Action Française in France, Carlists and Alfonsists in Spain, and segments of the German Nationalist People's Party, among other groups in major European states (Hungary, Portugal, Italy, etc.), supported

the reinstitution of the monarchy as the main agent of the state. Many of these groups also supported other institutions that characterized the Old Regime, such as the church, the aristocracy, and the reverence to these by the masses, while also advocating fervent nationalism, xenophobia, anti-Semitism, and political violence.

The success of fascism, socialism, and to a lesser extent communism in interwar Europe worked against the goals of monarchist movements. In light of their limited numbers and political power, these monarchist movements sought common cause with fascist and authoritarian movements. The monarchist German Nationalist People's Party subsumed itself under the political power of the National Socialist Party in Germany as a means to prevent the rise of communism. In a similar fashion, the monarchist Carlists and Alfonsists in Spain joined forces with the fascist Falange and the authoritarian reactionary Francisco Franco to fight against the Spanish Republicans (anarchists, socialists, communists, and liberals) during the Spanish Civil War (1936–1939). Other movements, such as Action Française (in Vichy France), emerged during the Nazi occupation of much of Europe as active collaborators in their respective puppet regimes, albeit at the whim and direction of their German superiors. These puppet regimes would later be termed quislings after Vidkun Quisling (1887–1945), who headed Norway's government during the Nazi occupation.

Republicanism

In the late nineteenth century, republican forms of government were limited to France in Europe, various South American republics, and the United States in North America. The newest of these was the Third French Republic established in 1870, built on the ruins of the Third Empire of Napo-

leon III at the end of the Franco-Prussian War. Britain was characterized by its constitutional monarchy, and most of the other major European powers retained more authoritarian monarchical systems with limited powers beset for their legislatures. During World War I, most of Europe experienced an increase in the power of the state due to the social and economic mobilization for war. At the war's end, with the dissolution of the Habsburg (Austria-Hungary), Hohenzollern (Germany), and Romanov (Russia) royal houses, new republics emerged in their stead. Poland, Czechoslovakia, Austria, Hungary, the Weimar Republic in Germany, and at least in theory the Soviet Union and its composite republics all added to the map of the world's republics.

In 1911 Chinese revolutionaries deposed the Qing royal house and established the Republic of China, which was based on Western principles while retaining certain cultural characteristics, such as the civil service examinations, of China's long monarchical past. Under the leadership of President Sun Yatsen, the early Chinese experiment with a republican form of government developed into an utter failure given the rife divisions in the country and the factional infighting between warlords, which lasted for decades. With the ascension to power of Jiang Jieshi (Chiang Kai-shek) in 1925 after Sun Yatsen's death as the leader of the Nationalist Party (KMT), the pretense of a democratic republic was dropped as China became an authoritarian state.

Developments in Europe also ensured the end of the nascent republics that succeeded the antebellum Central European empires. The Polish Republic, created in 1919, was ended by the 1926 May Coup of Josef Pilsudski, which established a dictatorship. Austria and Hungary also succumbed to authoritarian governments in the interwar period, given the factional infighting driven by political and economic chaos. Weimar Germany saw its end with the coming to power of Adolf Hitler in 1933. The last of the postwar republics, Czechoslovakia, was absorbed by Nazi Germany in 1938 as the protectorate of Bohemia-Moravia, with its Sudeten region annexed into Greater Germany. The growing authoritarian nature of the Soviet Union under Josef Stalin also removed any pretense of its republicanism during the late 1920s and early 1930s.

World War II led to the destruction of the authoritarian states that had supplanted the short-lived republics instituted at the end of World War I. Following the end of the latter war, areas occupied by the Western Allies were set up with republican forms of government such as the Federal Republic of Germany and the Italian Republic, among others. In areas under Soviet occupation, the establishment of peoples' republics (i.e., East Germany, Poland, Hungary, and Czechoslovakia) also followed, which were republics in name only but were really authoritarian states ruled by national communist parties under Moscow's direction.

Xenophobia

From 1900 to 1945 xenophobia arose repeatedly during times of economic duress and war. Xenophobia, defined as one group's fear of the other, is often equated with tribalism or ethnocen-

trism. While it can embody racism, xenophobia is distinct because it is driven less by a sense of race-based superiority and more by a fear that outside groups will not adapt and may even seek to undermine the predominant culture.

From 1900 to 1945 there were many local and regional forms of xenophobia. For example, after the colonization of Korea in 1910, thousands of Koreans immigrated to Japan, where their culture was disparaged and they were crowded into ghettos in the cities of Osaka and Nagoya. During World War II, Japan utilized more than 600,000 Koreans as forced laborers in factories. In Africa, tribal rivalries that had raged for centuries continued to cause animosity, such as conflict between the Hutu and Tutsi. Often these were exacerbated by colonial policies favoring one tribe over the other. In Belgium, the Flemish ethnic minority faced xenophobic discrimination at the hands of the majority Walloons. Flemish language was not allowed to be spoken in the army or in the national parliament. The multiethnic dual empire of Austria-Hungary created more ethnic tension in the Balkans. Hungary's Magyarization policy stamped out other ethnicities and languages in favor of Hungarian. In both the Austrian and Hungarian portions of the empire, Slavs were looked upon with contempt and suspicion. This hostility led to the assassination of Archduke Franz Ferdinand in Sarajevo in 1914, which triggered World War I. In addition, this time period saw the rise of two global forms of xenophobia: fears of a Zionist Conspiracy and of the Yellow Peril.

Published in a Russian newspaper in 1903, the forged *Protocols of the Elders of Zion* disclosed an imaginary Jewish plot to take over the world. This publication fueled anti-Semitism and pogroms. For example, in April 1903, 45 Jews were killed and another 400 injured in Kishinev, Russia, when violence erupted over the false accusation that a local youth had been killed by Jews. Toward the end of World War I, copies of the *Protocols* made their way to Europe, the United States, and other countries. From Russian peasants to farmers on the American Great Plains to the industrialist Henry Ford, many blamed their woes on an alleged international Jewish conspiracy managed by the Rothschild banking family.

Japanese Americans arrive at the Santa Anita Assembly Center in Arcadia, California, prior to going to a relocation center on April 5, 1942. Following the attack on Pearl Harbor, persons of Japanese ancestry living on the West Coast were required to go to internment camps under Executive Order 9066. (National Archives)

Another common popular form of xenophobia was fear of the Yellow Peril, a phrase coined by Germany's kaiser Wilhelm II. The kaiser and many other Europeans feared that waves of Asians would overrun their nations demographically. In the United States, especially on the West Coast, anti-Asian xenophobia became very strong. Two examples of this fear in the United States include the banning of the immigration of Chinese laborers (1882) and the internment of more than 100,000 Japanese Americans in prison camps during World War II. The fear of many Americans was that the Japanese as well as Japanese Americans living in the United States might act as a fifth-column movement in support of Japan during the war.

The 1920s and 1930s were a time of heightened xenophobia. This attitude was also expressed in international trade as nations built high tariff walls to keep out foreign goods. Many countries, such as the United States and Mexico, closed their traditional open-immigration policies. While Turkey and Greece agreed to mass deportations of more than 1.2 million individuals as one way of reducing long-simmering ethnic tensions in their countries, Filipino and Mexican field workers were deported from California in the 1930s. In addition, various nationalist movements throughout the world drew their support and existence from xenophobia, including the Ku Klux Klan in the United States, the Muslim Brotherhood in Egypt, the fascist movements of Southern and eastern Europe, and the communists of China.

In its worst form, xenophobia led to outright attempts at extermination. During World War I, the Ottoman Turks allegedly murdered almost one million ethnic Armenians. Years later the rise of Nazi Germany became the most horrific example of violent xenophobia, as Adolf Hitler blamed the German Jews for the loss in World War I and the unfavorable terms of the Treaty of Versailles. He also linked the Jews to the communist movement. The Nuremberg Race Laws (1935) restricted the rights of German Jews, and four years later the Nazis confined Jews to ghettos. The Final Solution, as the Nazis called their plan to exterminate the Jewish race, led to the deaths of more than six million Jews during the Holocaust, with another six million Slavs, homo-

sexuals, Catholic clergy, and Gypsies also being murdered.

Social Democracy

The term "social democracy" describes those movements and parties that beginning in the latter half of the nineteenth century aimed to achieve the democratic aspirations of the revolutions of 1848 and to transform the industrial-capitalist order into a socialist one. As parliamentary government and industrialization spread, social-democratic parties and trade unions arose throughout Europe and were linked together in the Second International, headquartered in Brussels after 1903. Eventually they were established in most of the world's nations.

By 1900, a simplified or vulgar version of Marxism dominated social democracy's ideological outlook and consisted of three core propositions. First, the wage relation between capitalists and workers is unfair and allows the former to exploit the latter through the extraction of surplus value in the production process. Second, history proceeds in stages in which each is characterized by a specific economic system dominated by a particular class. Thus the capitalist order, like earlier ones, was a transient historical phenomenon, which would be replaced by socialism. Third, workers are a fundamentally homogeneous class united by similar interests. In order to improve their day-to-day condition, resist efforts to divide them, and ultimately overthrow capitalism, they had to organize into political parties and trade unions. In the context of Europe's industrial transformation, this form of Marxism attracted substantial numbers of workers, artisans, and elements of the middle classes.

It was the German Social Democratic Party (Sozialdemokratische Partei Deutschlands, SPD) that led the way. Founded in 1875 through the merger of the reformist Allgemeiner Deutscher Arbeiterverein (General Association of German Workers) and the more radical and Marxist-oriented Sozialdemokratische Arbeiterpartei (Social Democratic Workers' Party), the SPD emerged from more than a decade of illegality as a powerful mass party in 1891. The SPD's *Erfurt Program*, drafted in that year by Karl Kautsky and Eduard Bernstein, provided a Marxist analysis of capitalist development, called for the socialization of the means of production, and set forth a range of practical demands to empower workers and improve their condition. The program served many other parties as a model and was one of the most widely read socialist texts.

Between 1903 and 1912 the SPD's dues-paying membership increased from 300,000 to more than 1 million, while from 1891 to 1912 its share of the vote rose from 20 percent to almost 35 percent. This growth rested on the SPD's ability to reach out to workers with its ideas and to draw them into the party's organizational and electoral network. Many European parties, such as those in Austria, Belgium, Denmark, Finland, Sweden, and Italy, emulated the Germans' success, but others, such as the French, were less effective due to organizational and ideological divisions. In a few places, such as Great Britain, social democracy remained a relatively minor movement until after World War I.

As social democracy grew, it faced a number of interrelated practical and ideological problems. Most important among the former was the issue of whether the parties should focus on electoral or nonelectoral (i.e., revolutionary) means to bring about change. Social democrats agreed that the movement needed to take advantage of the parliamentary arena in order to attract new supporters and work for reforms, but many also opposed cooperating with bourgeois parties or entering into governing coalitions with them. Leaders on the movement's left, such as Rosa Luxemburg, urged less focus on elections and more on extraparliamentary strategies to build a revolutionary consciousness among the workers. Inspired by the Russian Revolution of 1905, they promoted such tactics as the political mass strike,

an option that met strong opposition among party and trade union leaders. Having worked for years to build their organizations into an effective means of winning votes or bargaining with capital, they regarded radical actions such as political strikes as a threat to their hard-won gains. By 1914 such views dominated the leadership of many parties across Europe.

The two decades preceding World War I also witnessed the revisionist challenge to Marxist theory within social democracy. Led by Eduard Bernstein, the revisionists argued that actual historical experience had undermined many of Marx's conclusions about the future of capitalist development. The social structure was not becoming more simplified, as he had expected, but more complex. Small- and medium-sized enterprises were not disappearing but continued to exist, and the middle classes were expanding, not shrinking. Instead of growing more intense, capitalist crises were diminishing, and there was strong evidence that workers' living standards were not falling but instead were rising. The revisionists rejected the overthrow of capitalism and the establishment of socialism through violent revolution. Instead, they called on the party to drop its revolutionary pretensions and to continue its *de facto* strategy of reform largely, though not exclusively, through electoral politics and the formation of coalitions with bourgeois parties if it advanced the cause. For revisionists, socialism was a continuing process rather than a particular condition; it resulted from a moral imperative and not historical necessity.

Prior to 1914, the parties of the Second International officially and often heatedly rejected revisionism, but over the next half century it became the movement's dominant outlook. The decision by most social democratic parties to back their respective governments' decision to enter World War I revealed reformism's strength among party leaders, who hoped that such a step would open the door to fundamental democratic and social reform. This collaborationist policy, however, turned socialist internationalism on its head and split the reformist and radical wings of the prewar movement. Following the victory of Bolshevism in Russia, the radical minority gravitated toward the newly founded communist movement.

This division weakened the workers' movement and created a powerful rival to social democracy's Left, but it also eased the latter's adoption of an avowedly reformist strategy. During the interwar years social democratic parties throughout Europe pursued a wide range of political and economic reforms within the framework of parliamentary democracy. Debates about social democracy's identity, the role of class struggle, coalition politics, the extent of planning, and the meaning of socialism continued, but of overriding importance was the movement's commitment to democracy and its rejection of authoritarianism. Following the period of fascist hegemony between 1933 and 1945, social democracy resumed its evolution away from its Marxist, working-class origins to become a movement that was more ideologically and socially diverse.

Zionism

Anti-Semitism, a guiding influence for the formation of modern Zionism, was on the rise in Europe after the depression of 1873. Many Jews, because of their ties to finance and business, received much of the blame for this depression. Lasting until 1896, this depression fostered a new kind of anti-Semitism, one that European Jews could not escape through conversion or assimilation. This racial anti-Semitism was given distinct expression in the pogroms that followed the Russian tsar Alexander II's assassination in 1881 in which a young Jewess was involved. These pogroms, the most intense of which oc-

curred from 1903 to 1907, and the anti-Semitic tsarist policy made it clear that the dismal condition of the Russian Jews would continue.

During the intense period of pogroms, the bloodiest pogrom to date occurred in Kishinev in 1903. Stirred on by the accusation of a blood libel, mobs killed and wounded many Jews, burned their houses, and looted their shops. Jewish cries of outrage were heard, and money was sent to the Russian Jews for relief, but there was another response to this pogrom. Stirred by the poet Hayyim Nahman Bialik's "In the City of Slaughter" (1903), which castigated the Jews at Kishinev for their cowardice, Russian Jews defended themselves in the next pogrom at Gomel in 1903 as well as the pogroms that followed until 1907.

Many of the defenders included socialist Jews. Since the Russian industrial proletariat organized in the 1880s and 1890s, Jewish socialism arose as well, specifically through the organization of the

➤ AHAD HA'AM

Ahad Ha'am (1856–1927), whose given name was Asher Hirsch Ginsberg, was the leader of the cultural, or spiritual, Zionist movement that opposed Theodor Herzl's political Zionism. Born near Kiev in the Ukraine, Ha'am was raised in a Hasidic tradition, which he later rejected. He did not, however, abandon his connection to Jewish culture. He carried this connection into his work with the Hibbat Zion (Love of Zion) movement but criticized the movement for focusing too much on settlement activities (that is, practical Zionism) and not enough on Jewish cultural development and preservation. In 1899, within the Hibbat Zion movement, Ha'am formed the B'nai Moshe (Sons of Moses), which established several schools and libraries to encourage Jewish cultural preservation. However, this group was established after cultural aims were officially adopted by the Zionists in 1898 and after the First Zionist Congress in 1897, which Ha'am attended as a visitor. At this congress, he characterized Herzl's Zionism as European, not Jewish, and therefore found it inadequate for the diverse peoples of the Jewish Diaspora in need of a state. Ha'am's point was that without a culturally united people, a political state could not survive.

—James M. King

Chaim Weizmann was an accomplished scientist who worked tirelessly to advance the Zionist movement. His effort brought the momentous Balfour Declaration by Britain, which was crucial in the emergence of the nation of Israel. (Library of Congress)

General Association of Jewish Workers in Russia, Poland, and Lithuania (Bund fun Yidishe Arbeter in Rusland Poyln un Lite, or Bund for short). Many of its activists came from underground revolutionary movements and returned to their Jewish origins because of the pogroms. They were not socialist Zionists, however, for the Bund activists rejected Zionism as bourgeois and utopian; socialist Zionism arose in 1898 with Nahman Syrkin (1868–1924) and the Poale Zion organization (1905), specifically urging a socialist settlement in Palestine. The main task of the Bund, in contrast, was to organize workers against the tsarist regime.

Despite their forged self-defense, many Jewish revolutionaries left for the United States after the failed Russian Revolution of 1905 or turned to the political Zionism established by Theodor Herzl (1860–1904). Herzl, from a wealthy, assimilated, and politically liberal German Jewish family in Austria-Hungary, had only a limited knowledge of Judaism. Stirred by the anti-Semitic atmosphere festering in Europe, specifically with the election of an anti-Semitic mayor in Herzl's home of Vienna, Herzl began seriously considering the Jewish question. His ideas were expressed in his *Der Judenstaat* (*The Jewish State*), published in 1896. For the next few years, Herzl devoted himself to the Zionist cause until his death, arguing that anti-Semitism was inevitable regardless of where the Jews lived. Although the idea of a Jewish state was not new, Herzl's method, organization, and political goal certainly were. The solution, for Herzl, was no longer simply about settlement and colonization, as it had been for the practical Zionism of the Hibbat Zion (Love of Zion) movement, but gain-

ing a charter for a Jewish settlement that was internationally recognized. Later, the Hibbat Zion movement accepted Herzl as its leader, and with this additional support he was able to establish the First Zionist Congress and the World Zionist Organization (WZO) in 1897.

The organization, however, was not entirely unified. As stated above, there was the rise of socialist Zionism and practical Zionism, but the most challenging opponent to political Zionism was Ahad Ha'am (1856–1927) and his cultural, or spiritual, Zionism. Ha'am and his followers were suspicious of Herzl's purely political solution and encouraged the cultivation of and familiarity with Judaic heritage and values. This division—usually, but not completely, between political West European Jews on one side and tradition-based East European Jews on the other—was exacerbated by the Uganda scheme. After an unsuccessful attempt to enlist German help, Herzl managed to secure the aid of Britain, which in 1903 offered Uganda as a place for Jewish settlement. While Herzl only saw this as a temporary solution for immediate relief from the Russian pogroms, the proposal angered many Eastern Jews who insisted on settlement only in Palestine.

After Herzl's death in 1904, synthetic Zionism arose as the guide for the WZO with Chaim Weizmann, the first president of Israel, at the helm. This kind of Zionism advocated simultaneous political, cultural, and practical activity in Palestine. It also stressed Zionist activity in the Diaspora, or *Gegenwartsarbeit* (work of the present), which encouraged such things as modernizing Jewish education, providing clubs for the young, and participating in elections.

Zionism had already become a recognized political force by the time of World War I. As a result, the competing powers had to take Zionist influence under consideration. This influence led to deliberations with the British government that resulted in the Balfour Declaration (1917) through which Britain recognized a national home for Jews in Palestine. The British issued this declaration in hopes of winning U.S. Jewish support, thereby influencing the decision of the United States to enter the war and to keep Russia in the war after the Revolution of 1917 by also appealing to its large Jewish population.

The Balfour Declaration placed British support behind Jewish migration to Palestine, but the Arabs argued that this declaration encroached on Arab rights and thus insisted that only a small Jewish population be allowed to settle in Palestine. As the overall Jewish circumstances were worsening in Europe, especially with the rise of Adolf Hitler in Germany, more people viewed mass migration as the most immediate solution. As a result, conflict often broke out between Jewish settlers and local Arabs. There was a proposal issued by the Peel Commission (1936) involving the partition of Palestine, but the Arabs rejected the proposal, and the British White Paper (1939) further weakened the Jewish position by limiting migration to 75,000 people.

The knowledge of the Holocaust, uncovered by the Allies during World War II, led to a radical step by the Zionists. Encouraged by David Ben-Gurion (1886–1973), the Zionists issued the Biltmore Program (1942), a document that stated that the Jews were no longer going to depend on British assistance to establish a Jewish state but instead would invest their energies in the Jewish Agency—a prestate Jewish government—and in the Jews themselves. The end of the war only saw Jews become more outraged at the atrocities committed against them and led, in 1947, to a debate in the United Nations on the future of Palestine. The result was a partition of Palestine, much like the Peel Commission had proposed, but the Jews took a further step and formally declared the formation of the State of Israel on May 14, 1948.

The Welfare State

The term “welfare state” usually refers to a government that advocates public authority for the social and economic welfare of its citizens. Such

governments base their actions on the principles of equality of opportunity, equitable distribution of wealth, and public responsibility for those who cannot care for themselves. For most of human history, people have relied on their families or their churches to assist them; only in nineteenth-century western Europe did the idea take hold that national governments might extend their services in those ways. Welfare states saw their most dramatic expansion following World War II, but in recent decades they have come increasingly under attack.

The ideas that gave rise to welfare states envisioned no radical restructuring of society, as did the more radical ideologies of socialism and communism, which also called for state planning and a more equitable distribution of resources. The goal of welfare states was to maintain social stability by softening the worst extremes of poverty. The origins of the welfare state were tied to industrialization and the ability of large numbers of organized industrial workers to protest their exploitation and to disrupt economic growth in the process.

The first of the great welfare states was created in the German empire by Otto von Bismarck in an attempt to lure the working class away from socialism. Bismarck attempted to crush the socialists through repression, but his government also instituted a system of social insurance against accidents, illness, old age, and unemployment that was years ahead of any other European nation.

The more common pattern among west European governments was to gradually expand the basic services necessary to sustain an industrial workforce. The most important of those services was education, and beginning in the 1870s Great Britain and other nations began to extend free primary schooling throughout their countries. (Education remains a central element in the welfare state; education through university levels is provided free in France and Scandinavia today.) In the late nineteenth century governments also began to seek greater control over sanitation and health concerns especially in the great cities, where epidemic disease and tuberculosis were rampant. The inspection of factories and the financing of charity hospitals became standard government responsibilities.

The next great turning point for the welfare state occurred in England in the early twentieth century. There the British Conservative Party had long defended the great landowners; the British Liberal Party had advocated free trade, individualism, and industry; and the British Labour Party was just beginning to organize around socialist demands. The Liberals sought to preserve their electoral edge against the nascent Labourites by abandoning their dependence on laissez-faire doctrine and intervening in the nation's economic policy. Between 1906 and 1916 Prime Minister H. H. Asquith and Chancellor of the Exchequer David Lloyd George created social insurance against illness, accidents, old age, and some types of unemployment. The government passed a moderate minimum-wage law, created employment bureaus, and lifted the restrictions against labor strikes.

Most strikingly, the British government financed those measures partly through progressive income and inheritance taxes. Taxes are called progressive when those with higher incomes are taxed at a higher rate. The idea that tax policy could be used to modify extremes of wealth and poverty was very novel and was strongly resisted by conservatives almost everywhere. Other forms of positive state intervention also developed. Though France, for example, enacted some programs similar to those in Britain, its government placed less overall emphasis on male workers and more on families. Support to working women and mothers was always more pronounced in France, where the welfare state evolved to provide cash-payment support on a per-child basis to large families of every class.

In the United States, ideologies based on individualism and competition remained more popular than ideas about social assistance among lawmakers. Although such leaders as Theodore Roosevelt and Woodrow Wilson recognized that organized labor and mergers among big businesses had undermined fair competition between individuals in the U.S. economy, they hesitated to support any rights for workers and sought to restore competition through antitrust actions.

It was only during the desperate years of the Great Depression that the U.S. government was able to take on some of the characteristics of the strong central governments in Europe and insti-

tute social programs. Under the guidance of Franklin D. Roosevelt and his New Deal, the U.S. government took measures to reactivate the economy, extended assistance to farmers and industrial concerns, and legislated some kinds of social insurance. Aid to poor families, however, was not set up as a social insurance program like unemployment insurance or Social Security but rather as a cash-payment relief program that stigmatized its recipients. The resulting Aid to Families with Dependent Children (AFDC) was always a despised program but did not create controversy as long as most of its beneficiaries were white.

While the Great Depression had encouraged governments throughout Europe—and especially in Scandinavia—to intensify welfare measures, it was World War II that produced the most dramatic expansion of government responsibility for the well-being of the population. For one thing, the necessities of total war had greatly expanded the power of central governments in such areas as planning and industrial intervention. For another thing, European governments felt the need to reward the poor in their countries for the loyalty they had shown during the war and the hardships they had suffered.

The Labour government in Great Britain led the way in 1948 by extending social insurance and enacting a comprehensive national program of free medical care. In addition to extremely progressive taxes, the government sought to guarantee the rebuilding of the British economy by securing public ownership of the Bank of England, public utilities, coal mines, communications, and the iron and steel industries. Those nationalizations still left four-fifths of the British economy in private hands, which qualified it as a mixed economy rather than a socialist one.

■ Introduction: Social and Behavioral Sciences

The terms “social science” and “behavioral science” are used to describe a variety of academic disciplines that use scientific methods to understand and explain individual behavior, group behavior, social structure, and culture. The term “social science” is used more broadly to refer to academic disciplines that focus on larger patterns, social institutions, or historical trends (e.g., sociology, anthropology, history, or economics). The term “behavioral science” is used to refer to academic disciplines that focus on direct observation or experimentation to investigate the causes that influence the behaviors of individuals and groups (e.g., psychology). Despite these distinctions, the disciplines share an intellectual heritage, and there is a great degree of overlap between them, especially in the use of the scientific method to understand and explain individual and group actions as they are influenced by social and cultural environments. Further, given the complexity of their subject matter, it is common for these disciplines to share an interest in both individual behavior and broader social patterns, although research may differ along disciplinary lines and levels of analysis.

While some of the social and behavioral sciences trace their intellectual roots to ancient philosophies, the primary influences on their intellectual traditions are found in the works of Enlightenment philosophers such as Jean-Jacques Rousseau, John Locke, and David Hume. One of the most important influences of Enlightenment thinking on the social and behavioral sciences was the position that scientific understanding of the natural world and social phenomena was superior to the knowledge produced through religious teaching, which was dominant prior to the eighteenth century. The successes of the natural sciences in particular led many Enlightenment thinkers to turn to science not only as a way to understand society but also to improve it. They believed that an empirical understanding of problems such as disease, inequality, famine, and the acquiescence to traditional forms of authority might help in the transformation of social institutions; thus they promoted equality, freedom, and

emancipation from religious or superstitious thought. In addition, they felt that the use of science and reason would not only provide the basis for objectively identifying problems but also would legitimate the required changes.

Throughout the nineteenth century, the Enlightenment ideals of scientific understanding were developed more fully as a basis for the study of both individuals and societies. For example, advances in understandings of the brain and the nervous system would lead to the theories of Johannes Muller (1801–1858), Herman von Helmholtz (1821–1894), and Wilhelm Wundt (1832–1920), which laid the foundations of psychology. Likewise, theorists such as Auguste Comte (1798–1857) laid the groundwork necessary to add rigor to the application of scientific methods to new fields through his elaboration of positivism. Comte’s work would go on to influence Herbert Spencer (1820–1903), Edward Tylor (1832–1917), Lewis Henry Morgan (1818–1881), and Emile Durkheim (1858–1917) in both anthropology and sociology. Further, the work of Karl Marx (1818–1883) and later in the nineteenth century the work of Sigmund Freud (1856–1939) became so influential that many schools of thought in the behavioral and social sciences remain influenced by them to this day. As a consequence of these developments in theory and method, more opportunities arose for students to receive specialized training in a growing number of graduate programs, and the disciplines began to diverge and professionalize.

The late nineteenth and early twentieth centuries marked a period in which the American social and behavioral sciences experienced a great deal of intellectual development that distinguished them from the European progenitors. For example, the pragmatism of Charles Sanders Pierce (1839–1914), William James (1842–1910), John Dewey (1859–1952), and George Herbert Mead (1863–1931) would not only serve as the foundation of a uniquely American school of philosophy but would also provide the foundations for functionalist psychology and symbolic interactionism in sociology. The behaviorism of John Watson (1878–1958) also served as a foundation for symbolic interactionism as well as social

exchange theory later in the twentieth century. In both instances, there is a focus on the practical nature of problem solving and finding meaning in the world for these emergent American variants of social and behavioral sciences. These approaches became the basis for an emphasis on not only theoretical and empirical work but also application of the findings to the experiences of individuals in their daily lives. As an outgrowth of this tendency to focus on the practical, American social sciences began to develop subspecialty areas that focused on application in real-world settings (e.g., industrial psychology, social psychology), thus leading to the growth of private- and public-sector jobs for practitioners of the social and behavioral sciences.

From the early twentieth century to the present, the social and behavioral sciences have continued to evolve in response to major social, political, and economic events. World War I and World War II, for example, increased the demand for psychologists qualified in statistical testing and assessment. Immigration, changes in population composition, issues of socioeconomic inequality, and issues of racial prejudice gained the attention of sociologists wishing to understand emerging social problems. The maltreatment of indigenous populations and exposing cultural prejudices became the province of anthropology. At present, the social and behavioral sciences continue to grow more sophisticated in the knowledge produced through increasingly complex methods and refinements in theory.

—Sean Huss

Anthropology

Anthropology is the study of mankind. Although today anthropology is rarely considered a “hard” science, it has a strong scientific tradition. In the nineteenth century, anthropologists adopted methodologies that enhanced the scientific status of their findings. Skull measuring and brain weighing, for example, for a time lent some credence to claims, made by French anthropologist Paul Broca (1824–1880) and others, about the cognitive superiority and inferiority of different races. Much of the influential work in anthropol-

ogy dealt with racial classification, and anthropology became an important tool for the apologists for slavery in the United States prior to the Civil War. British anthropologist Edward Tylor (1832–1917) helped to codify an intellectual school of thought, evolutionism, which focused on the development of mankind’s civilization through stages. He believed these stages were universal across cultures, but each of the world’s peoples existed at a different level. This outlook reinforced preexisting racial attitudes of superiority and inferiority. Because research indicated a wide variety of influences on human societies, however, such as totemism, sexuality, and kinship, early-twentieth-century anthropologists such as William H. R. Rivers (1864–1922) tried to augment evolutionism with “diffusionism,” noting the separate paths taken by disparate peoples because of differing social structures.

Anthropology became the leading social science, a term used to describe fields that explore human society with some methodological tools borrowed from the natural sciences. In the 1920s, a number of anthropologists were dissatisfied with the historical approach of both evolutionism and diffusionism because of its inherently conjectural nature and argued for a view based on more stringent methodology. The result was functionalism, and its leading adherents were British anthropologists Bronislaw Malinowski (1884–1942), Polish-born, and Alfred R. Radcliffe-Brown (1881–1955). Malinowski was particularly keen to make anthropology a strictly empirical science, inspired by the positivist philosophy of Ernst Mach (1838–1916). Functionalism implied that all aspects of society have a purpose that is integral to the whole, and these aspects can be identified and perhaps even quantified to gauge their importance to the whole. Malinowski’s other influences included sociologist Émile Durkheim (1858–1917) and psychologist Sigmund Freud (1856–1939), from whom he learned about the importance of social and cultural practices and the individual’s internalization of cultural norms. The functionalists emphasized rigorous data collection, requiring extensive fieldwork such as Malinowski’s in New Guinea. More than ever before, anthropologists were obligated by their professional standards to leave the comfort of their homes and universities and

➤ MARGARET MEAD

Margaret Mead (1901–1978) was one of the most well-known anthropologists of the first half of the twentieth century. Her work helped to transform thinking about gender roles, sexuality, and the importance of culture in defining social behavior. She did more than any other anthropologist to extend Franz Boas's (1858–1942) cultural deterministic views. She also worked to popularize her findings, making herself a widely recognized scientific celebrity. Mead traveled extensively during her career, including expeditions to Samoa and New Guinea, where she conducted her most significant fieldwork. She held a position in the Department of Anthropology at the American Museum of Natural History from 1926 until her death.

Mead's mentor, Boas, was an ardent supporter of seeing differences in human populations in terms of environmental and social influences, rather than taking a purely biological (i.e., genetic) approach. Mead's work also reflected this willingness to explore culture as a major anthropological force. Her doctoral research required her to travel to the Manua Islands, in American Samoa, for nine months in 1925–1926, where her observations provided her with evidence that certain phases of human development were culturally, not biologically, determined. In particular, Mead noted that the tumultuous years of adolescence, often thought to be universal, were a cultural by-product resulting from trying to suppress or hide sexuality. She generalized that Samoan culture was casual and easygoing, lacking many of the aggressive

tendencies found in Western cultures. In general, she criticized notions that characterized emotions and other behaviors as universal across cultures. Her work became a powerful argument for an emerging group of anthropologists who embraced cultural determinism.

Mead continued to travel and conduct fieldwork among island peoples in the late 1920s and 1930s. She published *Growing Up in New Guinea* in 1930, and eventually published more than forty books, some of which emphasized the transmission of culture to children and the roles of women in different cultures. For example, she found that, in the Tchambuli culture of New Guinea, the men (not women) were in charge of the household. Mead's books raised provocative questions about the organization of society, particularly in gender roles.

Other anthropologists occasionally disagreed with Mead's observations. Some have attempted to debunk Mead's entire body of work on the grounds that she was biased. Anthropologist Derek Freeman dedicated part of his career to demonstrating that Samoans were more violent and troubled than Mead acknowledged. He observed that Mead simply found in Samoa the results that her mentor wanted to find; in other words, Boas's deep-held cultural determinism spoiled Mead's objectivity.

Mead became active in national and international bodies in later years. She received many honors for her work, including nearly thirty honorary degrees. Mead died of cancer in 1978.

—Jacob Darwin Hamblin

to travel to the areas they studied and encounter the peoples they analyzed. The impulse to ensure proper “scientific” bases for subjects beyond the natural sciences is often called scientism, and it had a pervasive influence among anthropologists in the twentieth century.

Why did this change from evolutionism to functionalism occur? One reason was certainly tied to the anthropologists' own influences, as in the case of Malinowski. Another was patronage. Funding organizations such as the Rockefeller Foundation provided money for research more readily when the research had sound methodological foundations. In other words, anthropol-

ogy needed a rigorous, scientific basis to acquire funds for fieldwork. Functionalism asserted precise roles for every aspect of society. Malinowski was skilled at arguing that anthropological research would be of practical benefit to colonial regimes. One important result of this change in anthropologists' attitudes (functionalism replacing evolutionism) was in social control. Evolutionism had emphasized the ranking of different races in a hierarchy of civilization, providing a rationale for imperialism. Functionalism drew out the structures of indigenous cultures, including nascent political relationships, allowing imperial powers (especially the British, where the

anthropologists were particularly influential) to understand local institutions and to permit and encourage some degree of autonomous rule.

Probably the most influential of all twentieth-century anthropologists was the German-born American Franz Boas (1858–1942), who was an ardent critic of racial determinism. Boas conducted fieldwork in Canada upon the Kwakiutl, an indigenous tribe. He became convinced that social and even physical differences in peoples resulted not from biological necessity, but rather from a combination of historical, geographic, and social factors, which gave rise to unique cultures. Most of cultural anthropology owes an intellectual debt to Boas, who insisted that culture was the dominant influence on individuals. Cultural anthropology struck a blow against universalism; it asserted that societal differences are not racially determined and have nothing to do with any “stage” of civilization; instead, they are a product of the specific cultural environment into which individuals are born and raised. Some of the most prominent anthropologists were disciples of Boas, including Ruth Benedict (1887–1948) and Margaret Mead (1901–1978)—both of whom tried to shatter universalist notions. Mead, for example, asserted that what most Westerners thought were normal, natural experiences of adolescents were absent in some populations in the Pacific region. Though some of Mead’s findings later were questioned seriously, the outlook of cultural anthropology became a particularly “American” tradition by mid-century.

Sociology

Sociology, the scientific study of large-scale and small-scale human social action, structure, and organization, originated in Europe during the early nineteenth century in response to the dramatic intellectual, political, economic, and technological transformations that created the modern social order. The decline of traditional religious and political authority, industrialization, and urbanization offered the potential for social disintegration just as they offered opportunities for greater individual liberty, wealth, and societal progress. Early sociological thinkers such as Auguste Comte (1798–1857) and Herbert Spencer (1820–1903) sought to establish a science of sociology to study the laws that governed the evolution of human societies as a means to facilitate stability and consensus in modern societies. In the late nineteenth century, Emile Durkheim (1858–1917) contributed to the greater methodological sophistication of the discipline by elaborating guidelines for conducting sociological research and specifying the proper subject matter of sociology (*The Rules of Sociological Method*, 1895). Furthermore, Durkheim demonstrated the sociological perspective in his analysis of how social organization (as opposed to psychological factors) influences suicide. Sociology also gained a foothold in the United States in the late nineteenth century, as scholars such as William Graham Sumner (1840–1910) and Lester Ward (1841–1913), influenced by the work of Spencer and Comte, sought to identify laws that governed societal evolution in order to prevent the United States from following the path of social conflict, poverty, and even revolution that had beset European societies (particularly France and Britain).

At the beginning of the twentieth century, several key intellectuals helped to further distin-

guish sociology from other social scientific disciplines, in the process contributing to its greater theoretical and methodological complexity. In Germany, Max Weber (1864–1920) produced an extensive body of historical and comparative analyses of religions, economic systems, legal and political systems, and other institutions. Weber's emphasis on value-freedom (i.e., objectivity) with regard to teaching and conducting sociological research, his focus on social action as an object of study, and the sheer breadth of his analyses of multiple institutions across various societies made him one of the most influential scholars for the development of sociology in Europe and the United States. While Weber focused on large-scale analyses of social structure, Georg Simmel (1858–1918) focused more on forms of small-scale group interaction, such as the dynamic changes in social roles prompted when a two-person group becomes a three-person group, as well as an examination of social types (e.g., the poor, the stranger, the miser) to reveal the system of interactions and role expectations composing everyday life. Simmel's work would influence later theoretical developments in the United States, particularly the theory of symbolic interactionism.

As Weber and Simmel were gaining notoriety in Europe and abroad, Sociology was developing into a distinct discipline in the United States. By 1892, one of the discipline's earliest and foundational departments was founded at the University of Chicago by Albion Small, who later helped to establish the American Sociological Society (currently the American Sociological Association) in 1905. The "Chicago school," as the department came to be known, was dominant in the field due in part to the extensive empirical research produced by the department in the early twentieth century. In 1918, W. I. Thomas (1863–1947), along with Polish philosopher and nationalist Florian Znaniecki, published *The Polish Peasant in Europe and America*, a product of eight years of research using a host of data sources, including autobiographies and personal documents. The focus on the city as an object of analysis, and the integration of racial and ethnic minorities into dominant society, were also hallmarks of the Chicago school due primarily to the work of Robert Park (1864–1944). One of Park's more significant

contributions to the field was his concept of the race relations cycle, which would influence the elaboration of assimilation theory in the 1960s. However, the greatest theoretical contribution of the Chicago school would come from philosopher George Herbert Mead (1863–1931) and sociologist Herbert Blumer (1900–1987), whose emphasis on the origins of meaning created and re-created through the process of everyday interaction would later become the core social psychological theory of symbolic interactionism.

In the 1930s, the influence of the Chicago school declined, while scholars at Harvard and other elite eastern U.S. universities advanced a theoretical perspective that would become dominant in U.S. Sociology into the 1960s: structural functionalism. This perspective, initially developed in the United States through the work of Talcott Parsons (1902–1979), could be traced back to Durkheim, Comte, and Spencer (among others) and their emphasis on consensus and the maintenance of social cohesion or solidarity. Parsons' analysis of social structures as striving toward a dynamic equilibrium was remarkably similar to Spencer's metaphor of society as an organism, in which parts of the organism are interdependent on one another, and work together to maintain the system as a whole. Taken to its logical conclusion, social inequality was ultimately essential to the stable functioning of society—a conclusion explicitly asserted by structural functionalists in the 1940s.

Though the thrust of sociology in the United States was predominantly conservative from the late 1930s to the 1950s as the intellectual center of sociology shifted to the eastern Ivy League universities (particularly Harvard), there were radical theorists such as C. Wright Mills (1916–1962) who produced works such as *The Power Elite* (1956) that sparked the development of conflict theory. In addition, a coalition of Marxist theorists known as the "Frankfurt school," so named because the school started as an institute in Frankfurt, Germany, in 1923, resided in the United States at Columbia University from 1934 to 1949 due to pressures from the National Socialist regime. During this period, intellectuals of the Frankfurt school integrated the theoretical work of Weber with that of Karl Marx (1818–1883), moving from a doctrinaire emphasis on

the economy to the study of culture as a central force maintaining subordination. By the 1960s, structural functionalism began to lose its dominance while conflict theory, feminist theory, and radical race relations theory began to emerge in light of social upheaval.

Psychoanalysis

Although physicians studied mental disorders such as hysteria in the late nineteenth century, modern psychoanalysis began with Sigmund Freud (1856–1939), who published *The Interpretation of Dreams* in 1900. Freud determined in the late nineteenth century that many mental problems, which he routinely saw through his own private practice, were connected to conflicts residing in the unconscious mind. He and his colleague Josef Breuer (1842–1925) had conducted hypnosis experiments that seemed capable of bringing to light forgotten memories in patients, which had the cathartic effect of occasionally ending the neurotic behaviors simply by making the patient conscious of their probable origins in a memory from the distant past. Although Freud had some success with hypnosis, he believed that analysis of dreams and fantasies could help bring these problems to light by moving them from the unconscious to the conscious mind. Hallmarks of psychoanalysis were concepts such as the repression of memories and the sublimation of erotic or aggressive instincts, that is, channeling them in other ways such as through art or music. The purpose of psychoanalysis was to understand how the mind interacts with itself and with the environment, often creating mental problems (neuroses).

By the early 1920s Freud had refined his version of psychoanalysis. In his effort to create a

new science of the mind, he developed a conception of mental dynamics based on fundamental human instincts: Eros and Thanatos, or life and death. The life instinct tended toward self-preservation and sexuality, driven by the libido (sexual energy). The death instinct was the cause of self-destructive or aggressive behavior. These instincts made up the id that was balanced by the superego, which reined in one's instincts because of norms of behavior acquired from external influences (such as moral values learned from parents or teachers). The conscious mind, the ego, was a product of these two forces in tension.

Although Freud's emphasis on sexuality, the overarching motivation of the life instinct, scandalized some scholars, psychoanalysis provided a tool to engage neuroses in a scientific way. Critics of Freud were taken aback by his willingness to ascribe human character to the development of the libido, which gave a paramount importance to erotic impulses. Yet the systematic analysis of dreams and memories had great appeal to physicians and psychiatrists—and patients—for whom strictly physiological studies had provided little aid in a clinical setting. Freud's ideas attracted numerous scholars in Europe and North America; the first International Psychoanalytical Congress took place in 1908 in Salzburg, Austria, which facilitated the discipline's spread.

Psychoanalysis became popular in the United States after 1909, when Freud and his protégés Alfred Adler (1870–1937) and Carl Jung (1875–1961) were invited to lecture at U.S. universities. One scholar has argued that somatic (body-oriented) approaches to mental disorders had reached a crisis point among many U.S. psychologists, and Freudian psychoanalysis established a new paradigm of thinking about the nature of neuroses and how to treat them. In Russia, psychoanalysis took root among intellectuals and thus was widely appreciated by early revolutionaries such as Leon Trotsky. Under Josef Stalin (1879–1953), however, psychoanalysis was condemned because of its focus on the past. Stalin and other Soviet leaders believed that the implicit belief that the past inescapably shapes one's life forever challenged communist ideology in the sense that it seemed to deny the pos-

sibility of radical improvement or change in behavior. Accepting the possibility of such changes was crucial to ensuring the life of the Soviet state. Psychoanalysis itself acquired a reputation as a degenerate, immoral philosophy inextricably tied to Western capitalism.

Despite Freud's foundational work, psychoanalysis evolved in others' hands. Both Adler and Jung, for example, broke with Freud. Jung became renowned for his theories of collective unconscious memories, or archetypes. Like others, he was disturbed by Freud's emphasis on sexuality, which Jung viewed as a potentially destructive instinct. Jung founded analytical psychology in the second decade of the twentieth century, breaking with Freudian psychoanalysis.

The creation of psychoanalysis continues to be controversial. Freud initially believed that most neuroses, especially in women, were a result of repressed memories of trauma, specifically sexual assault during childhood. However, he later revised his view, claiming that unconscious memories were only part of many elements of the unconscious, of which fantasies also played a crucial role. One author, J. M. Masson, has made a controversial claim that Freud in fact made an important discovery—that child sexual abuse was far more prevalent than anyone realized—but the negative reactions of his peers convinced him to abandon his premise. However, psychoanalysis ultimately embraced far more than repressed memories or even fantasies; it studied desires, guilt, shame, paranoia, aggression, self-loathing, and a host of other instincts and learned values that, according to psychoanalysis, underpin the conscious self.

Behaviorism

Behaviorism was a primarily American philosophy that deemed the scientific study of behavior to be the purpose of psychology. The movement developed in response to the subjective metaphysics that defined earlier psychology. Soon after John B. Watson (1878–1958) first used the term "behaviorism" in an article for the *Psychological Review* (1913), this movement came to dominate the field of psychology in the United States. While those who accepted Watson's title never followed a common creed, they were united in their rejection of the metaphysical in favor of a scientific psychology of experiments and practical applications.

Originating from psychology's roots in Western philosophy and the Christian religion, metaphysical psychology remained the discipline's dominant paradigm in the United States until the late nineteenth century. Watson found the German psychologist Wilhelm Wundt's views as characteristic of this metaphysical mind-set. Wundt (1832–1920) identified psychology's goal as the study of consciousness. Therefore, research was pursued through "introspection"—thinking about one's own mind and thoughts—and the passive observation of behavior within experiments. Watson found this unacceptable because not only did such research ignore the scientific method in practice, but its conclusions were expressed using imprecise terms (e.g., consciousness) and was biased against evidence unrelated to the consciousness (i.e., pertaining to the physical world).

The twentieth century opened with scholars throughout Europe and the United States attempting to release psychology from these metaphysical roots. The Russian physiologists Ivan M. Sechenov (1829–1905) and Vladimir M. Bekhterev

➤ RADICAL BEHAVIORISM AND OPERANT CONDITIONING

B. F. Skinner, the developer of Radical Behaviorism, was heavily influenced by John B. Watson's theories. However, Skinner expanded the theories of behaviorism, arguing that feelings and thoughts also could be construed as behaviors and could therefore be positively encouraged. Skinner created the idea of Operant Conditioning in which positive and negative stimuli could be used to alter behavior. He conducted many experiments on rats and pigeons to prove that these animals would respond to a positive stimulus, such as food. In one of his most famous experiments, Skinner rigged a machine to give out food at random intervals and then observed that the pigeons would repeat whatever actions they had been doing at the time that food arrived. He believed that such mechanisms could explain the chance origins for superstitious beliefs. Skinner believed that these results could have positive applications for society in child rearing and education, although he added the caveat that animals are not passive receivers of conditioning but instead act and are acted upon by their environment.

(1857–1927) argued that the human mind was solely the result of brain activity, while their German counterparts struggled to develop a more precise terminology for psychology. In the United States, the Functionalism of James Rowland Angell (1869–1949) developed a following as a compromise between the traditional study of consciousness and the physiologist's experimentation on behavior.

John Watson sparked the shift to behaviorism in 1913, when he declared that the science of psychology should focus exclusively on observable behavior. Unfortunately, his ideas were not as compelling as his declaration, leading many contemporaries to accept the title of "Behaviorist" based merely on opposition to metaphysics. Although lacking a unifying system, these "Behaviorists" generally agreed about using scientific experiments to obtain objective evidence, drawing no distinction between human and animal and applying their findings to improving society.

In rejecting the psychology of consciousness, behaviorism required a new foundation of research from which to grow. One group that provided this foundation was the Russian physiologists, including Ivan P. Pavlov (1849–1936) and his scientific explanation of stimulus and response. In his famous dog-and-bell experiments, Pavlov explained that a response may be conditioned by connecting it to a stimulus in the creature's memory (e.g., if a bell is sounded every time a dog is fed for a long enough period, whenever the bell is sounded expectant salivation will occur regardless of the presence of food). He later expanded this idea into elaborate models describing other ways that responses may be conditioned.

Watson agreed with the Russian physiologists that the mind is a function of the body rather than a separate entity. However, he used Pavlov's findings regarding stimulus and response to conclude that all behavior is simply a reflex response to some stimulus, including emotions, talents, thought, and other metaphysical qualities.

Edward C. Tolman (1886–1959) and Clark L. Hull (1884–1952) responded by developing their own systems within behaviorism. Known for experimenting with rats in mazes, each worked from Pavlov's stimulus-response models but separated themselves from Watson by rejecting his assertion that all behavior is reflex and presenting their findings as scientific theories. Attempting to find the connection between behavior and decision to act in his experiments, Hull formulated several complex stimulus-response models. Tolman's investigation of thought processes in his lab rats marked him as a significant behaviorist forerunner of cognitive theory.

Behaviorism was steeped in a uniquely American pragmatism and logical positivism; thus, only in the United States did it become the dominant paradigm in psychology. Other English-speaking countries were marginally influenced by the movement, but most countries had no contact with behaviorism at all. It maintained supremacy in the United States until the 1960s, when Jean Piaget (1896–1980) and the "cognitive revolution" renewed interest in the mind. However, behaviorism did not disappear; rather, it continued to develop indepen-

dently and influence modern psychology into the twenty-first century.

Developmental Psychology

Developmental psychology is the study of psychological changes that occur in human beings over the course of their lives, from infancy through old age. Most of the pioneers of developmental psychology, such as Jean Piaget (1896–1980), were concerned primarily with the psychological development of infants and children, and the field is still considered by some to be centered on the study of children through adolescence. However, most scholars today agree that psychological development continues over a life span and that developmental psychology is not restricted to the study of any particular stage of life. In this regard, the terms “life-span development” and “life-span psychology” are often used to emphasize this fact.

Many developmental psychologists have studied how children learn and how children's minds change as they mature. Jean Piaget is probably the most influential figure in this area and is best known for his theory of the stages of cognitive development. Piaget believed that children, in the course of normal development, pass through four stages, each characterized by a general cognitive structure and understanding of reality. The stages and the approximate ages to which they apply are sensorimotor (birth to age 2), preoperational (ages 2 to 7), concrete operational (ages 7 to 11), and formal operational (after age 11).

Beyond his fundamental qualities of intellectual rigor and scientific imagination, Switzerland's Jean Piaget may have been one of the most idiosyncratic and multidisciplinary scientists of the twentieth century. (AFP/Getty Images)

Piaget's stage theory has influenced scholars such as Lawrence Kohlberg (1927–1987) and Lev Vygotsky (1896–1934). Kohlberg is best known for his stages of moral development theory, while Vygotsky is best remembered for his theory of the zone of proximal development (ZPD). The ZPD refers to tasks a child can do with guidance but not alone and has become a popular concept in education. Vygotsky's work has been further developed by Jerome Bruner (1915–), who developed the model of instructional scaffolding. This theory advocates that supports such as guidelines and templates should be provided when concepts are first introduced to students and may later be removed as students become autonomous learners.

Erik Erikson (1902–1994) was one of the first psychologists to concern himself with human development across the entire life span and was particularly concerned with how individuals establish a sense of identity. His theory of the stages of psychosexual development elaborated on ideas developed by Sigmund Freud (1856–1939). While Freud's theory had five stages—oral, anal, phallic, latent, and genital—Erikson added three stages in adulthood and described the stages in terms of a basic conflict that must be resolved in order for normal development to proceed. For instance, stage six, which takes place in early adulthood, requires resolution of the conflict between intimacy versus isolation. Daniel J. Levinson continued the focus on development in adulthood with his theory that there are four periods, or seasons, of postchildhood life. The seasons and their approximate age ranges are childhood and adolescence, early

➤ JEAN PIAGET

Jean Piaget (1896–1980) received his doctorate in zoology from the University of Neuchâtel in 1918, followed by studies in psychology in Zurich. While working in Paris at a boys' school created by Alfred Binet and directed by Theodore Simon, developers of the modern intelligence test, Piaget noted that children of different ages make predictable errors in reasoning, an observation later developed in his stage theory of human cognitive development. Piaget was a professor of child psychology at the University of Geneva from 1929 until his death.

—Sarah Boslaugh

adulthood (17–45 years), middle adulthood (40–65 years), and older adulthood (age 60 and older). Levinson believed that each season is associated with specific biological and social changes in the individual and that each season presents the individual with specific challenges and tasks to be accomplished. Levinson developed his theory through the study of men only, and researchers' attempts to validate his theory for women have revealed areas of divergence.

Industrial Psychology

Industrial psychology, the professional application of psychology to the problems of industrial life, emerged during the first half of the twentieth century. After World War I, an increasing number of psychologists came to be interested in the subject and gained the active support of both workers and employers, which was crucial to their success of establishing industrial psychology as an academic discipline that was recognized as central to managing the workplace. The message of those early scientists was that psy-

chology, if applied to the various aspects of industry such as organization of the shop floor and techniques of management, branding, marketing, and so forth will increase productivity, eliminate industrial rift, and promote greater social happiness. The promise of increasing productivity by the application of psychology is today widely accepted and practiced, although some of the methods that psychologists use and the questions they seek to address have changed considerably. Today, psychology is recognized as a vital element of workplace organization, although the problems psychologists face, the methods they use, and the solutions they suggest have changed considerably. Moreover, many of the problems in which industrial psychologists were interested during the first half of the twentieth century have developed into separate fields of study, such as organizational psychology, occupational psychology, and market research.

Until World War I, scientific interest in workers was primarily physiological. During the late nineteenth century, doctors attempted to find the best ways to conserve energy at work and to prevent fatigue. As historian Anson Rabinbach demonstrates, these investigations into the science of work were closely linked to liberal agendas of social reform. During the same period, physicians also came to be interested in the health of laborers and their ability to work. Physicians dealt with a range of questions, such as food, safety, and intoxication. A third branch of knowledge was the new science of management that emerged in the decade before World War I. The most well known was Taylorism, which aimed at increasing industrial output by applying scientific methods to the management of individual workers.

During those years, psychology was usually conceived as either a clinical science or, more often, a theoretical study of the mind. But some psychologists called for a psychology that would be applied to the problems of everyday life. Two of the most important promoters of applied psychology were Hugo Münsterberg, a German psychologist whose popular *Psychology and Industrial Efficiency* (1909) outlined the new field of industrial psychological investigations, and Bernard Muscio, an Australian psychologist whose *Lectures on Industrial Psychology* (1910)

was later considered the pioneering text in the British world.

The real impetus for the application of psychology to industrial life was World War I. Impelled by the heavy demand for munitions, belligerent countries began investigating health-related problems in the major industries, and these studies increasingly included attention to the psychological aspects of such work issues as fatigue, rest pauses, monotony, incentives, and so forth. Moreover, the view that psychology could be applied to the problems of daily life was strengthened by the experience of shell shock and combat stress. Working with soldiers who had experienced nervous breakdowns, psychologists such as Charles Myers in Britain and Elton Mayo, who worked with Australian soldiers before moving to the United States, made connections between the experience of war and the demands of peace. In ways that were similar to the reformist agenda of nineteenth-century practitioners of the science of work, they hoped that psychology applied to industry would play a central role in the reconstruction of civil society.

The leading research institute was the National Institute for Industrial Psychology (NIIP), established in London in 1921. A private institute, it was funded by philanthropists and research foundations such as the Carnegie UK Trust and successfully mobilized the support of leading public figures and government agencies. The major part of its income was derived from services rendered to employers, to whom the NIIP promised increased output, reduced costs, and contented workers. To workers, industrial psychologists promised a humane vision of labor in contrast to Taylorism and other forms of scientific management, which were often seen as reducing the worker to a mere automaton. As at similar institutes elsewhere, NIIP researchers studied vocational guidance, personnel selection, motion studies, and various psychological aspects of industrial efficiency. The focus was therefore on the individual worker's capacities and adaptation to the workplace.

A major change in the research agenda came with the studies conducted at the Western Electric Company at its Hawthorne Plant in Illinois between 1923 and 1932. More than 20,000 interviews conducted during those years established

> HUGO MÜNSTERBERG

Hugo Münsterberg was born in Danzig, Germany, in 1863 and joined the Harvard faculty in 1892. His pioneering studies on the psychology of industry and the market culminated in his best-seller *Psychology and Industrial Efficiency* (1912), in which he argued that the key to productive efficiency was matching workers to jobs that they would enjoy. He was also the first intellectual to write about cinema as a new art form, in *The Photoplay: A Psychological Study* (1916). He believed that the new medium's power came from the fact that the way films were edited and directed mimicked mental functions. He was also influential in writing about the use of psychological information in legal situations. He enjoyed being a public figure and came under attack for his defense of Germany during World War I. Münsterberg died in 1916.

(Library of Congress)

attitudes, emotions, and motivation of employees as key to successful management. For the first time, psychologists found ways to articulate the psychological life of workers as groups rather than individuals. The chief promoter of this school was Elton Mayo. While not participating in the Hawthorne experiments and in many ways arguing in very different terms than those who conducted them, Mayo emerged as the single most important promoter of the human relations school in industrial psychology. The language of human relations was used not only to discuss the emotional life of factory workers in terms of a social organization but also to articulate the same questions with references to the workers' life outside the factory and to address issues such as unemployment or labor unrest. As sociologist Nikolas Rose suggests, it proved a powerful political language for the new forms of management of democratic life in the twentieth century.

During World War II there was a massive use of psychologists in all aspects of warfare, at home and abroad. Their work drew heavily on the new science and concepts that had been developed during the preceding decades. For a short while after the war these new sciences, and especially research on human relations, saw an unprecedented expansion, manifested by the establishment of the Tavistock Clinic for Human Relations in London in 1946. From the 1960s onward, the transformations in the nature of governmental culture and workplace organization brought new psychological understandings and new conceptual tools. Perhaps the most important of these, as Nikolas Rose suggests, was the emergence of a new language that conceived the worker as a consumer rather than a producer. The language of human relations that linked factory life to the community has been seen as increasingly out of date.

Pragmatism

Pragmatism is the philosophical theory that attempts to understand meaning or truth in light of what works. In the history of thought, one finds pragmatism resulting from skepticism about the ability to know. For instance, in Plato's dialogues the Sophists are a group who teach their students the art of persuasion because it is "what works" in attaining the benefits of this life, and they are skeptics about the ability to know what is true or good. This skepticism was a result of an increased diversity of philosophies without resolution into a unified view. This diversity was both inside and outside of Greece, as the Greeks came into contact with other civilizations and their worldviews. Similarly, in the modern world—and in a special way within the United States—an increased diversity among philosophical and religious worldviews and an

increased population diversity by the late nineteenth century led to skepticism about the ability to resolve these differences. This skepticism led to pragmatism whereby theories were tested in terms of how well they "worked." There was also a reformist component to pragmatism as it emerged in the late-nineteenth-century United States. Leaders of the movement wished to unseat the intellectual underpinnings of social Darwinism and Herbert Spencer's notion that society and the world, like any natural system, would automatically improve if left unregulated.

Pragmatism is especially connected to William James (1842–1910), who developed it as part of his studies in psychology. Rather than analyze beliefs as mental entities that could correspond—or fail to correspond—to reality, James proposed that beliefs be thought of in terms of how they functioned in a person's life. James thought that as long as beliefs were thought of as mental entities, they could not be studied scientifically. However, if they were instead thought of as affects or consequences in human life, then they are observable and quantifiable.

James made special application of this to religious beliefs: How do religious beliefs work out for individuals and groups in human history? What is the effect on an individual of a religious experience? James gave to these kinds of questions special attention and argued that they could be resolved scientifically through observing whether or not religious beliefs and experiences have beneficial consequences (i.e., Does a given belief help or hinder life?). Some viewed this as an application of Darwinism to psychology, but as was noted earlier it is not dissimilar to pragmatism that has developed in other time periods and is simply an attempt to use practical rationality apart from settling conflicts in the area of pure rationality.

Practical rationality is the study of goals and means to goals. It is in this sense that the phrase "what works" can be understood: Does a given belief result in actions that are conducive to achieving one's desired goals? If so, then that belief works; if not, then it does not work. Under the influence of James, modern psychology (or specifically the American branch) came to focus almost exclusively on behavior. This is not to identify James with the school of thought called

behaviorism but rather to capture his emphasis on how consciousness affects action. There was a shift from the evaluation of truth claims in the abstract to the evaluation of “what works.” In other words, is a given behavior healthy or unhealthy, where unhealthy is defined as causing harm to the self or others and harm is defined as the failure to integrate into one’s environment (which is observable and can be measured in degrees)? If a behavior is unhealthy, then the causes of this behavior are sought with the goal of changing them and therefore changing the behavior. Various schools developed around explanations of these causes, but the overall theory remained unchanged. Beliefs are termed problematic if they cause unhealthy behavior, but they are not analyzed in terms of a true/false dichotomy.

The obvious problem that arises for pragmatism, and for practical rationality when isolated, is that one does not know what goals to seek. “What works” is defined in reference to goals, but there are many different and competing goals that an individual can choose from. It becomes circular to say “choose the goal that works for you,” since what works is defined in relation to a goal. And so, to define healthy behavior in terms of integration into a specified environment is unhelpful because it does not tell us which environment one should choose to be integrated into. Presumably, some environments are harmful, and the individual should not integrate (e.g., Nazi Germany). Furthermore, the skepticism that gives rise to pragmatism undermines the pragmatic endeavor: If we cannot know what is good, then we cannot know what goals to seek, and we cannot know what works. It is because of these kinds of problems that pragmatism has never been a final philosophy, and humans continue to search for truth and meaning as the basis for knowing what goals to choose and for understanding what works.

Existentialism

The philosophical movement of existentialism grew from its founders’ experiences of World War II. The movement’s leaders, which included Jean-Paul Sartre and Albert Camus, had participated in the Resistance against the Nazi occupation of France. They shared in the disillusionment of their compatriots over the Nazi conquest and shared the conviction that they could, through their actions, oppose totalitarianism on ethical

› SARTRE ON EXISTENTIALISM

“Atheistic existentialism, of which I am a representative, declares with greater consistency that if God does not exist there is at least one being whose existence comes before its essence, a being which exists before it can be defined by any conception of it. That being is man, or, as Heidegger has it, the human reality. What do we mean by saying that existence precedes essence? We mean that man first of all exists, encounters himself, surges up in the world—and defines himself afterwards. If man as the existentialist sees him is not definable, it is because to begin with he is nothing. He will not be anything until later, and then he will be what he makes of himself.”

Jean-Paul Sartre, quoted in Morton White, ed., *The Age of Analysis: 20th Century Philosophers* (New York: New American Library, 1983), 124.

Jean-Paul Sartre was one of the most important and visible French intellectuals of the twentieth century. (Library of Congress)

grounds. In its despair, its call to action, and its morality, existentialism captured the mood of many Europeans during and immediately after World War II.

Existentialism broke from traditional philosophy in two ways. The first concerned the relationship between essence and existence. Philosophers distinguish between what a thing is, its essence or conceptual grounds, from a thing's presence as a physical entity, its existence. Existentialists agreed that essence has a primacy over existence with one exception: in the case of humans, existence precedes essence. A person first exists and then only during the course of his life defines himself through his actions. Existentialists held that the authentic person, spurning the impulse toward conformity, gives his or her life meaning through actions, even when these actions go against the norms of a culture.

Existentialists also broke from traditional philosophy in their understanding of rationality and logic. Whereas traditional philosophy and

science ranked these as the faculties that distinguished humanity, existentialism emphasized the degree to which irrational forces shaped human behavior. In Albert Camus's novel *The Stranger* (1942), Meursault, the book's hero, kills a man, not because the killing was part of a rational plan but because, it seems, the sun beating in his face goaded him to murder. Certain that philosophy was more than the exercise of reason, existentialists acknowledged the power of irrationality in human existence.

Rather than a tidy system, existentialism was an attempt to understand the concrete experience of human existence, even if that understanding eluded rational analysis. In its focus on concrete experiences, existentialism rejected abstractions. Sartre, Camus, Malraux, and Heidegger all dismissed God as an abstraction and thus embraced atheism. Yet other existentialists such as the German theologians Martin Buber and Rudolf Bultmann defined their relationship with God as the central experience of their lives. Certain that concrete experience mattered more than abstractions, existentialists affirmed the uniqueness of the individual over the monotony of mass culture.

The call to action was central to the movement. Sartre recounted the story of a young man faced with a moral dilemma. His father and brothers had died fighting the Nazis, and he faced the dilemma of joining the Resistance as his father and brothers had or of staying home to care for his mother. Either choice was morally debatable, and Sartre encouraged him to act and in so doing to create his own morality.

The call to action, central to existentialism, required a heroic engagement with the absurd. Camus' 1942 essay "The Myth of Sisyphus" explores the fate of Sisyphus, whom the gods condemned to an eternity of ceaseless and futile action: he must push a boulder to the top of a mountain in the underworld only to have it roll back down to the bottom. Each time he must retrieve the boulder and begin his labor anew. The meaninglessness of his labor must, one suspects, fill Sisyphus, the existential hero, with despair. Despair at its bleakest may lead to nihilism. But Camus did not sink to nihilism. He declared both Sisyphus and Meursault happy.

The philosophy of existentialism had an enormous impact on literature, the arts, and on popu-

lar culture. At the apex of this movement were Camus and Sartre, each of whom won the Nobel Prize in Literature, Camus in 1957 and Sartre in 1964. The nihilistic vein of postmodern art shared in the mood of despair that marked existentialism. Over the long term, the influence of existentialism is less clear. Its leaders are now dead, and philosophers in the academy have relegated existentialism to a historical movement rather than a living tradition. Moreover, the mood of despair, central to existentialism, lifted amid the prosperity of postwar America and Europe.

Science and Technology

The importance of science and technology for the period from 1900 to 1945 is illustrated by the fact that in a 1999 *TIME* magazine poll about who was the most influential person of the twentieth century, Albert Einstein (1879–1955) came out on top. The great majority of those polled would have had a hard time naming even one of Einstein’s many scientific breakthroughs, let alone explaining the photoelectric effect for which he received the Nobel Prize in Physics in 1921. Einstein was not necessarily admired then or now for the nuances of his theoretical breakthroughs but instead is more generally associated with the progress made in the twentieth century in the fields of science and technology.

Historians should be more precise: Einstein is associated with the betterment of life occurring during the so-called Second Industrial Revolution, which is dated to the end of the nineteenth century and the beginning of the twentieth century. The Second Industrial Revolution not only began to make use of new sources of energy, such as electrical power, petroleum, and finally atomic energy, but also created the mass production of consumer goods that changed the way ordinary people in industrialized nations lived. For the public, Einstein was a symbol for the dramatic social changes that science and technology brought about. While many of these changes were for the good, others, particularly innovations in warfare, were less decidedly so. At the opening of this era, the Swedish chemist and inventor Alfred Nobel’s decision to set up a “Peace Prize” in addition to prizes for scientific innovations telegraphed the growing awareness that technical and theoretical innovations (such as Nobel’s dynamite or later atomic discoveries) could lead to not only social betterment but also vast destruction.

Innovations in manufacturing, industrialization and urbanization, biomedical sciences, practical inventions, warfare technology, communication and transportation, agricultural and animal sciences, and, finally, comprehensive scientific theories, mostly in the field of physics, occurred at a rapid pace from 1900 to 1945 across much of the world. The daily lives of families in the industrialized world changed quickly and dramatically in a generation or two. A grandmother in 1900 had to cure meat with salt to preserve it for the winter. Her granddaughter in 1950 simply went to a department store and bought a refrigerator. A grandmother in 1900

The daily lives of families in the industrialized world changed quickly and dramatically in a generation or two. A grandmother in 1900 had to cure meat with salt to preserve it for the winter.

crocheted her own woolen socks. Her granddaughter in 1950 wore transparent nylon stockings that looked like silk and were many times cheaper. Even today, the older members of families in the industrial world remember these dramatic changes. What became characteristic of the use of technology in the first half of the twentieth century is that through mass production, marketing, and advertising, new technologies and products finally reached ordinary people. For example, the process of refrigeration has been known for centuries. By the end of the nineteenth century, it was widely used on large ships and in big storage facilities. It was only in the early twentieth century that the well-known “fridge” had reached homes, at first the homes of the wealthy and then, through the assembly line’s mass production, the homes of the middle class. It should also be noted that while all this was happening in the First World, or the developed world, the benefits of scientific and technological progress did not reach the developing world before the end of World War II (1945) or later.

At the same time, Einstein and other scientists, like Nobel before them, developed moral qualms about the use of new scientific knowledge. Einstein’s 1939 letter to Franklin Roosevelt urging that the Allies develop an atomic weapon before Germany helped initiate the Manhattan Project. However, when the atomic bombs exploded over Hiroshima and Nagasaki in 1945, Einstein—along with many scientists who more actively participated in the Manhattan Project—publicly regretted his involvement. In the aftermath, an international scientist-based movement organized to discourage governments from developing atomic arsenals but gained little ground during the Cold War. Among these conscience-afflicted scientists, Einstein was a lifelong pacifist, was committed to world peace, and was deeply concerned about how the benefits of scientific progress could reach those less privileged.

As Einstein became an icon of scientific progress of this period, Henry Ford (1863–1947) became an often controversial symbol of the advancements in technology. Ford was not a quixotic figure struggling for world peace but rather a hard-nosed businessman fighting to increase the profits of his corporation. His name was immortalized in the newly coined word “Fordism.” The neologism “Fordism” was not so much a political or economic philosophy but rather a practical guide on how, with the help of technology, particularly through mass production, to make the world a richer and better place. The assembly line, created first in Michigan on the eve of World War I, became the prototype for modern industrial production. Ford’s advice was simple: shorten the time and reduce the money spent on making the product, make a lot of it, sell it for a fair price to a “great multitude,” and pay your workers decent living wages so that they too can buy the cheap product that they are making with their own hands. The strength of Ford’s vision was its practicality; it achieved immediate tangible results. With 15 million automobiles sold over the course of a decade, the Ford Model T truly became “the car for the great multitude,” as its founder envisioned it. The wage of five dollars a day, announced by Ford in 1914, doubled the earnings of the unskilled workers of the time. Ford became

a “wise man” of the era, often interviewed and quoted on a wide range of topics. Fervor for the philosophy of mass production was widespread. Ford’s engineers and other efficiency experts designed systems to optimize the flow of work through the factory floor. The emphasis was on increased production but not necessarily on safety or health. Ford’s critics, among them labor organizers, pointed out mass production’s hidden costs: assembly line work encouraged the “deskilling” of artisans and was repetitive, exhausting, and psychologically numbing. All power of decision shifted from the workers to management.

The development of science and technology and its social consequences in the first half of the twentieth century could be seen as oscillating between these two iconic poles. On the one hand, there was Einstein’s vision of world peace achieved by gradual enlightenment through scientific progress. On the other hand, there was Ford’s pragmatic vision of first making life easier by improving modern conveniences and making life better by increasing wages. Both visions were criticized and even ridiculed. One can only imagine what kind of a reaction Einstein caused among gray-suited politicians by suggesting that all of the U.S. nuclear bombs be placed at the disposal of the newly created United Nations for the purpose of maintaining world peace. Ford and Fordism were satirized many times, including by Charlie Chaplin in the 1936 movie *Modern Times* and earlier by Aldous Huxley in his 1932 novel *Brave New World* (in which Huxley invented a new calendar with years referred to by the phrase “In the Year of Our Ford”).

It is therefore quite significant that the outcome of the struggle of these conflicting visions was the world of the latter half of the twentieth century, a world that resembled Ford’s vision—or perhaps more accurately Huxley’s fear of a hollow consumer paradise—more so than Einstein’s dream of peace.

Outside the Western world, visions of the value of science and technology varied. Mahatma Gandhi (1869–1948), for example, promised to bring freedom and peace to his native nation of India by fostering spiritual enlightenment and tolerance. He had reservations concerning technology, given his disapproval of textile manufacturing machinery and its impact on Indian society. Gandhi’s successors, stepping away from his vision, namely Jawaharlal Nehru (1889–1964), took on the task of industrializing India and thus catching up with the technological changes in the West. In the Soviet Union, new technology was valorized. Vladimir Ilyich Lenin promised earthly paradise to the many nations of the old Russian empire to be achieved through electrification and industry. While most socialists embraced technology and mass production as revolutionary forces and while workers were valorized as heroes, goals set for production pushed workers to extremes, often in settings as dangerous as or more dangerous than in capitalist nations.

In the first half of the twentieth century there were few dissenters from the vision of progress offered by science and technology, whether under communist or democratic institutions. The World’s Fair of 1933–1934 (“A Century of Progress” International Exposition) held in Chicago at the start of the Great Depression, for example, championed a heroic vision of scientific progress stamping out “superstition” throughout the

world. This upbeat message was reflected in what now appears an ominous motto: “Science Finds—Industry Applies—Man Conforms.” Research money flowed to scientists and to corporate research and development teams.

Such faith in progress and its inevitable connection to technology, mass production, and improved living standards was common and could lead to excesses of enthusiasm and misguided thought. One of the most alarming trends was the fad for eugenics that reached a fever pitch in the 1920s and 1930s and interlinked with other social reform campaigns.

Based presumably on Darwinian theory and new knowledge about genetics, social elites sought “race betterment,” first through rigorous immigration controls and second by promoting policies that would prevent “undesirables” within communities or nations from bearing children.

Based presumably on Darwinian theory and new knowledge about genetics, social elites sought “race betterment,” first through rigorous immigration controls and second by promoting policies that would prevent “undesirables” within communities or nations from bearing children. Eugenics advocates in North America and Britain, for example, assumed that there was a natural racial hierarchy, with the Anglo-Saxon race superior to other races, while fertile “lesser” races were threaten-

ing its survival. Forced sterilization campaigns were successfully and legally carried out in the United States in this period, and immigration laws strengthened to radically reduce inflows of what were seen as less desirable races. In Germany, with the rise of the Nazi regime, laws were enacted that made it illegal for Germans to marry so-called undesirables such as Jews. Eugenics underpinned much of Nazi ideology and the ensuing Holocaust. Eugenics linkage to the Nazi regime’s excesses ended social elites’ embrace of eugenics-based notions.

The darker side of the new possibilities that technology offered became prominent in twentieth-century warfare. While inventions in the nonmilitary sectors of industry improved the lives of many people, the same cannot easily be said for military technology. During this period, submarines, poison gas, aircraft and aircraft carriers, radar, rocket-propelled missiles, and the atomic bomb were added to military arsenals. In general, the new technology made war a more deadly exercise, though some was obviously used to lessen the loss of life and limb. This was the darker side of the technological progress that Nobel, Einstein, and many other critics were concerned about. To make things more complicated, the division between military and civilian technology was and remains very porous. Civilian technology can be used for military purposes and vice versa. For example, nylon was used to produce women’s stockings, but it was also used in the making of parachutes. Radar, which was a strictly military invention, soon spilled over to civilian use on ships and airplanes.

Drastic innovations in the biomedical sciences and agricultural and animal sciences also mark this period. The most dramatic changes were in the area of surgery. With the new advancements in the making and use of local and general anesthetics, surgical operations of long duration

became possible. Furthermore, the discovery of penicillin and, subsequently, of other antibiotics improved a patient's chances of surviving a surgery. Surgical techniques advanced so much that complicated and risky brain surgeries became possible. It should also be noted that the two world wars became the largest training ground for the medical profession. In the heat of battle surgeons had to operate for hours, even days at a time, and gained valuable experience. Furthermore, new technologies used during the conflicts also created new kinds of injuries, which, in turn, presented new challenges to the medical profession. Colonialism also affected the advancements in life sciences because various tropical and non-European diseases posed a challenge to the medical profession, leading to the rapid development of cures and remedies.

Breakthroughs in scientific theory were many in this period. During this period the discipline of astronomy probed the beginnings of the universe and the life sciences probed the origins of humankind, while physics probed the nature of matter and energy. In astronomy, powerful telescopes revealed a universe of multiple galaxies. An important breakthrough came in 1929 with U.S. scientist Edwin Hubble's discovery of the redshift in spectroscopy that revealed that all galaxies are receding from each other, indicating that the universe is expanding. In biology, in 1902 and 1903 researchers Theodor Boveri and Walter Sutton published research that indicated that cell chromosomes contained the material that allowed the transmission of inherited characteristics. By 1915 Thomas Hunt Morgan's studies of fruit flies (*Drosophila melanogaster*) confirmed their controversial theory, and by the early 1920s researchers had succeeded in triggering mutations of genes in cell nuclei and firmly established the previously unknown mechanism that Darwin had posited for the generation of variations that might permit natural selection and the evolution of species. The fledgling science of ecology also gained traction in the early twentieth century and gained respectful attention during the agricultural disasters that struck the United States during the 1930s.

The major scientific breakthroughs of the twentieth century, however, belonged to physics. New theorizing not only made atomic energy possible but also dramatically changed the way scientists saw the universe. Einstein's theory of relativity and its revolutionary recasting of classical physics opened the door to new conceptions, some of which even he was loath to accept. During World War I, for example, Karl Schwarzschild, a fellow scientist, sent a letter to Einstein arguing that general relativity opened the door to the singularity of a collapsed star (now known as a black hole) from which no matter or energy could escape. In addition to relativity, the new quantum theory pioneered in the first decade of the twentieth century by scientists such as Max Planck, Einstein, and Neils Bohr turned centuries of scientific tradition upside down. Foremost, quantum theory posited that radiative energy such as light was not continuous or

Foremost, quantum theory posited that radiative energy such as light was not continuous or capable of infinite division but instead was composed of finite lumps, or "quanta."

capable of infinite division but instead was composed of finite lumps, or “quanta.” Louis de Broglie (1892–1987) demonstrated in 1924 with his theory of wave mechanics that electrons are, at the same time, both matter (“corpuscles”) and energy (“waves”). During the same decade, Werner Heisenberg (1901–1976) insisted that an electron’s location and momentum could never simultaneously be pinpointed (i.e., certainty was impossible on the quantum level). Exploring the implications of quantum mechanics, in 1935 Erwin Schrodinger (1887–1961) formulated the so-called Schrodinger’s Cat paradox. The behavior that Heisenberg’s Uncertainty Principle pointed to on the quantum scale (i.e., an electron could be in multiple locations simultaneously) led to bizarre results if projected on a larger scale. Schrodinger offered a thought experiment in which a cat hidden in a box could be posited to simultaneously be both dead and alive (in quantum terms, its two possible superpositions) depending on the unpredictable decay of a radioactive substance that would then trigger a gunshot; from its suspended probabilistic state of alive and dead the cat would actually only become alive or dead when the box was opened and the cat was observed.

Not surprisingly, the gap between scientists and the ordinary public widened as such paradoxical theories about the nature of matter, energy, gravitation, the universe, and reality developed. The years between 1900 and 1945 can truly be called an era of scientific and technological revolution, but they were also rife with paradoxes as well as philosophical and moral concerns.

—*H. Micheal Tarver, Alexander Mirkovic,
and Fred Nadis*

■ Introduction: Manufacturing, Industrialization, and Urbanization

The process of modernization, manifested in the expansion of industry, increased urbanization, and technological innovations including transportation and communications infrastructure, rapidly accelerated from 1900 to 1945. While these developments occurred primarily in the more developed and wealthy regions of the world, they affected all world regions. The emergence of the modern city, with its skyscrapers, electric lights shining on the skyline, transport systems, and factories, was a key historical development in this period. Yet such symbols of possibility could not mask the era’s myriad social and economic problems.

—*Abraham O. Mendoza*

The Assembly Line

Although it had dramatic effects, the essence of the assembly line is very simple. Products are assembled as a conveyor belt passes various workstations, each devoted to a particular assembly function. The various parts needed for assembly are delivered to the appropriate workstation. Labor previously devoted to moving parts around the workplace is thus eliminated. The assembly line dramatically decreased production costs, but jobs on assembly lines were monotonous, and the pace of work was regulated by the conveyor belt.

As with any technological or organizational innovation—and the assembly line was both—the

assembly line had many precursors. In terms of technology, one precursor was the dis-assembly lines developed in the meatpacking industry from the 1860s. Faced with a national market after the advent of refrigerated railcars, meatpackers developed overhead conveyors on which pig and cow carcasses moved past workers, who each were responsible for performing a different operation. The carcasses were at first pushed along these conveyors, but powered conveyors soon followed. The speed of the conveyor regulated the speed at which workers performed their tasks.

Another precursor was the idea of interchangeable parts. In early nineteenth-century industry, parts were assembled by individual artisans, and much filing was often necessary to make parts fit. With the development of specialized machinery for the manufacture of particular components, it became possible to produce guns and other products from components that would easily fit together. While the degree to which perfect interchangeability was achieved with the nineteenth-century American system of manufacturing is sometimes exaggerated, the assembly line was only feasible if workers at each station could perform a particular act of assembly expeditiously.

Last but not least, electrification, which began at the turn of the twentieth century, allowed factories to locate machinery where it best facilitated the production process rather than where it could most easily be attached to an external engine. Electrification also made it easier to operate different machines at different speeds.

In the nineteenth century factory owners had begun to reorganize factories to encourage work flow. The use of iron as a building material allowed for much larger work areas. Also invaluable were the scientific management studies of Frederick Winslow Taylor from the 1890s, in which workers were timed in task performance and best practices identified, and the somewhat later motion studies of Frank and Lillian Gilbreth, in which workers were followed while working by motion picture cameras and their motions analyzed in detail. Assembly lines depended on understanding both the time and motions necessary for each stage of assembly.

The Ford Company's Highland Park plant introduced the first full-fledged assembly line on

THE DISASSEMBLY LINE

(Library of Congress)

The Armour meatpacking plant's disassembly line, Chicago, circa 1909. Such work areas, which included conveyors that moved animal carcasses through the plant for workers at assigned stations, were an important precursor of the assembly line that led to the rise of mass manufacture.

—Rick Szostak

the eve of World War I. Although not designed with the assembly line in mind, the Highland Park factory, built in 1910, was a large, well-lighted space with electrical wiring throughout. Henry Ford was determined to lower the cost of automobile manufacture and was convinced that there was a mass market for automobiles if these could be produced cheaply enough. He and his staff first established a small assembly line for assembling the magnetos that powered the electrical system and found that assembly time fell from 20 minutes to 4 minutes. In 1913 after developing assembly lines for the engine and transmission, they introduced a much longer line for the assembly of the car chassis itself. Even with a rope pulling the chassis past components, assembly time fell from 17 hours to 6 hours. The conveyor belt was then powered and specialized workstations designed, with the

result that assembly time for each car fell to 1.5 hours by the end of 1914.

While the assembly line succeeded in dramatically lowering the cost of production, it did not provide attractive jobs. Ford on average replaced his workforce four times during 1913 alone. In 1914 he introduced the famous five-dollar day, a rate of pay almost double the wages usually earned by unskilled labor at the time. Ford also employed immigrants and blacks who had limited alternative employment opportunities. This trade-off between wages and intrinsic enjoyment of labor was symbolic of the adoption of the assembly line elsewhere in industry. Workers sacrificed a sense of achievement or control in return for higher incomes. Notably, though, further automation would later eliminate some of the more tedious assembly line tasks.

Through the 1920s almost every large factory assembling goods for a mass market would introduce the assembly line or at least some key elements of this such as conveyor belts or a reorganized production process. As machine-tool firms developed specialized machinery for workstations in many industries, the stage was set for the full automation decades later of some steps in production.

Ford's assembly line of 1914 embodied four principles essential to all later assembly lines. First, there was an unprecedented degree of division of labor such that each worker performed only one simple task. Second, interchangeable parts were used throughout. Third, specialized machines were developed for each workstation. Fourth, numerous jobs that had involved moving parts around the workplace were eliminated.

After selling 15 million Model Ts, Ford would find—in the face of competition from General Motors—that consumers wanted some variety in their mass-produced goods. Later assembly lines across many industries would need to have the flexibility to produce goods with slightly different colors and styles. In the post-World War II world the development of programmable numerically controlled machine tools would greatly facilitate this task.

Efficiency Studies—The Hawthorne Plant Experiments

Conducted at Western Electric's Hawthorne Works in Cicero, Illinois, between 1924 and 1933, the Hawthorne Plant experiments formed an important case study that changed the direction of labor-management relations as they influenced generations of management experts with their findings. In the age of assembly line production through the 1920s, scientific management—following from the work of Frederick Taylor—had emphasized the routinization of tasks to increase efficiency. In the wake of the Hawthorne experiments, however, a more complex set of variables was viewed as equally, if not more, important in increasing worker productivity. The most important conclusion of the experiments pointed to the social interaction among workers and between workers and managers as a significant factor in affecting productivity levels. When worker satisfaction was improved through active participation in structuring the work environment, productivity levels also increased, even if work conditions were made worse.

In the decades since the findings were publicized, scholars have criticized the study for its methodological flaws and the subjective interpretation of the data that researchers invoked. The study has even given rise to the term Hawthorne effect to denote a study that leads to increased (yet short-lived) levels of worker productivity based on employees' gratification for being chosen to participate in the project. Despite these critiques, however, the conclusions

of the Hawthorne Plant experiments continue to echo through contemporary labor-management theories, including participatory decision making, quality circles, and total quality management.

First built in 1905 by American Telephone and Telegraph's (AT&T) Western Electric (WE) division, the Hawthorne Works in Cicero, just west of Chicago, Illinois, employed 12,000 workers by World War I. As the primary site of AT&T's manufacture of telephones and telephone switching equipment, the plant expanded its operations to employ over 22,000 workers in the massive factory site by 1927. Known for its welfare capitalism measures, WE instituted a number of programs in the Hawthorne Works to foster satisfaction and company loyalty among the workforce. In addition to offering medical care onsite and educational courses after working hours, WE sponsored numerous sports teams and social programs for its employees. It also instituted numerous efficiency measures in the Hawthorne Works to improve productivity. Like other manufacturers, these efforts typically focused on the scientific management of the workplace to simplify production tasks and make each worker's job more routine and easier to perform.

As part of its efforts to study how work conditions affected job performance, WE agreed to sponsor an experiment to determine the effects of lighting levels on assembly line workers' productivity. Begun in November 1924, the lighting experiments were cosponsored by the National Research Council of the National Academy of Sciences, a federal agency that undertook the project after being lobbied by several manufacturers of industrial lighting equipment, and foundations supported by the Rockefeller Family. Although the researchers hypothesized that reduced lighting would lead to similar reductions in output by workers, there proved to be no correlation between the amount of lighting on the assembly line and worker output. Even as the amount of lighting decreased to dismal levels, productivity actually continued to increase. Although the results from the first experiments were inconclusive, researchers tentatively concluded that factors other than lighting were influencing productivity.

After the National Research Council withdrew from the studies, Clair Turner and George E. Mayo joined the research team in conjunction with the Harvard Business School in April 1928. Intrigued by the outcome of the first study, the research group set up another set of thirteen experiments with a group of five women assembly line workers. Once again changing a number of variables such as lighting, rest periods, and the length of the working day and week, the researchers found no specific correlation between the variables and productivity, which increased a total of 46 percent over the five years of the subsequent studies. From these observations, the researchers concluded that factors such as increased participation by employees in managing the workplace were more important than incentive pay schemes or physical conditions in improving productivity. From this early conclusion, WE followed up the experiments by conducting over 10,300 interviews with its employees to discuss their opinions about their work environment. The experiments themselves continued until they were curtailed as an austerity measure in 1933, as the Great Depression unfolded.

The emphasis on employee participation instead of scientific management of work conditions made an immediate impact on the fields of industrial and labor relations after the researchers' studies began to appear from the late 1920s onward. Elton Mayo, in particular, became the leading expert on industrial human relations and psychology, although it was not long before significant critiques of his work appeared. To many scholars, it was clear that Mayo and his colleagues were far from objective in their interpretation of the data and often ignored workers' statements about their motivations and satisfaction. With an ideological bias that argued against worker self-organization and in favor of managerial prerogatives, Mayo's subjectivity also seemed to predict the conclusions he drew from the evidence. In one instance, Mayo labeled a worker he deemed troublesome as a "Bolshevik," even though there was no evidence that the woman had demonstrated any political leanings. The woman was quickly replaced as a test group member, and the experiments continued.

By suggesting that worker satisfaction—and therefore, productivity—could be improved by a more participatory management style, the Hawthorne experiments nonetheless ushered in a new age of labor-management relations for many employers. Even those who criticized the conclusions agreed that the experiments were a breakthrough in terms of treating the workplace as a complex social environment. Although the results of the Hawthorne experiments did not completely replace the scientific management school in the arena of industrial relations (which held that in-depth mathematical and motion analysis provided the key to worker productivity), they did mark an innovation in the theory and methodology of industrial management studies and their implementation. The contemporary interest in cooperative decision making through practices such as quality circles demonstrates the continuing influence of the Hawthorne experiments.

Skyscrapers

Skyscrapers came to dominate the skylines of major world cities in the first half of the twentieth century. The development of the elevator, the use of steel, and innovations in architectural design made it possible to build structures that rose far above the previous limit of five stories. New York City and Chicago, centers of industry and trade where industrialists were eager to make statements about their worth and power, were home to the earliest and some of the most impressive skyscrapers.

More than any other type of building, the skyscraper is quintessentially twentieth century. The older idea that a city consisted of small- to medium-sized buildings made urban by their proximity to one another fell to the new notion that size mattered. A city showed its significance by how many buildings it possessed, how many people used those buildings, and especially the height of its buildings. The skyscrapers of the nineteenth century were buildings that fit into the existing urban context. Taller than earlier buildings, they were not tall enough to dominate the skyline. At the start of the century, the tallest building in New York City, George B. Post's Pulitzer Building on Park Row, stood 309 feet (94 meters) tall, only slightly higher than the 284-foot (87-meter) steeple of Trinity Church.

However, the new steel buildings that began to appear in Chicago in the mid-1880s turned the old rules of architecture inside out. The Home Insurance Building, built by William Le Baron Jenney in 1885, is generally acknowledged as the first skyscraper. Made of steel and masonry, a fireproof metal frame supported both the inside floors and the outside wall. Elevators in the building allowed for a greater number of stories, fireproofing made them safe, and electric lights accommodated the needs of office workers housed in the structure. Instead of resting a building's weight on thick external walls of brick or stone, Jenney innovated by placing it on an internal framework—a skeleton—of steel columns and beams. Walls would still be necessary for weather protection and adornment, but structurally they had become almost incidental.

The majority of the best-known skyscrapers have been built in the United States. Tall build-

THE FLATIRON BUILDING

New York City's Flatiron Building is not only one of the most photographed skyscrapers in the world but also one of the oldest. Completed in 1902 from a design by Daniel Burnham, the steel and terra-cotta office building at the junction of Fifth Avenue and Broadway has a triangular shape 200 feet wide by 300 feet by 85 feet (61 by 91 by 26 meters) that resembled an iron to contemporary observers. As the building went up, skeptics stood at a safe distance to watch it crumble at the first high wind. The building, designed in the Beaux Arts style, has 22 stories.

—Caryn Neumann

Flatiron Building in New York City during construction, about 1902. (Library of Congress)

ings became a status symbol, showcasing the industries that they housed. These buildings include, in New York City, the Metropolitan Life Insurance Tower (700 feet/213 meters), completed in 1909; the Woolworth Building (792 feet/241 meters), completed in 1913; and the Chrysler Building (1,046 feet/319 meters), completed in 1930. The Empire State Building (1,250 feet/381 meters), part of the race to build the tallest building in the world, was promoted as the Eighth Wonder of the World at its 1931 opening. The devastation of the Great Depression brought construction nearly to a halt worldwide. Rockefeller Center, opened in 1940, was the last great skyscraper of the prewar era and the only large private project executed between the start of the Great Depression and the end of World War II. The centerpiece of Rockefeller Center is the RCA Building (850 feet/259 meters), one of the first office buildings to have air conditioning.

When building resumed after the war, skyscrapers became more streamlined as architects

were influenced by European modernism and the use of standardized parts. The tallest building in the United States is Chicago's Sears Tower. Built in 1974, it stands 1,454 feet (443 meters), taller than the 1,368 feet (417 meters) of the fallen World Trade Center towers in New York City, destroyed in the September 11, 2001, terrorist attacks on the United States. The tallest of the twin Petronas Towers, completed in 1996 in Kuala Lumpur, Malaysia, stands 1,476 feet (450 meters). The Petronas Towers are part of a shift in the construction of skyscrapers from the United States to Asia. By the close of the twentieth century, most skyscrapers were being built in the Far East as symbols of the strength of newly emerging powers.

Electrification

The electrification of cities in the United States and Europe was a piecemeal affair that began with laying telegraph lines in the 1840s. These bestowed commercial advantages on cities (as opposed to the countryside) by focusing news and information on them. Likewise, the telegraph facilitated the expansion of large enterprises, notably railroads and stock markets. At the same time, a series of technologies based on the telegraph, such as burglar alarms, stable calls, and doorbells, familiarized people with the idea that a current carried over wires could be instantaneously transmitted virtually anywhere.

However, practical applications of this notion were few because most electricity still came from batteries, and the use of electricity to provide light, heat, or power was limited until the availability of large, efficient generators in the 1870s. Until then, “impractical” electric lighting was confined to special effects in theaters.

Both in Europe and the United States, regular public electric lighting first appeared in the late 1870s as a spectacular display in city centers and at expositions and fairs. In each setting, electric lighting had to compete with existing gas systems. Department stores and clothiers quickly adopted arc lights because they were cleaner, brighter, and safer than gas, and because they proved popular with customers.

For similar reasons of cleanliness, brightness, and safety, Thomas Edison's enclosed incandescent light (whose distribution system and pricing were designed with competing gas systems in mind) was rapidly adopted where convenience and fashion were most important. First displayed in 1879, his system spread rapidly during the following decade into the wealthiest homes, the best theaters, and the most exclusive clubs in New York, Chicago, and other large cities. In many cases, isolated plants were installed

(in skyscrapers, for example) obviating the need to secure permission to deliver current through public streets via overhead wires (which soon became a public nuisance because of their number) or conduits (which were costly to lay under streets). As a result, a patchwork of competing and incongruent services developed in the 1880s. These were later integrated into unified, mostly privately owned, utility companies, though Progressives did create some public systems, notably in Seattle and Cleveland. Nevertheless, because of the high cost of producing electrical current, as well as the high cost of changing systems, gas supplied the vast majority of private homes with light and heat until 1910. The major shift to electricity did not occur until the years between 1918 and 1929.

In contrast, electric lighting dominated public spaces quickly and by 1900 had already reached an intensity well beyond the purely functional. Large hydropower generators efficiently transmitted alternating current over long distances, making American cities such as New York the most intensively lighted in the world, not least because of the speed of electric advertising. Spurred by the “white way” campaigns of General Electric and the utility companies, even smaller cities aspired to have a “great white way” in imitation of New York, where millions of bulbs flashed in Times Square, creating a new, artificial environment. In Europe, such technological and cultural centers as Frankfurt, Berlin, and Paris also underwent intense electrification in the early decades of the twentieth century.

During these same years, electric traction, often powered by its own generating plants, rapidly displaced horsecar lines and steam transit systems because of its aesthetic and technological advantages. Electric trolleys were faster and cleaner than horsecars; they could stop more precisely and climb steeper grades than cars powered with steam. Electric cars could also be lighted at night and heated in winter. Real estate promoters often invested in or owned traction companies, whose spreading lines defined much suburban and regional development, as in Los Angeles, Boston, and Minneapolis.

In addition, on evenings and weekends electric companies used their superfluous generating capacity to power amusement parks. These diver-

sions typically generated as much as 30 percent of a line's overall traffic, as well as providing a market for electricity. Thus, the trolley established the city as the center of an easily accessible network, from the downtown shopping district to streetcar suburbs to the amusement park and on out to rural hamlets on interurban lines.

Factory and industrial electrification also began with lighting and traction. Flour and cotton mills quickly adopted electric light because of its safety and ease of handling; printers, artists, and others whose work required accuracy and true color values found incandescent light preferable to gas; and factory owners soon discovered that artificial light allowed large interior spaces without regard for windows.

Electric traction proved especially useful in moving materials, particularly in mines and other closed environments. Traction was adapted to overhead hoists and cranes, which began to move their loads more freely overhead when electric motors replaced drive shafts. In short, electricity revolutionized factory design by brightening and opening up work space; it also made new work flows possible, most notably on assembly lines where machines powered by electricity could be arranged in combinations that were impossible with older systems of delivering power.

This is not to say that electrification necessarily caused a particular form of mass production. Rather, it facilitated experiments and new designs. At the same time, electrification changed the location requirements of factories that no longer needed access to rushing water or to coal. Because power lines could reach virtually anywhere, factories could move to the edge of cities or out along main highways. Thus, electrification transformed factory layouts and the location of industry, and it contributed to the gradual disaggregation of walking cities into postindustrial cities that sprawled beyond suburbs into the hinterland. While the automobile has received more attention as an explanation for this development, full deployment of the electrical grid was a precondition for decentralization away from railway lines and the older urban core.

The electrification of homes spread from the wealthy to the middle class only after factory electrification was well under way. The domestic

market became attractive to utilities once the overall load curve peaked during the day, creating a need for compensating nighttime demand from homes and apartments. At first, only lighting was installed, but a series of domestic electric appliances soon appeared, in roughly the order of irons, fans, vacuum cleaners, and washing machines by the 1920s, followed by radios, stoves, phonographs with loud speakers, and refrigerators in the 1930s. Thereafter came a host of other technologies, the most important being air conditioning. It began in public buildings such as movie theaters well before World War II but only became widespread after the war, gradually assuming central importance in climate control, particularly in the warmer parts of the United States. Since electricity also makes possible the creation of artificial daylight, precise delivery of ventilation, and rapid vertical movement on escalators and elevators, it clearly played a central role in creating new urban environments, ranging from the skyscraper, giant department store, amusement park, assembly-line factory, and subway of the early twentieth century to the malls and domed stadiums of later decades.

In short, the modern city is unimaginable without electricity, a technology that underlies many changes in design and function at every level of society. Its importance becomes starkly apparent when power fails, a city is plunged into darkness, and many of its functions are paralyzed, most obviously communications, work, law enforcement, entertainment, and transportation.

■ Introduction: Biomedical Advances

The practice of medicine was transformed by changing conceptions of disease—notably the germ theory of disease, developed in the nineteenth century. The work of Louis Pasteur (1822–1895) and Robert Koch (1843–1910) had indicated that tiny microbes were responsible for many diseases and that controlling the reproduction and transmission of such microbes could be the key to modern medicine. Medical practitioners typically emphasized prevention of disease through improved sanitation, or the cure of disease through new drugs.

Much of the medical profession in the early twentieth century was focused on battling infectious diseases. As if carryovers from the nineteenth century such as cholera and tuberculosis were not damaging enough, an influenza epidemic during World War I spread throughout the world, killing more than 21 million people, the work not of a bacterium but of a much smaller organism, a virus. Although studies indicated that better sanitation might decrease the spread of deadly microorganisms, scientists realized that the human body could never be made perfectly sterile. In addition, physicians emphasized the “microbe” nature of disease rather than the “filth” nature of disease. Although cleanliness certainly would help prevent disease, a person infected with tuberculosis could spread the disease to nearby people in even the cleanest of homes. Despite the medical community’s recognition of the role of microbes in spreading disease, the popular conception of dirt as the source of “germs”—and thus disease and death—continued beyond midcentury and is still prevalent today.

Physicians played important roles in shaping social policy, by defining diseases, formulating appropriate therapy, and making recommendations to public health officials. One example was the effort to eliminate tuberculosis, commonly known as consumption, which combined physicians’ expertise with state-sponsored social programs. When Britain recruited soldiers for the Boer War at the turn of the twentieth century, for instance, officials were shocked at the numbers of young men who were unfit for service.

Armed with the germ theory of disease, physicians proposed a series of measures—rules against spitting in public, strict controls on milk, meat, and other potential breeding grounds for bacteria, and the separation of infected patients in hospital wards. The effort to eliminate tuberculosis continued during the first half of the century as part of a larger campaign to improve the overall health of British subjects. Although it was not very effective in combating the disease, the campaign served as a vehicle for enforcing social laws desired by the middle classes.

In another example of the connections between physicians and social policy, medical practitioners in Nazi Germany helped to initiate the racial hygiene laws by advising on the language to be used. Thus sterilization, euthanasia (medical killing of “undesirables”), and restrictive marriage laws find their origins not merely in extremist Nazi ideology but also in mainstream medicine of the era. As historian Robert Proctor argues, this active participation of medical professionals served to validate racial policies by providing them with a blessing from the scientific community.

Another important development in medicine was the rise of the pharmaceutical industry. Drug companies were an important source of funding for research in the biomedical sciences, and they benefited from the results. The German bacteriologist Paul Ehrlich (1854–1915) first developed Salvarsan, a chemical therapy to treat syphilis; it was marketed widely, but the side effects were so painful that many refused to subject themselves to it. Aside from chemically produced therapies, drug companies reproduced naturally occurring fighters of disease. The 1902 discovery of the body’s regulating fluids (later called hormones) by British scientists William Bayliss (1860–1924) and Ernest Starling (1866–1927) produced a flurry of interest among pharmaceutical manufacturers. Hormone therapy became a crucial area of research, and products that could use hormones to alter the body’s reactions were produced and sold by corporations. The most celebrated of these products was Frederick Banting’s (1891–1941) discovery of insulin in 1921, which

► THE FIRST GENERATION OF JAPANESE MICROBIOLOGISTS

Between 1886 and 1910 three young Japanese physicians worked at major biological research institutes in Germany. All made critical discoveries in the field of microbiology. Shibasaburo Kitasato (1852–1931), encouraged by Western physicians in Japan, worked at Robert Koch's laboratory in Berlin between 1886 and 1891, where he isolated the first pure culture of *Clostridium tetanus*. With Emil Behring, Kitasato did critical early work with tetanus antitoxin. Returning to Tokyo, Kitasato founded a microbiological research institute, initially governmental and later private. In 1894 Kitasato and Alexander Yersin independently identified the bubonic plague bacillus.

Kitasato mentored many young microbiologists. Kiyoshi Shiga (1871–1951) was working in Kita-

sato's institute in 1897 when he discovered *Shigella*, the cause of bacillary dysentery. In 1901 Kitasato sent Shiga to Frankfurt to work with Paul Ehrlich, where Shiga conducted research with antimicrobial dyes and atoxyl, an early arsenical. Shiga returned to Kitasato's institute in 1905.

Sahachiro Hata (1873–1938) was sent by Kitasato to work at the Koch Institute in Berlin in 1908. In 1909 Hata joined Ehrlich in Frankfurt. Hata's expertise with experimental syphilis in animals and his systematic investigation of hundreds of potential antimicrobial arsenicals led to the discovery of Salvarsan. Hata returned to Kitasato's institute in 1911.

—Sandra Moss

was the key to treating diabetes. Other products directly fought bacteria and were called antibiotics. During World War II, U.S. pharmaceutical companies such as Pfizer and Merck mass produced penicillin and saved thousands of soldiers' lives and limbs from infection.

Although industries had the potential to develop "miracle drugs," they also presented dangers when the effects of medicines were poorly understood. Some governments tried to respond to such uncertainties with regulations. The United States, for example, passed the Pure Food and Drug Act in 1906 in order to require accurate labeling of drugs; this measure, officials hoped, would enable consumers to make wiser choices. It also established the Food and Drug Administration to ensure proper controls on potentially dangerous substances. In 1938, after hundreds were killed from a toxic form of the drug sulphanilimide, it passed a law (the Food, Drug, and Cosmetics Act) requiring prescriptions for certain drugs. Before, many narcotics could be purchased without permission from a doctor; now, there were distinctions between over-the-counter drugs and those requiring consent of a physician. This put responsibility for medical ethics and risks directly on the shoulders of government, and it empowered doctors to be the brokers between patients and their

cures, not merely recommending treatment but controlling access to potential remedies.

—Jacob Darwin Hamblin

Radiology

The major task of the medical specialty of radiology is to diagnose diseases of the inner organs with the help of medical imaging technologies. In former times, the only radiologic diagnostic tool was the X-ray machine. More recently, ultrasonography, computed tomography, magnetic resonance imaging, and positron emission tomography have gained in importance.

The history of radiology began in 1895. Wilhelm Conrad Roentgen, a German physics professor, was the first to describe the so-called X-rays, although many other scientists had generated this radiation before, including Johann W. Hittorf, William Crookes, Heinrich Hertz, and Nikola Tesla. As these scientists did not declare their findings publicly or make them widely known, Roentgen came fresh to the analysis of these electromagnetic waves. He independently discovered the X-rays, a form of electromagnetic radiation that is more powerful than visible light or radio waves, while he was working with a primitive cathode ray generator. During an experiment, he noticed a faint

► MEDICAL RADIATION EXPOSURE

X-ray and other radiologic applications have become quite common in our modern health system. Although these technologies enable physicians to make precise diagnoses, we should bear in mind that computed tomography as well as a simple X-ray photo can expose a patient to high-energy radiation. An overdose of this radiation can be hazardous to the human body. Physicians should not expose their patients to unnecessary dangers, nor should patients insist on dispensable screenings. On the other hand, the radiation exposure created by radiology is relatively small in comparison to natural radiation sources from outer space, from the ground, or from inside the human body. If one does not have to undergo computed tomography and X-ray scanning constantly, there is no need to fear these modern technologies. In earlier times, the radiation doses during an X-ray examination were much higher because of less-efficient equipment. Today, medical research is increasingly interested in reducing a patient's risk factors to a minimum.

—Florian Steger and Matthias Schrempf

X-ray photo of Albert von Koelliker's hand made by Wilhelm Conrad Roentgen, about 1896. (Library of Congress)

green light on the wall. The exceptional feature of this light was that it seemed to travel through some books and papers standing between the ray generator and the wall. Being fascinated by this discovery, he began putting various objects in front of the ray generator. Exposing his wife's hand to the radiation for 20 minutes, he produced the first X-ray plate of a human organ. Two months after his pioneering discovery in 1895, he published his paper "*Eine neue Art von Strahlen*" ("*On a New Kind of Radiation*") at the Physical-Medical Society in Wuerzburg, Germany. This was the first formal and public recognition of X-rays.

Roentgen referred to the rays as "X" in order to emphasize that they were unknown. On Janu-

ary 23, 1896, he demonstrated his work in a public experiment to the Physical-Medical Society in Wuerzburg. At the meeting, he produced an X-ray picture of the hand of Albert von Koelliker, a notable anatomist at that time. Von Koelliker spontaneously suggested that these rays be named Roentgen-rays, which is still quite common in many countries. For his pioneering work, Roentgen received the first Nobel Prize in Physics. The committee stressed especially the practical importance of this discovery. The importance of X-rays grew quickly in the area of medical imaging, as bones and teeth could be visualized perfectly and it became easy to detect the exact place and seriousness of fractures.

X-rays penetrate solid objects but are absorbed by some tissues. Exposing a patient to X-rays provides a picture that shows black and white elements. As calcium-containing tissues absorb X-rays very well, they create a positive contrast. Because of that, bones and teeth appear as white structures on the photo. In contrast, soft tissues and air are black on the image and cannot be differentiated. After Roentgen's discovery, physicians could take an X-ray photo in cases where a bone fracture was suspected. If the white image of the bone is not continuous, the suspicion is confirmed. Osteoporosis, a certain bone disease, can also be detected, as the affected tissues show an increased transparency on the image. Tuberculosis, which was quite a common disease in former times and is still widespread in countries of the Third World and in eastern Europe, can also be diagnosed with this X-ray technique.

X-rays, or Roentgen-rays, however, do not capture images of inner organs. It was not until the 1920s that this problem was solved. In 1927 the Portuguese surgeon Egas Moniz produced an injectable contrast medium that was usable in the clinic. This invention was an important step for the diagnostic medicine of the twentieth century. Allowing detailed X-ray imaging of vessels, the alimentary canal, and the urinary tract, contrast mediums are of great importance for numerous modern examination methods and are also applied in sonography and magnetic resonance imaging. Contrast mediums usually contain barium, a heavy metal that is considered to be nontoxic because it is almost insoluble in water. Barium absorbs the radiation much more than the surrounding tissues, and thus the contours of the examined organ appear on the photo. Iodine-containing substances can be injected into the vessels and serve as contrast mediums for the radiography of arteries and veins, a technique known as angiography. As they are excreted with the help of the kidneys, contrast mediums can also be used to visualize the urinary tract. The radiography of the intestine that provides information about inflammations, tumors, or abscesses also requires the use of a contrast medium.

Another important diagnostic method is the use of ultrasound technology. Instead of using

electromagnetic waves such as X-rays, this technology uses high-frequency sound waves far above human hearing in order to generate a picture of the inner organs. The basic idea of visualizing hidden objects with the help of sound developed during World War I. By sending ultrasonic waves generated with the help of quartz crystals into the water, French scientist Paul Langevin developed a method to detect submarines. But as the intensity of the sound waves was extremely strong, this technology was not yet ready for medical use. In 1942 the ultrasound technology was used in medicine for the first time by neurologist Karl Dussik, who relied on ultrasound to create an image of the brain's ventricles. Within the next few years, sonography gained quickly in popularity as an imaging technology completely free of side effects.

Although developed at the turn of the twentieth century, these inventions still act as the cornerstones for today's modern imaging technologies and are used in hospitals worldwide. Computed tomography is the latest derivative of X-ray technology. Using X-ray scanners that rotate around the patient's body, computer tomographs can create three-dimensional images of the inner organs.

Antibiotics

Antibiotics, a class of drug, are produced by microorganisms and are capable of killing bacteria or inhibiting their replication. Some antibiotics kill only Gram-positive or Gram-negative bacteria, whereas broad-spectrum antibiotics kill bacteria in both classes. The terms "Gram-positive" and "Gram-negative" refer to their staining characteristics, a technique discovered in 1884

Alexander Fleming in his laboratory holding a petri dish. Fleming was awarded the Nobel Prize in Medicine in 1945 for his discovery of penicillin more than 15 years earlier. (Library of Congress)

by the Danish physician Hans Christian Gram. Soon after the serendipitous discovery of antibiotics in the 1940s, the drugs began to save lives. So great has been their effect that enthusiasts have credited antibiotics with opening a new era in medicine.

In 1928 the British physician Alexander Fleming, who was growing bacteria in dozens of petrie dishes, chanced upon a single dish contaminated by the mold *Penicillium notatum*. Noting that the bacteria in the dish had died, Fleming surmised that the mold had produced a chemical toxic to them and named the chemical penicillin to signify its derivation from *Penicillium*. Able neither to isolate penicillin in pure form nor to produce it in quantity, Fleming made no headway in treating bacterial infections with it. Penicillin was then a curiosity rather than a cure.

Despite Fleming's lack of success, the British physician Cecil Paine in 1930 first used penicillin on a person, treating gonorrhea in a three-year-old boy. The success of the treatment led Paine to make other trials with penicillin, although in the 1930s few people knew of his work. At Oxford University the pathologist Howard Florey and the biochemist Ernst Chain were aware of Paine's work, and they derived penicillin in pure form between 1938 and 1940. World War II stimulated combatants on both sides to

aim to produce penicillin in bulk. In 1942 the U.S. Department of Agriculture began a crash program, similar to the more renowned Manhattan Project, to mass-produce penicillin at its Northern Research Laboratory in Peoria, Illinois. Robert E. Coghill, director of the lab's fermentation division, began growing *Penicillium notatum*, Fleming's mold, in corn steep liquor and lactose. Although Coghill and his research team increased the production of penicillin more than 20 times over earlier methods, they continued to experiment. One of Coghill's research associates happened upon a rotten cantaloupe in a Peoria grocery and isolated *Penicillium chrysogenum*, and from it they isolated a strain that produced more penicillin than Fleming's mold. The new production techniques and new species of *Penicillium* enabled the United States in 1943 to produce penicillin for both its troops and those of Great Britain, whereas in 1942 the United States had had only enough for 100 patients. With wartime rationing at an end, American pharmaceutical firms began to produce penicillin for civilian use in 1945.

Parallel to the effort at the U.S. Department of Agriculture, Rutgers University microbiologist Selman Waksman searched for other antibiotics. Aware that the tubercle bacillus does not grow in soil, Waksman and graduate student Albert Schatz screened soil microbes for the production of a chemical toxic to the bacterium, discovering in 1943 streptomycin, the first antibiotic effective against tuberculosis. The success of streptomycin was dramatic. In 1940 playwright and Nobel laureate Eugene O'Neill, himself a tuberculosis survivor, had cast the shadow of tuberculosis across the Tyrone family in *Long Day's Journey into Night*. A decade later, thanks to streptomycin, sanitariums were closing for lack of patients.

Waksman's method of checking the soil for antibiotics led to imitators. In 1943 Yale University microbiologist Paul Burkholder along with Oliver Kamm, director of pharmaceutical company Park Davis, began sifting through soil samples worldwide and isolated the antibiotic chloromycetin. Following Burkholder and Kamm, Lederle Laboratories researcher Benjamin Dugger also screened soil from around the world and discovered the antibiotic aureomycin in 1945. After World War II scientists discovered still more anti-

➤ A LIFE WITH MICROBES

Selman A. Waksman (1888–1973) was a microbiologist who won the Nobel Prize in 1952. He was born in Priluka, a town near Kiev in Ukraine, but spent most of his adult life in the United States, where he studied and taught microbiology at Rutgers University. Among his accomplishments was the identification of numerous new antibiotics used in the treatment of infections of not only humans but also plants and animals. The following is from his memoirs:

“In 1939, I started on a new type of hunt, one of the most peculiar and exciting that man has ever undertaken—a hunt for microbes that have the capacity to yield a new kind of life-saving drug. How can expeditions for lions and tigers compare, in the nature of their preparation and results achieved, in the anxiety due to the many failures encountered and in the joy of the final accomplishments, with this new form of hunting? How can a mere desire to kill wild animals, whether they be

birds or rabbits, crocodiles or behemoths, compare with the search for microbes which might yield chemical substances that have the capacity to combat such devastating human diseases and epidemics as tuberculosis and bubonic plague, intestinal infections and typhus fever, typhoid and brucellosis, leprosy and syphilis? The human mind can visualize a hunter trying to kill a dangerous leopard or a lion. But can it visualize the attempt of another type of hunter to domesticate unknown microbes hidden in the soil or in a manure pile, in order to combat the numerous infectious disease-producing germs that lurk to attack man and animals?”

biotics, stirring up hope that the number of antibiotics was nearly infinite and that cures were at hand for all bacterial infections. Indeed, one estimate holds that antibiotics saved 1.5 million lives between 1943 and 1958.

But bacteria are resilient. As early as 1942, scientists discovered that strains of *Staphylococcus aureus*, the bacterium that causes staphylococcal infections, were resistant to penicillin. These strains produced penicillinase, an enzyme that destroyed penicillin and so made *Staphylococcus* immune to penicillin. In 1946, 12 percent of staphylococcal infections at Hammersmith Hospital in London, England, were resistant to penicillin, whereas in 1948 the rate leapt to 59 percent. By 1955, 80 percent of staphylococcal infections were fatal even with penicillin. Streptomycin suffered a similar fate. Some strains of bacteria grew more virulent in the presence of streptomycin than in its absence as though the bacteria fed on streptomycin.

Physicians responded by mixing and matching antibiotics with other drugs, sometimes in trial and error fashion, in hopes of finding a combination lethal to bacteria but safe in peo-

ple. Pharmaceutical companies forged ahead in the search for new antibiotics, but the optimism of the 1940s has faded with the realization that, given enough time, bacteria will evolve resistance to even the newest antibiotic. Like cars, antibiotics become obsolete, giving urgency to the search for the next generation of antimicrobial drugs.

Chemotherapy

One of the most significant advances in medicine during the first half of the twentieth century was the discovery and development of antimicrobial

chemotherapy. The term “antimicrobial chemotherapy” refers to the pharmaceutical treatment of infections caused by pathogenic viruses, bacteria, fungi, and parasites. Antibiotics are narrowly defined as antimicrobial agents derived from other microbes. Physicians today tend to use the term “antibiotic” to refer to any medication that kills or inhibits pathogenic organisms, particularly bacteria. All antimicrobial drugs carry some degree of toxicity for the host. The development of drug resistance in pathogenic organisms has become a major challenge in recent decades. Examples include multi-drug-resistant tuberculosis and antibiotic-resistant hospital-acquired infections.

One of the first effective modern antimicrobial treatments was the bark of the South American cinchona tree, introduced into European practice in the seventeenth century as an anti-malarial medicine. Following that introduction, French chemists Pierre Pelletier and Joseph Caventou extracted pure quinine from the cinchona bark in 1820. Modern antimicrobial chemotherapy began with the discovery of arsphenamine in the Frankfurt laboratory of Paul Ehrlich (1854–1915) in 1910. Ehrlich, an expert in the chemistry of dyes used to stain living tissues and microbes, believed that fixation of dyes or other chemicals to microorganisms was the key to finding magic bullets, chemicals that targeted and killed microbial pathogens with minimal toxicity. Aware that an arsenical compound, atoxyl, demonstrated some antimicrobial activity, Ehrlich and Sahachiro Hata began testing hundreds of arsenicals against corkscrew-shaped spirochetes in vitro and in laboratory animals in 1909. A year later Ehrlich announced that compound 606, arsphenamine, was effective against the syphilis bacterium (*Treponema pallidum*) and other spirochetal infections. Although widespread use of arsphenamine (trade name Salvarsan) caused severe toxicity in some patients, a less toxic arsenical (Neosalvarsan, 1914) remained the primary treatment for syphilis until the 1940s.

With the exception of a few drugs for malaria and other parasitic infections, no major advances were made in antimicrobial chemotherapy for another 20 years. In the late 1920s Gerard Domagk (1895–1964), director of the bacteriology and pathology laboratories at the German dye com-

pany I. G. Farbenindustrie, began testing analine-derived azo dyes as potential antimicrobials. In 1932 Domagk found that chrysoidin-sulfonamide was effective in infected laboratory animals, and three years later the drug was marketed as Prontosil-rubrum. Despite initial skepticism, physicians soon reported seemingly miraculous cures in cases of meningitis, puerperal sepsis, tonsillitis, erysipelas, and pneumonia. In 1936 scientists at the Pasteur Institute in Paris proved that the sulfonamide was the active antimicrobial agent in the drug, and sulfanilamide and its derivatives proved critical in the treatment of wound infections during World War II.

In 1928 the Scottish-born Alexander Fleming (1881–1955), working in the bacteriological laboratory at St. Mary’s Hospital in London, found that a colony of airborne mold had contaminated a petri dish in which he was culturing *staphylococci* bacteria. Rather than discarding the culture, Fleming studied the contaminated *staphylococci* and observed that the bacteria around the mold colony were lysed (gradually eradicated). Filtrates of the mold, identified by American mycologist Charles Thom as *Penicillium notatum*, showed antibacterial activity against a number of pathogenic bacteria. Subsequent efforts by Fleming and his associates to isolate pure penicillin failed, and his 1929 paper on penicillin aroused little interest at St. Mary’s or elsewhere.

At Oxford University, Australian physiologist Howard Florey and biochemist Ernst Chain, a German Jewish refugee, were intrigued by Fleming’s penicillin paper. In 1939 with the aid of biochemist Norman Heatley, a master of innovation in the cash-strapped laboratory, the Oxford group partially purified penicillin from mold fermented in convenient ceramic bedpans. Two years later the Oxford laboratory produced sufficient penicillin to treat a handful of desperately ill patients with remarkable improvements, limited only by the miniscule supply of penicillin. Penicillin was shown to be effective against many bacteria resistant to sulfonamides, and *gonococcus* and the spirochete of syphilis were later found to be sensitive to penicillin, revolutionizing the treatment of venereal disease. The Oxford group turned to the American pharmaceutical industry—the British industry was overwhelmed by war needs in 1941—to perfect and

upscale the fermentation technology required to produce penicillin on a commercial scale. Within just two years penicillin was released for clinical use, with most of the supply going to the military. Semisynthetic penicillins, produced by laboratory manipulation of the basic mold-derived molecule, increased the antimicrobial spectrum and overcame acquired resistance to unaltered penicillin.

Working with others, the Ukrainian Jewish immigrant Selman Waksman (1888–1973), a soil microbiologist at Rutgers University and the New Jersey Agricultural Experiment Station, found that filtrates of some strains of actinomycetes, soil organisms related to both bacteria and fungi, had *in vivo* activity against pathogenic bacteria. Actinomycin, isolated in Waksman's laboratory in 1940, proved too toxic for clinical use, although it would later be used in anticancer chemotherapy. Waksman devised a systematic scheme for isolating the active products from strains of actinomycetes and then testing the products *in vitro* and *in vivo*. Three years later graduate student Albert Schatz isolated the antibiotic streptomycin from *Streptomyces* (previously *Actinomyces*) *griseus*. Effective against a broad spectrum of penicillin-resistant bacteria, streptomycin was shown in 1944 to inhibit *Mycobacterium tuberculosis* *in vivo*, the first glimmer of hope in the quest for an effective treatment for tuberculosis. William H. Feldman and H. Corwin Hinshaw at the Mayo Clinic quickly demonstrated antituberculosis effects in guinea pigs treated with streptomycin, and in 1945 the first human trials of streptomycin were under way. Resistance to streptomycin developed quickly in tuberculosis patients, and the high doses and prolonged treatments resulted in ear damage. Fortunately, within a few years new antituberculosis drugs such as isoniazid and para-aminosalicylic acid, used in long-term combination chemotherapy with streptomycin, effectively cured tuberculosis with acceptable toxicity. Other antibiotics derived from actinomycetes, such as the tetracyclines and chloramphenicol, proved effective against a broad spectrum of bacterial pathogens, and streptomycin has been replaced by newer, less toxic aminoglycosides.

Blood Transfusion and Blood Banking

The life-saving benefits of blood transfusion were realized in the first half of the twentieth century. The prerequisites for success included (1) the technical ability to collect blood from a donor, maintain it in a fluid state, and transfuse it into the vasculature of a recipient; (2) prevention of immune-based transfusion reactions; and (3) the ability to store blood safely until needed. Ironically, many of these life-saving advances were the sequelae of war.

Since antiquity, blood had been recognized as a source of vitality, and the concept of transfusion dates back over 500 years; however, practical applications were limited by both technical obstacles and a lack of understanding of the functions and properties of blood. Many of these early attempts involved transfusing blood from calm animals such as lambs into patients with violent psychiatric disorders with the expectation that the donor's calm temperament would also be transferred. Fortunately, the inability to prevent clotting and other technical problems during the procedures undoubtedly saved many lives, as animal and human blood are highly incompatible. In 1818 James Blundell, a London obstetrician, reported some success treating postpartum hemorrhage with transfusions. In these instances human blood was used to treat blood loss, the primary current indication for transfusion. However, the outcome of transfusions prior to the 1900s was unpredictable and ranged from success to violent reactions resulting in death.

In 1900 Karl Landsteiner, a pathologist at the University of Vienna, discovered the major cause of these unpredictable hemolytic reactions, the

➤ KARL LANDSTEINER (1868–1943)

Karl Landsteiner (1868–1943), an Austrian American pathologist and possibly the most important immunologist of the twentieth century, received the 1930 Nobel Prize in Physiology and Medicine for his discovery of ABO blood groups in 1900. When first notified Landsteiner, who did not consider the ABO system to be among his most important discoveries, naturally assumed that it was for his more recent research. Landsteiner considered his discovery of hapten-antibody reactions (in which simple chemicals linked to proteins can elicit an antibody response) to be his most important work. His other important discoveries included defining cell-mediated (as opposed to antibody-mediated) immunity, isolating the antibody responsible for the first known autoimmune disease (paroxysmal cold hemoglobinuria), and developing monkey models to study syphilis and poliomyelitis (advancing serological testing for both). But it was the direct clinical applicability of the ABO system to blood transfusion that ultimately resulted in the award. Ten years after receiving the Nobel Prize, Landsteiner, with Alexander Wiener, discovered the Rhesus (Rh) blood group antigen system, which

Karl Landsteiner, winner of the Nobel Prize in Physiology or Medicine in 1930. (Library of Congress)

ranks second to the ABO system as a cause of adverse transfusion reactions; this discovery not only further facilitated blood transfusion but quickly resulted in ways to treat and prevent erythroblastosis fetalis, a cause of neonatal mortality occurring when pregnant Rh-negative women develop antibodies to the RBCs of their Rh-positive fetuses.

—James R. Wright Jr.

mismatching of ABO blood groups. Landsteiner examined blood samples from various workers in his laboratory and discovered that the serum of each individual often, but not always, agglutinated and lysed (i.e., dissolved) the red blood cells (RBCs) of other workers. He discovered three blood groups (now known as A, B, and O) and demonstrated the presence or absence of compatibilities between serum and RBCs in blood samples from members of each group. In 1902, a fourth blood group (AB) was discovered by two of Landsteiner's trainees, Alfred von Decastello and Adriono Struli. Although a basic understanding of the ABO system could soon be used to match donors and recipients, occasionally significant transfusion reactions still occurred because of other unknown minor blood groups. In an attempt to prevent these reactions, direct matching agglutination tests using donor RBCs and recipient serum were often performed.

Whole blood, once collected, clots immediately. Because of this, direct transfusion meth-

ods generally were more successful than indirect methods prior to 1915. However, both standard direct methods were technically challenging. One method, developed by the French American surgeon Alexis Carrel in 1905 (recipient of the 1912 Nobel Prize in Physiology and Medicine for pioneering vascular surgery), actually involved suturing the donor's artery (wrist) to the recipient's vein (arm), while the other method, developed by George Crile (founder of the Cleveland Clinic) in 1907, involved connecting the donor artery and vein with a short cannula. Although successful in the hands of very skilled surgeons, the procedure was traumatic, and it was not possible to measure the volume of blood transfused. On the other hand, indirect methods generally involved drawing blood into one or more syringes, which allowed blood volumes to be measured, but such methods were greatly hampered by clotting. However, over a three-month period at the end of 1914, Albert Hustin of Belgium, Luis Agote of Buenos Aires, and Richard Lew-

isohn and Richard Weil of New York City all reported that sodium citrate could be used as an anticoagulant, allowing the uniform adoption of indirect methods. Citrate also functioned as a preservative, preventing RBC degeneration for up to a week if refrigerated. Soon, the addition of dextrose to the solution allowed preservation for up to two to three weeks, making the concept of blood banking feasible. In 1943 Patrick L. Mollison and John Freeman Loutit of England developed an improved preservative, acid-citrate-dextrose, that became the industry standard for several decades.

The first well-documented blood bank was opened by Bernard Fantus in 1937 at the Cook County Hospital in Chicago. The concept was his response to recent work in Russia by the surgeon Sergei Yudin, who in the early 1930s was pioneering the use of preserved cadaver blood for transfusions. Fantus believed that cadaveric donors were the solution for treating critically injured indigent patients who frequently had no friends or relatives to donate blood. However, hospital officials and the medical profession rejected the concept on ethical grounds. Fantus then advanced the idea of saving blood in a bank to which deposits and withdrawals could be made, in a manner analogous to how banks handle money.

Bloodshed associated with war spurred rapid developments in this arena. During World War I, transfusion of citrated whole blood was used occasionally after 1917, but there was no organized military blood transfusion service to rely on. The Spanish Civil War (1936–1939) brought the first opportunity to use citrated blood on a large scale. The Barcelona Blood Transfusion Service collected and distributed 9,000 liters. During World War II, blood transfusion services were perfected and widely recognized as one of the three major medical advances during the war. The other two major lifesaving innovations were the use of penicillin and the placement of surgeons near battlefields.

Most patients do not require whole blood. The concept of using plasma (the liquid remaining after RBCs, other cells, and antibodies are removed) as a blood substitute was implemented for small-scale in-hospital use during the 1930s. However, with the advent of World War II, large volumes of plasma were needed to treat injured

soldiers. Charles Drew, a pioneering African American surgeon with a PhD in blood banking (Columbia, 1940), was appointed director of the Blood for Britain program in 1940. He developed large-scale methods to collect and process plasma in New York City and ship it to Britain. He also helped establish the national blood collection program for the U.S. military, which collected more than 13 million bottles of blood between 1941 and 1945, much of which was processed to dried plasma that could be reconstituted with sterile water at the battlefield. After the war, he helped establish domestic American Red Cross blood banking. Ironically, legend has it that Drew, who was fatally injured in an automobile accident in North Carolina in 1950, bled to death because he was turned away from an all-white hospital; however, it is well established that this is pure fiction.

Enhanced scientific understanding of blood groups throughout the 1900s and technical refinements in blood collection, processing, and storage brought about as a result of World War II transformed blood transfusion and blood banking, bringing both into the mainstream of medicine and thus saving many thousands of lives every year.

Insulin

Biologists today know insulin as the small peptide hormone—secreted into the blood stream by the beta-cells of the Islets of Langerhans of the pancreas—that primarily stimulates cells to

➤ STARVATION THERAPY

Diabetes mellitus has been known since ancient times in Egypt, India, and China. Before the discovery of insulin, it was an acute condition; hyperglycemic shock or acidotic coma killed its sufferers within weeks or months.

By World War I, leading diabetologists such as Elliott P. Joslin (1869–1962) and Henry Rawle Geyelin (1883–1942) were championing Frederick M. Allen's (1879–1964) starvation therapy for diabetes. In the early 1900s, prior to Allen's work, doctors had tried prescribing high-fat and high-protein diets. However, Allen recognized that these substances contributed to dangerously low blood pH, and he recommended instead a balanced but low-calorie diet to avoid both glycosuria and ketoacidosis as long as possible. Unfortunately, this meant such meager food intake that diabetics following a strict regimen of perhaps 750 calories a day soon wasted away to mere skeletons. Not everyone was sure that inanition—the euphemism for death by this treatment—was preferable to a more comfortable life that ended in coma and death sooner rather than after a period of prolonged hunger, and many doctors and patients chose normal-calorie or fad diets (i.e., all oatmeal).

The introduction of insulin ended the need for diabetics to starve themselves. However, insulin did not cure diabetes mellitus; it transformed it into a chronic condition with a different set of symptoms and complications stemming from extended hyperglycemia that regular insulin usage can only slow, not stop.

—Kristen Ann Ehrenberger

take up glucose and use it for energy; the inability of the body to make or respond to insulin leads to diabetes mellitus. Hailed upon its discovery and isolation in the 1920s as a wonder drug, today insulin is incorporated into the daily regimens of diet and exercise of Type I (also known as juvenile or insulin-dependent) and some Type II (also known as adult-onset or noninsulin-dependent) diabetics.

The first scientific evidence of diabetes' biological cause came in 1889, when Joseph von Mering (1849–1908) and Oskar Minkowski (1858–1931) removed a dog's pancreas and recognized that it developed the classic symptoms

of diabetes mellitus: excessive passage of urine (polyuria), excessive thirst (polydipsia), and excessive hunger (polyphagia). In 1893 Gustave Edouard Laguesse (1861–1927) named the insulin-producing tissues in the pancreas the “Islets of Langerhans” after Paul Langerhans (1847–1888), who had described these “little heaps of cells” in 1869. In 1901 Eugene Opie (1873–1971) made the connection between damaged islets and diabetes mellitus.

Diabetologists consequently became interested in treating their patients with some version of organotherapy. Georg Ludwig Zuelzer (1870–1949) made great but ultimately unsupportable claims about the rather toxic pancreatic extract he patented in the United States in 1912. The same year, Ernest Lyman Scott (1877–1966) suggested that the pancreas's “external secretion” of digestive enzymes for the small intestine might be interfering with the isolation of its “internal secretion” of the factor that lowered blood and urine sugar concentrations; however, his adviser persuaded him to abandon the difficult task of tying off the ducts of the pancreas in order to stimulate selective atrophy of the enzyme-producing cells. In 1915 and 1919 Israel S. Kleiner (1885–1966) and Samuel J. Meltzer (1851–1920) also reported the discovery of a nontoxic pancreatic extraction. Perhaps the most successful but unknown researcher was Nicolae C. Paulescu (1869–1931). He published his studies on “pancreine” in French journals and patented its manufacture in Romania in April 1922.

In the fall of 1920, ignorant of Scott's inconclusive results, Frederick Grant Banting (1891–1941) approached John James Richard Macleod (1876–1935) at the University of Toronto about trying some ligation experiments on dogs. Macleod accepted Banting into his laboratory group in May 1921 and offered him an assistant. That summer, Banting and Charles Herbert Best (1899–1978) went through many experimental dogs as they struggled to overcome their inexperience as independent researchers. Neither had read much of the preceding literature, and what Best had encountered of Paulescu's work he had misunderstood.

In August they named their hypoglycemic beef pancreas extract “Isletin,” but as their methods changed they dropped this neologism for

“insulin,” which Macleod apparently suggested without knowing that Jean de Meyer (1878–1934) in 1909 and Edward Sharpey-Schafer (1850–1935) in 1916 had independently coined “insuline.” Despite some sloppiness in their methods and record keeping, Macleod helped Banting and Best announce the work in a handful of cautious journal articles and presentations and—increasingly convinced that they were on to something—devoted more and more of his laboratory’s resources to the problem. Late in 1921 James Bertram Collip (1899–1978) joined the team, further upsetting the delicate balance of egos.

Although Banting fed one of his and Best’s concoctions to Joseph Gilchrist in 1921, the first formal clinical test of an insulin preparation came on January 11, 1922, when Leonard Thompson (1908–1935) suffered a toxic reaction not unlike that of Zuelzer’s subjects. An extract refined by Collip was successfully administered on January 23, and optimistic newspaper coverage of the breakthrough flooded the Toronto researchers’ offices with requests from desperate physicians and patients.

Patent and production talks began with Eli Lilly & Company in the spring of 1922, and by January 1923 “Iletin” was available commercially in Great Britain, then in Latin America, and by the fall in the United States and Canada.

The 1923 Nobel Prize in Physiology or Medicine went to Banting and Macleod, who promptly announced that they would share their halves of the award with Best and Collip, respectively. Insulin research was far from exhausted, however, and the succeeding decades witnessed the development of purer crystalline extracts (1926), long-acting insulins such as protamine zinc insulin (1936), intermediate insulins such as Neutral Protamine Hagedorn (NPH) (1950), the standardization of strength at 100 units per milliliter (U100) (1970s), human insulin (1982), recombinant human insulin (1983), and insulin analogues (1996).

Three more Nobel prizes highlighted other developments in the understanding of insulin. Frederick Sanger (1918–) won the Prize in Chemistry in 1958 for working out its amino acid sequence. Dorothy Crowfoot Hodgkin (1910–1994), the 1964 Nobel Prize winner in Chemistry for the development of X-ray diffraction crystallography,

determined the small protein molecule’s three-dimensional shape. And in 1977, Rosalyn Sussman Yalow (1921–) collected the Nobel Prize in Medicine for developing the radioimmunoassay technique, which made the precise measurement of blood glucose levels much more accurate.

Yellow Fever

Yellow fever is a disease caused by Yellow Fever Virus, which the female mosquito of several species carries and transmits. Yellow fever is indigenous to sub-Saharan Africa and spread to the Americas during the slave trade. By the turn of the twentieth century, yellow fever had spread throughout sub-Saharan Africa, Central and South America, and southern North America, though outbreaks occurred as far north as Philadelphia. Fever marks the onset of the disease and may last for weeks. In many cases the fever subsides, and the fortunate recover. In others the fever returns with jaundice and internal bleeding, causing death. In 1900 American physician and army Officer Walter Reed estimated the mortality from yellow fever at 40 percent.

The realization that more Americans died from yellow fever than from wounds during the Spanish-American War led the United States in 1900 to establish the Yellow Fever Commission with Reed at its head and with the aim of determining both the cause of yellow fever and the means of eradicating it. Reed set to work in Cuba, the island where the United States had fought the Spanish-American War and where yellow fever had been endemic since the seventeenth century.

A technician cultures yellow fever virus in chick embryos, relying on the same method as that of Max Theiler. The virus derived from a chick embryo is then used to vaccinate humans against yellow fever. (Library of Congress)

In seeking the cause of yellow fever, Reed had to choose between two hypotheses. The prevailing one was that yellow fever spread by contact with clothes or bedding soiled with fluids, such as sweat, from the ill. In 1881 Cuban physician Carlos Findlay had countered this opinion by positing that mosquitoes transmit yellow fever. Recruiting volunteers willing to be bitten by the *Aedes aegypti* mosquito, Reed chronicled their condition, noting that everyone bitten by the mosquito contracted yellow fever, some of whom died. Reed had other soldiers sleep on soiled bedclothes, but none of these subjects contracted yellow fever. By October 1900 Reed had, through these experiments, vindicated Findlay's mosquito hypothesis.

After isolating the *Aedes aegypti* mosquito as the culprit, Reed reasoned that the eradication of the mosquito would eradicate the disease. Because the female mosquito laid her eggs in stagnant pools of water, the solution was to drain all standing water. This policy worked not only in Cuba but also in Panama, allowing the United States to complete the Panama Canal in 1913, whereas the French, ignorant of the cause and control of yellow fever, had failed.

Success in lowering the population of *Aedes aegypti* did not, however, entirely eradicate yellow fever. As early as 1907 a yellow fever epidemic in Muzo, Colombia, pointed to another culprit. Physician Roberto Franco observed that the outbreak occurred in the dwellings along

the fringe of the jungle, where *Aedes aegypti* was not numerous, leading him to suspect that another species of mosquito must also transmit yellow fever. In 1928 and 1929 two researchers identified species of *Haemagogus* mosquitoes as transmitters of yellow fever in Africa, and in 1929 scientists came to the same conclusion in South America. Further confirmation came between January and April 1932 when an epidemic swept through Valle do Chanaan, Brazil, an area where *Haemagogus* mosquitoes rather than *Aedes aegypti* were native. Whereas *Aedes aegypti* transmits yellow fever only to humans, *Haemagogus* mosquitoes transmit yellow fever to both humans and monkeys. Even where human population was low, *Haemagogus* mosquitoes perpetuated Yellow Fever Virus by cycling it through monkeys, which were numerous in the jungle. Scientists have adopted the term "jungle fever" for yellow fever that is transmitted by *Haemagogus* mosquitoes.

Although attractive in theory, the eradication of *Aedes aegypti* and *Haemagogus* mosquitoes was impossible in practice, for one could not hope to drain every pool of water in Africa and the Americas. It would be better to guard against yellow fever with a vaccine. In the 1920s, South African physician Max Theiler began his search for a vaccine. Along the way, in 1927, he established that a virus rather than a bacterium causes yellow fever. In the 1920s scientists used monkeys as the host for Yellow Fever Virus in hopes of deriving a vaccine from monkey serum. In contrast to this approach Theiler used mice, which were less expensive and easier to handle than monkeys. In 1932 Theiler derived a vaccine from mice serum. To inoculate a person, one scratched the skin and rubbed the vaccine into the wound as though the vaccine were ointment.

The vaccine was effective and was used in France and in French West Africa. However, it required the production of so large an amount of mouse serum that widespread use of the vaccine was impractical. Aware of this inadequacy, Theiler in 1937 derived a second vaccine, one that was an attenuated live virus. In contrast to the mouse vaccine, inoculation with live Yellow Fever Virus required a subcutaneous injection.

Between 1937 and 1950 physicians inoculated 5.7 million people in Brazil, 1.5 million in

Colombia, 361,000 in Venezuela, 211,000 in Bolivia, and 186,000 in Peru. At the outbreak of World War II, the United States had on hand 18 million doses of the vaccine. Fearing a biological attack from Japan, the United States began inoculating all servicemen and servicewomen. Some of the vaccine was, however, contaminated with hepatitis B. Roughly 330,000 were infected, and 50,000 were hospitalized. Alert to this danger, the United States suspended inoculation of military personnel in April 1942. The British armed forces inoculated at least 500,000 soldiers and sailors during the war.

Employing both mosquito abatement and vaccinations, the campaign against yellow fever succeeded in the United States and in Europe. In 1949, however, an epidemic swept through Panama, Costa Rica, Guatemala, and Mexico. Five epidemics wracked sub-Saharan Africa during the 1950s. Between 1960 and 1962, yellow fever infected some 100,000 Ethiopians and killed 30,000. In 1990, 1,000 people died of yellow fever in Cameroon. In 1992 Kenya recorded the first yellow fever outbreak in more than 25 years. Dour predictions from the World Health Organization underscore that science is far from eradicating yellow fever.

Anesthesia

Anesthesia is the process of making patients insensible to pain, fear, or other discomfort that they would otherwise feel while undergoing medical and surgical procedures. The benefits of surgical anesthesia, by ether inhalation, were first publicly demonstrated in 1846 at the Massachusetts General Hospital in Boston. News of the effectiveness of ether was announced shortly thereafter to the medical community by Henry Jacob Bigelow's article in the *Boston Medical and Surgical Journal* on November 18, 1846. The term "anesthesia" (from Greek roots mean-

ing "without feeling") came into use shortly thereafter. Ether and chloroform inhalation anesthesia continued to be used well into the twentieth century despite disadvantages. Problems associated with their use inhibited what surgeons could do and occasionally had deleterious results.

In the period from 1900 to 1945, a number of significant developments led to increased comfort and safety for patients, improvements to the convenience of operating room personnel, and an expansion of the capabilities of surgery. As a young medical student, Harvey Cushing administered ether anesthesia while assisting at an operation. The patient died, probably as a result of anesthetic overdose. This painful experience convinced Cushing of the need for systematic monitoring of vital organs during anesthesia and surgery. Cushing, with Amory Codman, developed a system for monitoring the pulse and breathing of anesthetized patients in the 1890s, the first anesthetic record. On a trip to Italy in 1901, Cushing was impressed by Scipione Riva-Rocci's sphygmomanometer (an inflatable cuff for the arm used for measuring and recording blood pressure), brought one back to the United States, and introduced blood pressure monitoring into his own anesthetic records. These came to be known as Ether Charts. The use of blood pressure monitoring with anesthesia became prevalent after 1907. Cushing's example of meticulous care influenced surgical practices in ways that significantly lowered mortality rates.

Another landmark ushering in the so-called modern era was the development of endotracheal anesthesia. Flexible tubes passed down the patient's throat allowed safer, more efficient breathing while surgical staff controlled the intake of anesthetic gas. John Auer and Samuel James Meltzer were pioneers of the technique, circa 1909. A key technical modification was the inflatable cuff, which expanded in the trachea and provided an airtight seal. The first gas machines for inhalation anesthesia (starting in 1899 and in common use after 1910) brought calibration and an improvement of standards to anesthetic equipment. Around 1918 the American Dennis E. Jackson saw the importance of mechanical ventilation during surgery and wanted to improve it. Concerned about wasting nitrous

> CURARE

During abdominal surgery under anesthesia in the nineteenth century, surgeons were limited by the fact that a patient's muscles usually became rigid and that abdominal muscles sometimes spasmed. The discovery that curare, a substance used for centuries by South American Indians as an arrow-head poison, could function as an effective and safe muscle relaxant during surgery was a landmark in the history of anesthesia comparable to the introduction of ether in 1846. Curare paralyzes the muscles by acting on their junction with motor nerves and takes effect quickly without interfering with circulation or brain function. French chemists first extracted the plant's active alkaloid, curarine, in 1828. An American explorer, Richard Gill, on a 1938 trip to the Ecuadorian rain forest acquired 24 pounds of crude curare from natives. Returning to the United States, he gave this raw material to the pharmaceutical manufacturer E. R. Squibb. The company prepared and tested extracts, named the resulting drug Intocostin, and distributed it to various researchers. Initial reports warned that Intocostin was too dangerous for use on human beings, but Harold R. Griffith and his associate Enid Johnson in Montreal carefully administered small intravenous doses in combination with cyclopropane during abdominal surgery in 1942. The curare derivative worked safely and effectively, heralding a new era in surgical anesthesia.

—Jeffrey Mifflin

oxide (a nineteenth-century anesthetic agent still used in the twentieth century) and oxygen, he constructed a circle carbon dioxide absorption apparatus for nitrous oxide-oxygen anesthesia. The machine used a pump to circulate the gases, liquid sodium hydroxide to absorb carbon dioxide, and sulfuric acid for elimination of excess moisture. Additional innovations were necessitated by the American Ralph M. Waters's introduction of cyclopropane (1930), a potent anesthetic gas that had the side effect of depressed breathing. The result was closed-circuit anesthesia whereby the patient's respiration was totally controlled by means of a closed rebreathing apparatus that absorbed carbon dioxide. Significant improvements to gas machines by other practitioners followed.

In the first half of the twentieth century a number of new anesthetic agents were introduced, including new halogenated hydrocarbons, distantly related to chloroform but practically nonflammable (making them safer for use in the operating room). New drugs included ethylene (1918), divinyl ether (1930–1933), trichloroethylene (1935), and sodium amytal, a barbiturate widely used for intravenous anesthesia in the United States, from 1929 to 1933. Intravenous anesthesia was injected directly into the bloodstream by means of a hypodermic needle. In 1909 the German Ludwig Burkhardt used chloroform and ether for intravenous anesthesia, which was later followed by Paraldehyde (1913) and magnesium sulfate (1916). John S. Lundy, the “father of intravenous anesthesia,” introduced intravenous sodium pentothal (1934) and coined the term “balanced anesthesia” to describe the practice of not relying on just one agent to accomplish all of the desired effects. In other words, not just providing analgesia, unconsciousness or lack of awareness, and muscle relaxation during anesthesia but rather mixing some of one and some of another to achieve the optimum result. It is one of the key concepts of modern anesthetic practice.

Developments also included improvements to local anesthesia. The first effective local anesthetic was cocaine, used in the late nineteenth century as a numbing agent. Its success led to derivatives that were safer to use, such as procaine (1905), Eucaine (1900), Stovaine (1904), and lidocaine (1943). In 1912 the German Alfred Einhorn discovered Novocain, which was introduced into clinical practice by Heinrich Friedrich Wilhelm Braun, known as the “father of local anesthesia.” After 1916 Novocain was produced in the United States under the name “procaine.” Various anesthetic agents and techniques were administered to women to relieve the pain of childbirth in the first decades of the twentieth century, including “Twilight Sleep” (a combination of scopolamine and morphine first used in Austria in 1902 and popular for several decades until the dangers it posed to the newborn became apparent) and epidural anesthesia (after 1933).

During 1908–1915 the American G. W. Crile achieved advances in muscle relaxation during

surgery by means of anoci-association, which was ether inhalation combined with procaine administered regionally. In 1942 the Canadian Harold R. Griffith introduced curare as a muscle relaxant for anesthetized patients during surgery, facilitating endotracheal intubation and artificial respiration. As such, he paved the way for lighter doses of anesthetic and improved the safety of many procedures.

In the early twentieth century it became apparent that administering anesthesia required specialized training as well as systematic and reliable sharing of information. Anesthesia was recognized in England as a specialty when Oxford University created the first chair in anesthesia at the Radcliffe Infirmary in 1922. Early textbooks on the subject were James T. Gwathmey's *Anesthesia* (1914) and P. J. Flagg's *The Art of Anesthesia* (1916). The U.S.-based National Anesthesia Research Society started the first journal dedicated entirely to anesthesia, *Current Researches in Anesthesia and Analgesia*, in 1922, followed by the *British Journal of Anaesthesia* the next year. In 1928 Ralph M. Waters started the first academically oriented training program for anesthesia at the University of Wisconsin. The Long Island Society of Anesthetists (founded in 1905) became the New York Society of Anesthetists in 1911 and finally the American Society of Anesthetists in 1936. It merged with the American Society of Regional Anesthetists in 1945 to form the American Society of Anesthesiologists (ASA). Although the term "anaesthetist" is used in Great Britain to mean a physician specializing in the study and use of anesthesia, the same term in the United States applies to a nurse or technician trained to administer anesthesia; American physicians who are medically qualified in the field are called "anesthesiologists."

Advances in Neurosurgery

The first half of the twentieth century marked a remarkably successful period in medicine. As new therapies—both pharmacological and surgical—were developed, therapeutic pessimism gradually succumbed to an emerging optimism in medicine's ability to cure or manage illness. The specialization of different branches of medicine allowed physicians to become experts in relatively narrow areas, and this in turn had a positive impact on therapeutics. Neurological surgery constituted one such new and increasingly successful specialty.

Perforations of the human skull for the purpose of tending to a head wound or for allowing "demons" to escape the head of a mentally ill individual date back to antiquity. However, consistently safe and effective brain surgery depends

➤ HARVEY CUSHING (1869–1939)

Harvey Cushing was born in Cleveland, Ohio; studied at Yale and Harvard; and practiced surgery first at Johns Hopkins Hospital in Baltimore and later at the Peter Bent Brigham Hospital in Boston. Quite early in his career, Cushing became particularly interested in operating on the brain and the spinal cord. He brought to the practice of brain surgery his dexterity, his surgical aptitude, and his determination to make neurosurgery as safe as possible. But most importantly, he made practical innovations such as vascular clips for the control of bleeding and techniques for monitoring intracranial pressure. As early as 1910, Cushing reported a rate of operative deaths of only 13 percent, and nine years later this rate had further decreased to 7.4 percent. During his long career, Cushing trained many aspiring surgeons who subsequently established neurosurgery practices all over the world.

on three essential prerequisites: antisepsis, anesthesia, and cerebral localization of function. It was not until the end of the nineteenth century that all these requirements fell into place. In 1846 the American dentist William Morton (1819–1868) discovered ether anesthesia, in the 1860s the British doctor Joseph Lister (1827–1912) discovered and promoted the practice of antiseptic surgery, and throughout the second half of the nineteenth century physiologists such as Paul Broca (1824–1880), Carl Wernicke (1848–1905), David Ferrier (1843–1928), and Hughlings Jackson (1835–1911) effectively correlated distinct cerebral structures with discrete functions, such as vision and speech production.

Despite these advances in medicine, in the last decades of the nineteenth century even the leading surgeons who attempted brain operations—the Scottish William Macewan (1848–1924), the English Victor Horsley (1857–1916), and the German Ernst von Bergmann (1836–1907)—had to contend with problems such as infection, uncontrollable bleeding, unintentional brain damage, and the herniation of the brain through the aperture made in the skull. These surgeons had not been trained in neurology and were working with instruments that did not afford them the finesse necessary for such a delicate organ. It is not surprising, therefore, that only about half of their patients survived.

Truly effective neurosurgery began at the turn of the twentieth century with the work of the American surgeon Harvey Cushing (1869–1939). The casualties during World War I spurred new interest in head trauma and brain surgery while also bringing about successful new therapies, such as blood transfusions, and a more consistent use of recently developed medical technology, such as X-ray machines. Cushing was involved in the wartime effort to establish military hospitals and to increase medical preparedness. During the war, he operated 16 to 18 hours a day, often on soldiers who suffered from head trauma, and he became even more convinced of the necessity of specialized neurological training for surgeons. His hopes were soon after realized. In March 1920 with the founding of the Society of Neurological Surgeons, neurosurgery was officially recognized as a medical specialty in the United States. In its first year the society had only 20 members, but in the following decades this number increased exponentially.

In the second quarter of the twentieth century a new generation of neurosurgeons stood poised to take the field a step further. Cushing had been a cautious and conservative surgeon who limited brain surgery to the removal of tumors and to head trauma. He did not take unnecessary risks; he operated slowly and carefully, avoiding cutting into healthy tissue. Younger neurosurgeons were more ambitious. Cushing's student and sometime-rival Walter Dandy (1886–1946) devised a diagnostic technique (ventriculography) that consisted of the replacement of the cerebrospinal fluid of the brain's ventricles with air. An X-ray of the brain thus allowed the physician to identify any abnormalities in the area surrounding the ventricles. Ventriculography was a somewhat dangerous procedure; Cushing cautioned against it, but the younger neurosurgeons embraced it enthusiastically. This second generation of neurosurgeons extended neurosurgery's purview to include conditions such as epilepsy. The Canadian neurosurgeon Wilder Penfield was the most vocal supporter of the surgical treatment of epilepsy, and he reported that about half of his patients found relief following surgery.

A minority of doctors, such as the Portuguese neurologist António Egas Moniz (1874–1955), the American neurosurgeon James Watts

(1904–1994), and the American neurologist Walter Freeman (1895–1972), embraced radical forms of neurosurgery, such as psychosurgery, that consisted of various procedures designed to damage or remove parts of the brain in order to ease the symptoms of mental illness. In 1936 Moniz was the first doctor to perform a lobotomy, an operation in which the connections between the rest of the brain and the prefrontal cortex are severed. As the serious and irreversible side effects of lobotomies became clear, they were later denounced as excessive and inhumane interventions.

The first half of the twentieth century thus saw the birth of neurosurgery, along with that of other specialties of medicine. Better instruments, a more thorough understanding of brain physiology, and the leadership of Harvey Cushing contributed to the success of neurosurgery to the benefit of patients suffering from tumors, epilepsy, head trauma, and other conditions affecting the nervous system.

Surgical Advances

Modern surgery began with the discovery of anesthesia and antisepsis in the nineteenth century. At the dawn of the twentieth century, the discovery of X-rays and radioactivity enabled surgeons even further. Nonetheless, challenges associated with infection, shock from blood loss, and difficulties with anesthesia rendered surgery inadvisable; as a consequence, physicians often opted for nonintervention. Between 1900

and 1945, however, surgical methods greatly improved due to innovations in specialized equipment and increased diagnostic ability. Injuries sustained during both world wars promoted advances in wound treatment, blood transfusions, and anesthetic methods, affecting a transition from general surgery into the specialized fields of modern surgery.

Harvey Cushing (1869–1929) played a pivotal role in laying the foundation for neurosurgery. His surgical success in removing brain and spinal cord tumors depended largely on his discovery of the Cushing Reflex (relationship among intracranial pressure, rising blood pressure, and a falling pulse) and the use of electrocautery to control hemorrhage. Advances in physics led to the development of cerebral pneumography for localization of brain tumors and lesions, and the important work begun by Hans Berger (1873–1941) with the electroencephalograph revolutionized the treatment of epilepsy.

Plastic surgery emerged as a response to burns and facial injuries sustained during World War I. Harold Gillies (1882–1960) pioneered new methods in reconstructive surgery such as the tubed pedicle graft, which provided continued blood supply and ensured greater survival of transplanted tissue. Gillies used autogenous (reimplanted in the same individual) bone and cartilage grafts to repair cranial injuries and restore the nose. Surgical success depended on the codevelopment of endotracheal anesthesia, as facial injuries prohibited the use of anesthetic masks. Gillies opened a plastic surgery center in Britain, treating thousands of war victims, and thereafter initiated cosmetic surgery on civilians such as face lifts and breast surgery.

Similarly, gunshot fractures led to the first orthopedic centers under the leadership of Robert Jones (1857–1933), whose promotion of the Thomas Splint (effective immobilization) reduced mortality from 80 percent to 20 percent. The extent of injuries to the abdomen from highly explosive weapons of war forced surgeons to abandon their cautious approach and operate on the stomach and intestines. In addition, the muddy battle grounds on the western front were so conducive to bacteria that infections necessitated surgery to allow adequate drainage of pus. Prior to the advent of penicillin,

► TIMELINE OF MEDICAL ADVANCES

- 1895—Roentgen discovers X-rays.
- 1900—Landsteiner identifies blood types.
- 1903—Einthoven develops electrocardiography.
- 1908—Carrel introduces arterial anastomosis.
- 1909—First use of bismuth meal for stomach examination.
- 1912—Herrick's description of a heart attack due to hardening of the arteries.
- 1915—Carrel-Dakin method of wound irrigation with Dakin solution.
- 1916—Introduction of Citrate-Glucose solution to prevent blood coagulation.
- 1918—Dandy invents cerebral pneumography (X-rays after injection of air).
- 1927—Drinker and Shaw develop the Iron Lung (artificial respiration).
- 1929—Berger introduces electroencephalography (EEG).
- 1931—First pneumonectomy by Niessen.
- 1932—Cushing's syndrome discovered (causes upper body obesity and thinning of arms and legs).
- 1932—Wolf-Schindler's gastroscope.
- 1935—Egaz Moniz's controversial lobotomy to relieve obsessive or melancholic states.
- 1941—Penicillin.
- 1941—Pearl Harbor victims injected with albumin for shock.
- 1942—Griffith and Johnson administer curare to paralyze muscles during anesthesia.
- 1944—Blalock-Taussig operation to relieve cyanosis (inadequate oxygenation of the blood) as a result of congenital cardiac or pulmonary defects.
- 1944—Streptomycin.
- 1945—Kidney dialysis machine.

—Andrea Patterson

contaminated tissue had to be excised, and introduction of the Carrel-Dakin wound irrigation method with antiseptic solution reduced infection rates. The inevitable experimental surgeries during World War I also improved the mortality rate of abdominal and gastric surgery for civilians, aided by the invention of the gastroscope that produced more accurate diagnosis for stomach cancer and ulcers.

The discovery of blood types by Karl Landsteiner (1868–1943) in 1900 marked the beginning of blood transfusions, but to avoid clotting, anastomosis (transfusion from donor's artery to recipient's vein) was necessary until the use of sodium citrate as an anticoagulant allowed for direct transfusion and limited refrigeration, leading to the first blood depot during World War I. However, it was not until World War II, when the process of plasma fractionation allowed plasma and albumin storage long term, that blood transfusions were widely used for shock treatment.

Of all emerging specialties, thoracic surgery was last to develop, as admitting air into the pleural cavity causes the lungs to collapse. Surgeons had attempted open chest procedures since the 1890s, but this generally resulted in excessive mortality rates. There were a few notable exceptions, such as the successful suture of the pericardium by Daniel Hale Williams (1856–1931), the first African American cardiologist. Blood transfusions and penicillin improved conditions, and most importantly, advances in clinical anesthesia allowed life to be maintained by artificial respiration during heart and lung surgery. Endotracheal intubations kept the lungs inflated, and Harold Griffith's (1894–1985) introduction of cyclopropane as anesthetic gas, together with curare, effectively solved problems of carbon dioxide removal and muscle reflexes. The Blalock-Taussig operation on "blue babies" showed that congenital heart disease could also be corrected surgically. This along with more reliable diagnostic methods such as X-ray angiography brought cardiothoracic surgery into a recognized medical specialty.

■ Introduction: Age of Invention

In the last decades of the nineteenth century and in the early twentieth century, in the popular rhetoric of magazines and newspapers famous inventors such as Thomas Edison, Nikola Tesla, and Guglielmo Marconi were referred to as “wizards,” amazing and mysterious figures whose fertile brains produced wonders. Electrification and new inventions such as the telephone, phonograph, and radio fascinated the public. Although the image of the lone romantic inventor as a variant on the artist or wizard was popular, the reality by the early twentieth century was that most inventions were the products of industrial research and development divisions, stocked with engineers and bankrolled by large corporations, often with government or military funding. While important patents designated apparent inventors, more often than not great inventions were a collaborative effort: this was true, for example, of radio and television, endeavors that required many theorists and practical tinkerers to perfect. In the first decades of the twentieth century, world’s fairs carefully associated technological advance with corporations, as companies such as General Electric and DuPont highlighted the wondrous results of their research divisions not only in “Halls of Miracles” but also in model kitchens or living rooms and as lone “wizards” like Edison or Tesla began to appear as throwbacks.

A key component of all electronics for decades to follow was the triode vacuum tube that Lee De Forest created in 1906; the vacuum tube remained common in electronic equipment until it was eventually replaced with the transistor, developed in 1947. In addition to the unveiling revolution in electronics, new materials aided the development of industry and consumerism. In the 1920s as part of a joint venture in the United States, the chlorofluorocarbon freon was developed as a nontoxic gas to be used as the refrigerant in compressor-run refrigeration systems. Replacing toxic gases such as ammonia, this breakthrough encouraged the introduction of refrigerators—and later air conditioning—to households. In 1907 Belgian chemist Leo Baekeland created Bakelite, the first industrial-strength plas-

tic. Bakelite was nonconductive, heat-resistant, and easily molded to create the outer shells for radios as well as shielding for high-voltage electrical equipment. In fabrics research, attempts to create what was termed “artificial silk” date to the mid-nineteenth century. The first practical (i.e., nonflammable) variant was developed in the 1890s in Britain and marketed in France as “art silk”; in the 1920s it was renamed rayon. Rayon was derived from wood cellulose; however, an entirely synthetic material, nylon, was invented in 1934 from petrochemicals. Nylon stockings were first offered to the public at the 1939 New York World’s Fair. Polyethylene, another new plastic, was first developed in 1942 and later was used in Tupperware and other now-common products.

The first radar stations were created in Britain during the 1930s, although they became common worldwide during World War II as radar became key to aerospace defense and offense. Research during the war led to many notable developments, including refinements to jet-engine aircraft, rocketry, and the creation of nuclear weaponry, nuclear power, and advanced computing systems.

—Fred Nadis

Nylon

Nylon is a synthetic fiber developed by E. I. du Pont de Nemours and Company (DuPont) during the 1930s. As a material, nylon can have a variety of properties, including those similar to natural silk. The most important early use for nylon was in the manufacturing of women’s hosiery and, during World War II, parachutes. Nylon was the world’s first true synthetic fiber, and it remains one of the most versatile and significant of the artificial fabrics that have replaced natural materials in many applications.

The development of nylon came out of DuPont’s decision in the late 1920s to commit corporate resources to a program of basic chemistry. The director of the firm’s Chemical Department, Charles Stine, felt that such a program would

During World War II, an American worker attends to a massive thousand-spool warping machine, used in the making of nylon thread destined for the fabrication of parachutes. She and millions of other women went without their nylon stockings for the duration of the conflict as production was diverted to military purposes. (Library of Congress)

have a number of advantages. It would provide good public relations for the firm, be useful in attracting top scientists to the firm's employ, and have a practical payoff in terms of new products or processes that would be developed. In the 1930s DuPont promoted the association of science and material well-being with the slogan "Better Things for Better Living . . . through Chemistry."

Among those recruited to DuPont for the nylon project would be Wallace Hume Carothers, the first industrial chemist elected to the prestigious National Academy of Sciences, and Paul Flory, an eventual winner of the Nobel Prize in Chemistry for his work on polymers. While Carothers is often credited with the invention of nylon, the success of the project was, in fact, a team effort. Carothers directed work on polymer chemistry at the new lab building at DuPont's Experimental Station outside of Wilmington, Delaware. More of a theoretical than an applied chemist, Carothers built upon ideas suggested by the work of the Germans Hermann Staudinger and Hermann F. Mark. The work at the Wilmington Experimental Station eventually led to the discovery of two important synthetic products: the rubber substitute neoprene and nylon.

By 1930 one member of the polymer team, Julian W. Hill, had drawn out a filament from a beaker of long-chain polyester. While a number of polyesters were rejected as candidates for a synthetic fiber because their low melting points meant they would not stand up to laundering and ironing, a switch to the ammonia-derived polyamides seemed to have the contrary problem of a melting point too high to be practical for industrial spinning processes. In July 1931 as DuPont became more concerned with ensuring that Carothers's research would yield commercial advantages, the firm filed a patent application that became the basis for DuPont's priority in nylon. A particular form, called nylon 6-6 from its chemical structure, was first prepared by Gerard J. Berchet on February 28, 1935. This would be DuPont's final choice for the basis of nylon fabric. DuPont was not alone in its search for a new synthetic fiber, as an alternative, nylon 6, was developed shortly afterward by Paul Schlack at the I. G. Farben company in Germany.

The origin of the name "nylon" is unclear, but one story claims that it evolved from "no-run." Runs, or unraveling, have always been a major problem in women's hosiery, the product that was nylon's first application. DuPont accepted the generic name, and consumer usage of that name made "nylons" synonymous with "stockings," which were previously made from expensive silk or the less-attractive rayon.

In its development and marketing of nylon, DuPont was able to build upon its experience with earlier substances such as the packaging material Cellophane (1923) and the artificial silk Rayon (1924). The multiyear process of product development involved the firm's Ammonia Department, which made the chemicals used to produce nylon; the Chemical Department, responsible for the polymerization and spinning needed to make nylon fiber; and the Rayon Department, responsible for nylon as a textile. As with rayon and its other synthetics, DuPont would not itself mass manufacture the final products, leaving that to outside manufacturers such as the hosiery makers in this case. DuPont did, however, ensure quality. The wives of DuPont's nylon team researchers performed in-house testing of nylon at DuPont. Continued advances in chemistry and technology ensured that nylon

fabric could be produced with the consistency and with the qualities that consumers desired.

Although the first commercially marketed nylon product was a nylon-bristle toothbrush, by 1938 rumors of nylon stockings and their supposedly indestructible properties were rife. DuPont announced the substance publicly to an audience of members of women's clubs on the site of the forthcoming New York World's Fair on October 27, 1938. In March of the following year, the first 5,000 pairs of nylon stockings were sold to DuPont's own employees. At the World's Fair, which opened the next month with the theme "Building the World of Tomorrow," nylons shown at DuPont's display attracted enthusiastic attention. General sales to the public began on May 15, 1940, and quickly captured a substantial share of their market. The entry of the United States into World War II diverted nylon production into wartime use for parachutes and other war-essential items. The reintroduction of nylon stockings, in short supply, after the war led to unruly nylon riots as consumers scrambled to buy them.

Today DuPont remains the leading nylon producer in the world. While nylon hosiery and lingerie have remained major usages for nylon, they have been joined by tire cords, carpets, and myriad other products.

The Computer

The Internet, email, the World Wide Web, and the modern computer age came to popular consciousness during the mid-1990s. However, the

predecessors of the modern computer date back more than 100 years before this. Some people even claim that simple types of computers were known to the ancient Greeks, such as a recovered analog machine designed to calculate stellar positions and dates from the beginning of the Roman Empire. Devices to aid mathematical calculations are similarly ancient and range from the Chinese abacus to the modern slide rule and manual adding machine. There are also machines, such as the Napoleonic French looms, capable of using patterns in production without having the pattern recited by operators.

Machines capable of operating without human control have been traced back to the U.S. Census Bureau and the 1890 census. The 1890 census was the first instance of machine tabulation rather than human tabulation of the data recorded by field agents. This early machine used wood and metal gears to add totals from cards fed into the machine. There were no electric circuits involved. These cards were the direct precursors for the punch cards used by later electronic computers. The idea for the cards was taken from French looms developed in 1801 that used punched holes to control the color patterns in the carpets being manufactured.

The logic systems of wood and metal gears were eventually replaced by vacuum tubes in the first generation of electronic computers. Each vacuum tube contained exactly one circuit and was originally the size of a lightbulb. Technological advances eventually reduced vacuum tubes to the size of a human thumb. The tube size is the reason people talk about computers as big as large rooms. The earliest practical vacuum tubes were developed during World War I using ideas developed as early as the 1890s. These tubes were eventually replaced by the now familiar integrated circuit (IC) chips in computers, utilizing technology that began to be developed in the 1950s. Modern computers contain several IC chips, each having tens of thousands or even millions of circuits.

Punch cards were the first storage technology used by computers. Eventually they were replaced by magnetic media, starting with tapes and going to the current USB (stick) drives. Each punch card was approximately 8.5 inches by 3.5 inches (21.5 by 9 centimeters). The name comes

The Electronic Numerical Integrator and Computer (ENIAC), developed at the University of Pennsylvania in 1943. (National Archives and Records Administration)

from the need to punch a hole in the card where the data point went. If your program had a “3” in it you used a special hole punch on the printed “3.” An average computer program of a few hundred bytes in length would require hundreds of cards. If the cards got out of order, the program would not run. The important thing about punch cards that remains with computers today is the concept that each point in the data set or the program could contain only one piece of information. This is the same logic that enables all forms of magnetic data storage, which operate by either turning on or off a magnetic field at a specific spot in the storage medium. The phrase “do not fold, spindle or mutilate” comes from computer punch cards.

The concepts behind programming a computer mathematically were first developed by Charles Babbage (1791–1871) for his planned invention, the Difference Engine. Although Babbage never actually programmed a computer, he provided the logical underpinnings necessary for the development of early computer programming. He created machines that demonstrated the possibility of what would become modern computers with the machines that he could build at that time.

The actual mathematical system that is the logical underpinning of all modern computers was developed by George Boole (1815–1864). The mathematical system he devised consists of true and false and ways to combine true and

false mathematically into the logical operations known as “ands,” “ors,” “nands,” and “nors.” The basic building blocks of computer logic—the organizing and manipulating of zeroes and ones—rely on Boolean Logic.

The man commonly given the greatest credit for the development of the modern computer and differentiating it from all of the old machines associated with computers is Alan Turing. Turing lived from 1912 to 1954 in England and devised the Turing machine that defines modern computers. A Turing machine is a device (including but not limited to computers) that meets certain conditions regarding the processing of information. The defining characteristic of a Turing machine is referred to as a Turing test and relates to the sequential form of information stored in and therefore processable by the machine. The test itself and the logic that has arisen from it define how a computer “thinks” in a linear step-by-step fashion and the implications this has for writing computer programs versus how a human thinks in a type of spider web or free association pattern. All computers currently “think” linearly from one end of a program to the other and follow the instructions in exactly the order specified by the programmer. Supercomputers make certain modifications to this situation because they split the program using specific rules so that portions are handled simultaneously. However, each portion is handled in instruction order like a normal computer, and the portions must be re-integrated in precise order. The conditions behind this requirement of computer programming also apply to computer memory. This is different from how a human can handle tasks and remember, because a human can create linkages without needing to follow a specified order.

During World War II, Germany used the first obviously recognizable protocomputers to encode military messages; the Allies used similar machines to break the codes. These machines are not considered computers because they translated the information fed into them depending on the dial positions and did not perform mathematical calculations. These coding machines used sets of tumblers to convert the messages from German into unrecognizable sets of letters. The interesting aspect of these machines is that each preceding tumbler altered the start-

ing value of all the following tumblers so that the starting value became vital to translating the message: the change made to the first letter helped to determine how the second letter changed, which then influenced how the third letter changed. This was accomplished by having each tumbler reset the starting point of the next tumbler when the first tumbler was used.

ENIAC (short for Electronic Numerical Integrator and Computer) was among the first recognizable computers built and was the first publicly known. The Germans (with the Z3) and the English (with the Colossus) also created early computers between 1941 and 1944, but those were kept from public knowledge until recently. ENIAC itself was built in 1943 by engineers at the University of Pennsylvania for the U.S. Army with the purpose of calculating artillery firing tables. This machine was built using vacuum tubes, ran on punch cards, and required rewiring to reprogram. The programs run on the machine were small, measuring in bytes and not in modern kilobytes, megabytes, or even gigabytes, but they used the ideas developed by Babbage, Boole, and Turing. The modern computer age had finally begun.

Intelligence Testing

Intelligence testing through tests of reasoning was developed in the early twentieth century as prior methods of measuring intelligence, specifically craniometry (the measurement of skulls) and the analysis of anatomical stigmata, were increasingly discredited and abandoned by the scientific community. Though intelligence testing represented a major methodological de-

parture from the physically based measures of intelligence in the nineteenth century, most of the intellectuals responsible for developing and popularizing intelligence tests in the United States and Europe perpetuated a theory of intelligence as innate and unalterable by environment or education. For these intellectuals, intelligence testing represented the means to realize a eugenicist social order, one in which individuals of lower intelligence (assumed to be genetically inferior) could be identified and channeled into menial occupations or, at the most extreme, institutionalized and prevented from reproducing. The intelligence testing movement thus rationalized existing racial and class inequality and also served to bolster arguments for restricting immigration to the United States, especially from eastern and southern Europe.

The origins of intelligence testing through the measurement of intelligence quotient (IQ) can be traced to the work of French psychologist Alfred Binet (1857–1911). Binet, who headed the psychology laboratory at the Sorbonne in Paris, was commissioned by the minister of public education in 1904 to develop tests for identifying children who were failing to make adequate progress in the regular classrooms and who could thus benefit from special education. Binet designed an assemblage of short everyday tasks of increasing difficulty with the intent of directly measuring processes of reasoning and capturing a student's intellectual potential with a single score. Binet revised his scale in 1908 by assigning an age level to each task. A child's mental age could then be determined by the last task that the child was capable of completing, which in turn could be subtracted from the child's actual age to determine his or her intellectual level. Binet's scale could thus pinpoint children in need of special education as those whose mental ages lagged far behind their actual age. Binet's scale would provide the model for intelligence testing in the decades to follow, although the specific concept of IQ (defined as the division of mental age by actual age) would not be advanced until 1911, after Binet's death, by German psychologist Wilhelm Stern (1871–1938).

Binet declined to associate his scale with the measurement of intelligence per se. He argued that intelligence was too complex a construct to

measure with a single score; rather, his tests were merely designed for the practical purpose of identifying students with some form of learning disability who could benefit from special instruction. Moreover, Binet rejected the prevailing view of intelligence as constrained by biological inheritance and thus unalterable through education. However, the leading psychologists in the United States and Europe who would be responsible for adapting Binet's scale and popularizing the use of intelligence tests in the school systems and the military explicitly conceived of intelligence testing as a ranking mechanism to sort individuals by innate intellectual ability. Henry H. Goddard (1866–1957), the researcher who first adapted and popularized Binet's scales in the United States, argued that intelligence could be traced to a single gene, which in turn dictated a person's proclivity toward moral or immoral behaviors. He adapted Binet's scale for the purpose of identifying individuals just below the normal range of intelligence, those who would be most likely to engage in criminality and sexual deviance, and advocated for the establishment of institutions to confine these individuals and prevent them from reproducing. In 1913 Goddard tested his adapted scales on immigrants just arriving to Ellis Island, relying on assistants to select intellectually deficient candidates by sight. Disregarding the numerous problems in the administration of the tests, Goddard concluded that the majority of immigrants coming to U.S. shores were below normal intelligence, thus providing ammunition for advocates of tighter immigration quotas.

While Goddard was adapting and administering the Binet scale in the eastern United States, Stanford professor Lewis M. Terman (1877–1956) was also testing his own revision of the Binet scale on samples of school students in northern and central California. Like Goddard, Terman believed that intelligence was inherited and that low intelligence was specifically tied to criminality, poverty, and other social problems. Terman published his scale, the Stanford-Binet, in 1916. In 1917 Terman would join a team of other psychologists, led by Robert M. Yerkes (1876–1956), in an effort to develop intelligence tests for army recruits. This team developed two tests (an Alpha exam for literate recruits and a

Beta exam designed for illiterate recruits or those who failed Alpha) and tested a total of 1.75 million recruits during the course of the U.S. involvement in World War I. Though the testing process itself was fraught with inconsistencies (especially with regard to the testing of recruits with limited to no English literacy), the sheer amount of data lent support and momentum to intelligence testing as the primary solution in restructuring schools to accommodate an ever-growing ethnically and socioeconomically diverse student population.

After World War I, psychologists involved in the army testing effort concentrated on adapting the Stanford-Binet and the army tests, along with scholastic achievement tests, for widespread use in schools throughout the United States. Intelligence testing drew criticism from some segments of the psychological community, especially the contention by Terman that such tests measured an innate inherited intelligence isolated from environmental or educational influence. These critiques were echoed in the media by columnist Walter Lippmann (1889–1974), who also forewarned of the technocratic potential of intelligence tests to dictate the professional opportunities of individuals at a young age. Despite these and other criticisms, including those of school administrators, by 1925 intelligence tests were being used in schools across the United States to classify and divide students into ability groups and to place students with below-normal scores into special classes. Intelligence testing as a means to track students in ability groups was incorporated in Europe, most notably in England with the implementation of the 11+ examination (taken by students at age 11), used to identify a select minority of students for college preparation. The use of intelligence testing in the United States for the purposes of educational tracking would not be challenged until the 1960s, when increasing criticism would prompt several cities and states to discontinue their use in schools.

Mechanical Refrigeration

The development of mechanical refrigeration in the second half of the nineteenth century drastically altered the patterns and practices of food storage at many points between the farm gate and the table. In addition, household refrigeration changed the material culture of millions in industrialized nations at the most basic level of the range of foodstuffs available for consumption.

Mechanical refrigeration systems include such items as the familiar kitchen refrigerator used to store household foods, large commercial cold-storage rooms, industrial units where cooling or freezing is required, and the making of ice for hockey rinks. Although mechanical refrigeration systems are not particularly complex, the technology is fundamentally science based and takes advantage of an understanding of thermodynamics, latent heat, and the phases of matter. The most important type of mechanical refrigerator either in the home or for commercial and industrial uses is based on a vapor compression cycle. The refrigerant, a vapor, is mechanically compressed and condensed into a liquid. It then passes through a valve that abruptly reduces the pressure, thereby allowing part of the refrigerant to expand and evaporate, a process that uses heat. This refrigerant, now cold, moves through a tubular coil and cools the interior of the refrigerator. The refrigerant is returned to the compressor to begin the cycle anew, while the heat is dissipated externally through a heat-exchanging coil. Other types of mechanical refrigeration include gas absorption, once important but now used only where a cheap heat source to evaporate the refrigerant is available; gas cycle, used in some aircraft; thermoelectric cooling, used in portable coolers; and adiabatic demagnetization, used in cryogenics. In everyday applica-

tions, refrigerators cool compartments to a few degrees above freezing to keep items chilled and to about -18°C (0°F) to keep items frozen.

While the principle of artificial refrigeration was demonstrated by the Scottish chemist William Cullen as early as 1748, the first practical refrigeration devices were not built until a century later. Developments by such people as John Gorrie and Jacob Perkins in the United States, James Harrison in Australia, Edmond Carré and Ferdinard Carré in France, and most importantly Carl von Linde in Germany pioneered the construction of refrigeration devices principally for industrial usage.

By the 1880s in many parts of the world, mechanical refrigeration systems were being used for ice making and cold storage as well as in the brewing, dairy, and meatpacking industries. Several factors combine to explain the successful introduction and rapid growth of household refrigeration in the early twentieth century. First, because of the icebox, many households were

➤ EINSTEIN'S REFRIGERATOR

In 1926 Nobel Prize-winning physicist Albert Einstein collaborated with Leó Szilárd on the development of a refrigerator. Supposedly motivated by newspaper reports of a fatal accident involving the ammonia in a Berlin family's refrigerator, the invention was a type known as a gas-absorption refrigerator. Using liquid ammonia, butane, and water, the device had a number of important advantages. First, with no pressure changes involved, the new refrigerator did not require a pump or compressor. As such, not even a power source was needed, only a heat source to drive vaporization. Second, the lack of a pump or compressor enabled the new devices to operate very quietly. In principle, the simplicity and lack of moving parts could allow such a refrigerator to be manufactured and sold inexpensively. The refrigerator was patented in several countries, including the United States, and the rights sold for commercial development, notably to the Swedish Electrolux company. However, the development of Freon gas as a refrigerant and the greater efficiency of gas-compression refrigerators led to a neglect of gas-absorption technology.

One of the first Frigidaire refrigerators, 1921. (Bettmann/Corbis)

already familiar with and becoming reliant upon artificial cooling for the storage of foodstuffs. Second, more and more households, especially in urban areas, had acquired access to electrical power. Third, the refrigerator was part of the broader trend that witnessed a reduction in the hiring of domestic labor in favor of the supposedly labor-saving household technologies of the time. Finally, because of falling prices and increasing profits, refrigerators became within the reach of the broader middle-class market.

In 1904 attendees at the World's Fair in St. Louis, Missouri, saw a self-contained mechanical refrigerator manufactured by the Brunswick Refrigerating Company. Seven years later, General Electric Corporation undertook the significant step of making refrigerators based on a design by the Frenchman Marcel Audiffren. Shortly after World War I, General Motors purchased the small but creative Guardian Refrigerator Company, which was renamed Frigidaire. Soon, General Electric, Frigidaire, and Kelvinator dueled for dominance in what would be the world's biggest market for refrigerators: the United States. Competition and mass production brought prices down, while engineering research introduced a host of new features. These included separate refrigeration and freezer compartments, each with its own temperature control; automatic thermostatic temperature control; redesigned interiors with shelving; and ice cube

trays. For those not on the power grid, companies such as Electrolux marketed gas-absorption refrigerators. The advances in refrigeration became so popular that by 1931 annual production of mechanical refrigerators in the United States alone reached one million units.

Perhaps the most significant engineering problem of the new mechanical refrigerators was the choice of refrigerant. The ammonia and carbon dioxide used in industrial systems were inappropriate to household devices, and a variety of other gases—such as sulfur dioxide, methyl chloride, ethyl chloride, and isobutene—were either toxic or flammable. By 1930, Thomas Midgley and others at the General Motors Research Laboratory had developed the solution: chlorofluorocarbon (CFC). The substance, non-toxic and nonflammable, became manufactured and marketed as Freon by General Motors and a subsidiary of DuPont.

Industrial uses for mechanical refrigeration also continued to expand. The brewing and meatpacking industries became the earliest to make major use of the technology, along with commercial ice making itself. In addition, a variety of goods-storage and foodstuffs manufacturing industries found mechanical refrigeration a boon to their enterprises. The development in 1940 of a roof-mounted refrigeration unit for trucks allowed for the expansion of both short- and long-haul delivery of perishable goods.

The impact of mechanical refrigeration, in particular for food preservation, has been enormous. It has changed the way in which food is marketed and the way households budget for and manage food resources and has permitted a vast increase in the variety of foods available year-round. With foods less likely to spoil, particularly in the summer months, one source of risk in food consumption has been reduced. While a greater choice of available foods does not guarantee the selection of a healthy diet, the increased availability of a greater range of foods has had a measurable impact on nutrition and health. The ability to purchase fresh produce year-round meant the disappearance of the vegetable gardens that were once commonplace even in urban settings. Brand name milk, cheese, meats, and frozen foods, stored first in grocery store cabinets and then household refrigerators,

became and remain essential features of contemporary material culture. The electrically powered refrigerator has also been a part of the making of the modern household, one plugged into a wider industrial world and dependent on access to outside utilities.

Television

Television is a system made of a camera that continuously converts light patterns into a corresponding electrical signal for the displaying of moving images on the screen of a receiver.

A Russian professor of electricity, Constantin Perskyi, coined the word “television” in a paper for the Paris International Electricity Congress in 1900. By then, “seeing by electricity” was the colloquial expression used to describe experiments with transmission of images by electric wires. It was not until the mid-1920s, however, that a satisfying workable television system had been built and publicly demonstrated. Indeed, several individuals set out theoretical schemes and built up experimental apparatuses in order to achieve this goal. They were independent inventors, university scientists, and corporate researchers scattered about North America and Europe. Therefore, the invention of television cannot be credited to a single individual because it mainly resulted from the combination of technologies that inventors borrowed chiefly from both the science of electricity and the telecommunication industry.

Inventors followed two technological paths: the electromechanical and the electrical, the latter of which would become the dominant one.

Early schemes and inventions for a television system were conceived as early as the late nineteenth century. In 1873 an English electrician, Willoughby Smith, published an important observation in the journal *Nature*. He noted that selenium rods, a nonmetallic mineral element used in telegraphic apparatuses, change their electrical resistance when they are exposed to varying light intensities. Knowing that selenium could convert light into an electrical circuit, inventors started to seriously investigate means for transmitting images at a distance. Most of the first theoretical schemes were publicly disclosed in the technical press but were hardly built as experimental apparatuses. Some inventors used magic lanterns for projections, while others used either the telephone or the telegraphic system for signal transmission. A Portuguese professor of physics, Adriano de Pavia, invented the telectroscope, which attracted worldwide attention in 1877. It was more a facsimile apparatus (like the fax machine) than a television system.

Electromechanical technology was the first line of investigation that inventors followed to break an image down point by point for transmission and reception. The Frenchman Maurice Leblanc laid down some fundamental principles in a short note published in *La lumière électrique* in 1880. His scheme was based on the optical properties of light for capturing an image and the use of selenium cells as a pickup device. Several means—rotating prisms, rotating lenses, and vibrating mirrors—were considered to achieve Leblanc’s vision. However, inventors would mostly refer to an invention patented by the German electrical engineer Paul Gottlieb Nipkow in 1885. The image frame was scanned by a camera made of a rotating disk with holes punched in a spiral pattern along the edge. Each hole passed rapidly across the image frame to create a line of definition. When the disk had accomplished a full rotation, the addition of lines produced a television frame. These lines of definition were projected by the receiving device, which was provided with the same rotating disk as the camera.

Another line of investigation for image scanning began at the beginning of the twentieth century. It exploited the properties of the cathode ray tube, an instrument that was used in physical experiments with electricity. Inventors

SEEING BY ELECTRICITY

“The art of transmitting images by means of electric currents is now in about the same state of advancement that the art of transmitting speech by telephone had attained in 1876, and it remains to be seen whether it will develop as rapidly and successfully as the art of telephony. Professor Bell’s announcement that he had filed at the Franklin Institute a sealed description of a method of ‘seeing by telegraph’ brings to mind an invention for a similar purpose, submitted to us some months since by the inventor, Mr. Geo. R. Carey, of the Surveyor’s Office, City Hall, Boston, Mass. By consent of Mr. Carey we present herewith engravings and descriptions of his wonderful instruments.”

were experimenting with the Braun cathode ray tube for the receiver and, later on, the camera. At St. Petersburg Technological Institute, Boris Lvovich Rosing used a Braun cathode ray tube for a receiver and a mirror drum for a camera in his experiments from 1907 onward. A year later a Scottish consulting electrical engineer, Alan Archibald Campbell Swinton, envisioned in the journal *Nature* an all-electric television system. His model used the cathode ray tube designed by the German physicist Karl Ferdinand von Braun for both the camera and the receiver, and his scheme promised to achieve a higher level of definition, as compared to the electromechanical mean for scanning an image. It would not be until 1921 that practical experiments actually started with this technology.

From 1923 to 1926 independent inventors obtained crude black and white images. They staged separate public demonstrations of television systems with the electromechanical technology. In London the Scottish electrical engineer

John Logie Baird demonstrated a workable television system using the Nipkow disc. In Washington, D.C., the inventor Charles Francis Jenkins transmitted images by wireless, relying on two discs for image scanning. Both independent inventors created their own companies to experiment with regular broadcasting. They also commercialized the first television sets. However, in the latter 1920s their efforts were eclipsed by companies such as General Electric in the United States, Marconi in the United Kingdom, Compagnie Générale de Télévision in France, and Telefunken in Germany.

Although the electronic television system was on the rise, it had not yet demonstrated its superiority over its electromechanical counterpart. In 1927 an American independent inventor, Philo Taylor Farnsworth, built a practical all-electric camera tube that he called an Image dissector, which offered a distinct image. He founded the Farnsworth Television Company to commercialize his invention. In 1932 the Soviet-

born American physicist and electronics engineer Vladimir Kosma Zworykin, working for Radio Corporation of America (RCA), achieved a working implementation of the television tube called the iconoscope. Both Farnsworth's and Zworykin's camera tubes consisted of a beam of high-velocity electrons scanning a photoemissive mosaic charged with photons to create a varying electric current that corresponded to the televised image. In 1934 Farnsworth and Zworykin staged separate public demonstrations of working television systems.

Regularly scheduled television broadcasting started in Washington, D.C., in 1928, in London and Berlin in 1929, and in Paris in 1932. The iconoscope was replaced by new generations of television camera tubes called Orthicon, Saticon, and Vidicon. As the electronic television became the industrial standard, experimentations and broadcasts with the electromechanical technology resumed. After 1945 broadcasting companies relied primarily on the monochrome

electrical television camera, while listeners were also equipped with monochrome television sets. The electronic camera tube for color television had been released in 1954. By then, the television system was no longer a chimerical idea: it had become a major component of the consumption society with the mass production of television sets.

■ Introduction: Warfare and Technology

A number of historians of science and technology argue very effectively that there is a causal relationship between warfare and technological evolution throughout time. Peacetime promotes technology at a relatively constant pace of development, but wartime accelerates the pace of technological evolution. It was war, or at least the threat of war, that promoted the rapid development of military hardware in the first half of the twentieth century. Furthermore, although most military equipment, or at least portions thereof, later became useful in civilian society, war remained the underlying factor in the rapid development of many technologies.

From the bow to the crossbow to the development of flight and tanks, militaries and warfare have had an amazing impact on the development of high technology. In the interest of staying ahead of their adversaries, nations have devoted vast sums of money, material, work hours, and research and development toward

building better military technology. In wartime, this trend is accelerated as nations try to overpower enemies and as the enemies, in turn, try to counter new technologies. This dialectic is especially apparent in the twentieth century.

The twentieth century brought into being the concept of total war. Nations that went to war in 1914 were dedicated to the fight bolstered by the idea of nationalism; societies went to war as nations. In turn, the belligerents in World War I (1914-1918) dedicated their entire societies, economies, and ideologies to the prolonged fight. As soon as the war devolved into a stalemate on the western front, World War I gave way to the modern concept of total war. The entire population was mobilized: conscripted soldiers were sent to the front to fight, and civilians at home were brought into industry to produce for the war effort, sent to the mines to extract raw materials, or sent to the farms to produce food for the nation. War became a national effort.

As nations fought, technological development accelerated apace. Nations expended vast effort in order to perfect war-winning weapons of destruction. During World War I, all of the belligerent nations examined and built such weaponry as the technologies of the aircraft and aircraft carriers, submarines, machine guns, poison gas, and tanks all made their way onto the battlefield. Both the Allies and the Central Powers designed, built, and experimented with various high-technology weapons systems in order to bring about the war's conclusion. But developing new technology was not enough; it also had to be understood, adopted, and incorporated into strategic and operational thinking. Thus, the beginning of World War I in 1914 looked a lot more like nineteenth-century warfare than what was to actually develop.

By 1918, armies became truly technological. The Germans were the best at incorporating technology into strategic thinking, and they were so feared that the final peace process limited German technological development severely. But the seeds were planted; technological innovation in the interwar period, both civilian and military, continued at a frantic pace. Former military hardware, such as airplanes, was improved for civilian uses. Specific military hardware, such as tanks, submarines, and machine guns, were materially improved, leading to further doctrinal changes. Various militaries experimented with military hardware that promised high-speed massed firepower and total destruction. Overall, the interwar period was characterized by the rapid development of both military hardware and doctrine.

Interestingly, military technology had an enormous influence on the formation of military doctrine. The Germans, who developed new and innovative tanks and airplanes, led in the doctrine of maneuver warfare. Their concept of blitzkrieg (lightning war)—the name developed later—was based on armor and aviation technological successes in interwar experiments and testing. The French, concerned over German technological developments, concentrated on defensive measures such as the Maginot Line. The British worked on naval and defensive technology, making great strides in the development of single-engine fighter-

interceptor aircraft and inventing radio direction and ranging (radar) equipment and then coordinating it into a comprehensive air defense system. In the Pacific, the Japanese focused on high technology to fight at sea and low technology to fight on land; their motivation was complete control over the Greater East Asia Co-Prosperity Sphere. The Italians, who did not have the industrial base, continued to dream of Italian high-technology weapons systems of all types, while in fact they relied on their Axis German partners for almost everything. The Soviets, emerging from the growing pains of Marxism-Leninism combined with Stalin's iron will, suffered from a lack of industry and technological development.

The isolationist Americans were perhaps the most interesting case in the interwar period. The United States had an intense desire to keep out of European—and by extension world—affairs but at the same time became involved nearly everywhere. Up until the Great Depression (beginning in 1929), the United States was one of the world leaders in specific technology, especially the civilian uses for aircraft. By the 1930s economic depression led to a sense of incredible industrial potential but little actual technological or doctrinal evolution. The Americans did not have a strong record in the interwar period, but this can be explained through economics rather than technology.

Military technology was the focus of World War II. German technology ruled the battlefield in the campaigns against Poland, Norway, the Low Countries, and France; the war became an effort to stem the tide of German high-technology weapons systems and the military doctrine that drove them forward. The Battle of Britain (1940) showed the limits of airpower technology and doctrine as well as the power of the defensive and insular capabilities of the English Channel. But in the German invasion of the Soviet Union (1941), the Soviets were left exposed to the speed and maneuverability of the German onslaught. In the Pacific in the closing month of 1941, the United States, the British, and everyone else who faced the Japanese had a frontline account of the new Japanese Imperial Navy's seapower technology and doctrine. The Japanese ran rampant across the Pacific for months

with new hardware and unmatched operational doctrine.

However, by the summer of 1942 in the Pacific at the Battle of Midway, American military technology began to drive the Japanese back. Moreover, by the winter of 1942–1943 on the eastern front the Soviets began to turn the tide against the Germans. The Soviets on land and the British and Americans in the Combined Bomber Offensive over Germany exhibited the two extremes in military technology. The Soviets were a massed low-technology military, relying on the dedication and sacrifice of the Red Army soldiers to counter the weight of the Germans on land. The Western Allies—the British and Americans—relied on high technology in the form of heavy bombers, fighters, and deception to counter the Germans. After the D-Day invasion of the continent, the British and Americans both preferred to expend material rather than manpower. And by the end of the war in Europe, the Allies actively sought out German scientists, engineers, and designers in an effort to improve each of their own postwar military technology capabilities. The Germans were the recognized leaders in a number of technological fields; the Allies competed directly to obtain German manpower and equipment.

In the Pacific war, technology also emerged as the deciding factor. For the Americans, it was a combination of skill and determination as well as effective use of technology and doctrinal development that eventually defeated the Japanese. Not only did U.S. submarines destroy nearly all of the Japanese merchant fleet, but the U.S. Navy eliminated the Imperial Japanese Navy as an effective fighting force. The U.S. Army and U.S. Marine Corps took important island airfields, and the United States, with its two latest technological advances, forced the Japanese surrender. The first was the Boeing B-29 Superfortress, a heavy four-engine bomber and the apex of World War II bomber development; the second was the atomic bomb. The war ended after the United States dropped two atomic bombs on Japan, the defining moments in technological warfare.

The Cold War began with improved military technology including tanks, machine guns, submarines, airplanes, aircraft carriers, and radar. In addition, both superpowers dedicated vast re-

sources to research and development programs in order to maintain and improve technological capabilities. Added to the mix were the new weapons systems developed during World War II. As the superpowers began Cold War posturing, they both fielded jet aircraft, missile technology, and improvements all around. Until 1949 the United States had a monopoly on atomic power and was very surprised when the Soviets tested their first atomic device. The Cold War was characterized by races for high-technology systems, including the Space Race, the Bomber Gap, and later the Missile Gap. Technology in turn influenced military doctrine and national policy with the policy of containment, atomic diplomacy, and the concept of mutually assured destruction.

Military technology is a constantly evolving field. In peacetime, military technology, like other technologies, evolves at a steady pace with few historical revolutions. However, during wartime, military technology advances rapidly. But with all technologies, the benefit is in its intelligent use within a system. With military technology there are many improvements; however, the most successful military technologies are the ones incorporated for use on the battlefield. The following sections outline some of the most influential military technologies of the twentieth century.

Machine Gun

The machine gun on the battlefield was a natural evolution of the effort to increase small-arms firepower. By 1914 the machine gun transformed the Western style of warfare once and for all. Armies adopted machine guns in order to increase the efficiency and effectiveness of the individual combat soldier on the field of battle. Machine guns eventually replaced bolt-action rifles as the premier infantry weapon of choice.

The concept of the machine gun grew out of the desire for mobile firepower. Beginning in the U.S. Civil War (1861–1865) and with continued evolution through the Franco-Prussian War (1870–1871), the machine gun eventually gained a place on the battlefield. The Gatling gun and later the Belgian Mitralleuse (used by the French) began their operational lives as artillery pieces. Initially able to increase firepower on the

battlefield from a cyclic rate of 4 to 6 shots (rounds) per minute (the maximum for a musketeer) to more than 120 rounds per minute (as long as the gun could be fed), the machine gun became a powerful set-piece weapon.

In 1881 an American, Hiram Maxim, invented the first real automatic machine gun. The Maxim gun used the recoil of the shot to unlock the bolt, reload, and fire the weapon automatically. Although it was nearly light enough to be carried by one man, it was primarily used on a carriage for stability. The Maxim gun would fire as long as there was available ammunition and at the unprecedented rate of 500 rounds per minute.

Experiments continued in different settings and against different foes. Even though the British had used license-built Gatlings against the Zulus in southern Africa, the machine gun came of age in World War I. The Hochkiss, Vickers, and Spandau guns of 1914–1918 provided mobile

► MACHINE GUN WARFARE

By World War I the machine gun changed the nature of warfare. Infantry were increasingly capable of inflicting damage on the enemy, and machine guns became more effective and widespread during the war. As cyclic rates increased and crews learned to use their weapons, the machine gun helped facilitate static, defensive warfare, the trench warfare that characterized World War I. However, with technological evolution, the machine gun also became more portable and effective as an individual infantry weapon. Mobility was restored as infantry adopted efficient destructive capabilities. Through World War II and beyond the machine gun (assault rifle) has developed as the ubiquitous infantry weapon of choice, increasing the lethality and efficiency of each individual soldier.

and relatively light battlefield firepower. Arguably one of the reasons for the stalemate of the western front was the machine gun's abilities to repel continued human-wave attacks such as those seen at Verdun and the Somme. During World War I the cyclic rate increased from 600 to 1,200 rounds per minute. When combined with other wartime technology, such as motorcars, aircraft, and tanks, the machine gun became a powerful and destructive tool. However, the early air-cooled machine guns and the heavier water-cooled machine guns were too bulky for rapid mobility and limited the average foot soldier of the trenches to static warfare. By the end of World War I the Germans had improved the technology in the form of an infantry machine pistol, MP18, a light, mobile infantry machine gun that used pistol rounds.

During the interwar years, development continued on all forms of automatic weapons. Individual automatic weapons such as submachine guns and assault rifles were modified and improved. Submachine guns, smaller and lighter, use pistol rounds, whereas assault rifles were designed to fire rifle cartridges. Assault rifles, on the other hand, combine range and accuracy with a high rate of fire, but the drawback is weight and bulk. Of the lighter weapons, the American-designed Thompson (or Tommy) gun was an excellent submachine gun that fired .45-caliber pistol rounds and came with either 18-, 20-, or 30-round stick magazines or 50- or 100-round drum magazines. Because of their reliability and low cost, these weapons became the favorite of Prohibition era gangsters in the United States.

During the interwar years as well, both light and heavy machine guns were made lighter and more reliable. The Browning Automatic Rifle (BAR) was the American example of an individual combat infantryman's assault rifle. Firing .30-caliber rifle cartridges from a 20-round magazine, the BAR offered the firepower of an automatic weapon with the accuracy of a rifle. The premier U.S. heavy machine gun was the Browning M2 .50-caliber heavy machine gun. This belt-fed, air-cooled weapon could be transported by a two- or three-man crew but was found most often on vehicles and in fortified positions. Further developments included improved machine

guns and machine cannons (by definition with a caliber over 20 mm or 0.8 inch) for use in ships, tanks, and planes.

By World War II the machine gun had come of age. All of the belligerents had developed machine guns for every tactical level. Individual infantrymen used machine pistols and submachine guns for high volumes of firepower and mobility on the battlefields of the world. Combat units and vehicles used combinations of light and heavy machine guns for both offense and defense. In the air, machine guns and machine cannons were adapted for both protection and destruction. With increased mobility and new technological innovations for maneuvering, dynamic warfare was restored in World War II with increased firepower added to the battlefield. During the war, almost all modern militaries switched from bolt-action and semiautomatic weapons in favor of automatic weapons at the individual tactical level, a trend that continued throughout the world in the immediate postwar period.

Following World War II the evolution of weaponry continued, with the machine gun becoming the premier infantry combat weapon, used extensively on every battlefield. Millions of individual soldiers' machine guns were constructed by the superpowers to arm their militaries and those of friendly nations. Increasing efforts were devoted to the development of light and heavy infantry arms, while improvements also continued on machine guns and cannons for use in vehicles. In the case of both portable and mounted machine guns, the emphasis was and continues to be on high volumes of fire, from infantry machine guns that fire at 600 rounds per minute to the U.S. M61A1 Vulcan 20-mm aerial cannon at 6,600 rounds per minute. In addition, designers continue to increase relative accuracy, range, and portability.

The Submarine

Since the seventeenth century, attempts have been made at the design and construction of submersibles, but it was not until the technological advancements became available in the nineteenth century that the first modern submarine prototypes were constructed that could maneuver underwater by their own power.

The first documented submarine was the American *Turtle*, designed by David Bushnell, that was used in an aborted attempt to sink the British ship HMS *Eagle* in New York Harbor in September 1776. As the century progressed this technology was revisited, and submarines were developed in both the United States and Europe. By the time of the U.S. Civil War (1861–1865), both the Union and the Confederacy had submarines of their own. The Union *Alligator* became the U.S. Navy's first submarine, but it was lost in a storm in 1863. The Confederate submarines gained a much more lasting reputation during the war, with CSS *Hunley* being the first submarine used to destroy another vessel when it sank USS *Housatonic* on February 17, 1864. Unfortunately for the Confederacy, their most famous submarine was lost with all hands aboard almost immediately after the action, most likely due to damage sustained in the attack.

One of the main issues with early submarines was propulsion. The question became how to power the submarine and provide breathable air for the crew and still allow for underwater action. One answer was the use of compressed gas, and another was a peroxide-powered engine. But experiments continued with electric and gasoline-powered submarines throughout the late nineteenth century. One inventor, John Philip Holland, an Irishman, made use of a gasoline–electric hybrid engine that proved successful. Holland's improvements led to contracts for his ships from around the world.

By 1914 the majority of military submarines were powered by a diesel-electric hybrid engine.

While navigating on the surface the submarine would use the aspirated diesel engine, and while underwater it would use the electric motors.

World War I introduced the world to the submarine's role in commercial warfare. The British instituted the distant naval blockade, and the Germans responded with unrestricted submarine warfare. The first "Battle of the Atlantic" was under way. The German Type III *Unterseeboot*, commonly referred to as U-boats, searched the North Atlantic for enemy ships to destroy. On May 7, 1915, in one of the most spectacular attacks, the German U-boat *U-20* torpedoed and sank RMS *Lusitania*, killing more than 1,000 passengers including a number of Americans. This event was one in a series that would eventually lead to American involvement in World War I. But even though the submarine did not play a decisive role in war, its potential uses were greatly feared. As a consequence, at the conclusion of World War I the Germans were denied submarines in the Treaty of Versailles.

During the interwar years, the potential of submarines was investigated by almost all of the world powers. Germany, in secret, continued experimenting with submarine development, while the Americans, British, French, Italians, and Japanese began to develop their own submarine fleets.

Interestingly, there was little qualitative difference between the submarines of World War I and those of World War II. In the latter, the submarines were bigger, carried more men and arms, and were faster with longer range, but the engines were still diesel-electric. The Germans had advanced to the Type VII U-boat, the most ubiquitous submarine of the war, while also fielding the highest number of submarines during the war. The Germans were determined to strangle Britain from the sea, especially after the capture of Norwegian ports in the spring of 1940 and French ports later that year.

The commerce war that became known as the Battle of the Atlantic was waged between the German submarine Wolfpacks and the Allied navies and merchant marines. Lessons from World War I were quickly readopted, as shipping was organized into convoys, guarded by the British Royal Navy, the Royal Canadian Navy, and later the U.S. Navy.

Technical evolution continued throughout the war as antisubmarine warfare (ASW) was perfected. From sonar and high-frequency/direction-finding (HF/DF) to the actual weapons used to destroy the submarines, the Allied response to the German U-boat threat was intense. At the height of the German U-boat activity, the Germans sank as much as 5 percent of the total Allied shipping, enough for British prime minister Winston Churchill to comment that the U-boat threat was the only thing that might prevent the Allied victory. During World War II the Germans improved their submarines, adding equipment such as the snorkel that allowed the diesel engines to “breathe” while the submarine operated underwater, thus increasing its submerged speed. By the end of the war (1945) the Germans were introducing the Type XXI U-boat, a new streamlined design with new engines and more power. The *Elektroboot*, as it became known, could travel as fast submerged for short periods as it could on the surface.

In the Pacific, the battle was between the vast fleets of the U.S. Navy and the Imperial Japanese Navy. At the beginning of the war the Japanese had better torpedoes, and their Type 93 Long Lance torpedo was considered to be the best in the world at the time. The Japanese had interesting submarine types, including the largest of the war, the I-400 class that could carry aircraft in a special hangar deck. Although Japanese submarines did sink ships, specifically the I-168 and USS *Yorktown* (CV-5) after Midway, the Japanese submarines were not part of the overall Japanese war strategy and were poorly utilized.

The Americans, on the other hand, were aggressive in the Pacific in their use of submarines to target Japanese merchant shipping as well as military targets. The American submarine fleet was responsible for the destruction of 5 million tons of Japanese shipping, about 60 percent of the total tonnage sunk during the war.

During the two world wars of the twentieth century, submarines evolved and earned a central place in naval strategy. The ability to approach and attack by stealth and to destroy merchant and military shipping will continue to be a critical maritime concern.

➤ EARLY SUBMERSIBLES

Harper's Weekly illustration of a Confederate submarine intended to sink the Union frigate USS *Minnesota*, published in 1861. (Library of Congress)

The earliest submersibles were wooden-construction human-powered antishipping vessels that were both delicate and dangerous. However, they did present a new era of naval warfare that promised stealth, deception, and destruction. Naval theorists had to reconsider their ideas with the introduction of naval warfare in three dimensions.

Aircraft in War

Humans have always had an affinity for flight. From the ancient tale of the winged flight of Daedalus and Icarus to today, flight has captured our imagination. Balloons lifted the Montgolfier

COLONEL WILLIAM MITCHELL

Billy Mitchell, commander of the U.S. Air Force in World War I. (Library of Congress)

An early U.S. advocate of airpower and a very controversial figure, Billy Mitchell remains one of the most influential airpower theorists. With an early interest in flight, Mitchell became the commander of the American air component in World War I. His dedication to and passion for airpower led to conflicts with superiors in both the U.S. Army and the U.S. Navy. He angered the navy with bombing trials of capital ships in the 1920s and alienated his superiors with his open criticism of the way the air services were being handled after airship disasters. Mitchell was court-martialed for his insubordination. He resigned from the army and continued to prophesy airpower until his death in 1936.

brothers as early as 1783, and dirigibles were in use in Europe in the late 1800s. Heavier-than-air experiments were widespread by 1900 with Otto Lillienthal's gliders and the Wright brothers' powered airplane. From the earliest days of ballooning and dirigibles to the advent of

heavier-than-air flight, an interest in the military application of this technology also endured.

After their first flight in 1903, the Wright brothers exclaimed that the invention of the airplane made all further wars obsolete. However, contrary to the Wrights' predictions, aircraft technology was immediately adopted for war-time use. By the outbreak of World War I, aircraft had been employed in a variety of contexts: they had been used in exhibitions to prove their value, they had been used in military reconnaissance, and they had dropped bombs and scared locals. But with the outbreak of war in 1914, no one had a clear conception of how airplanes would be used against other airplanes.

Chivalry in the sky was a myth that grew out of World War I. The truth lay closer to the fact that early airplanes lacked armaments, were severely underpowered, and were not very maneuverable. Thus, at the beginning of the war, pilots were content to let others pass with a wave. But the chivalry of the sky was quickly shattered as pilots sought to deny enemy aerial action. The first use of planes in war was for observation, usually for artillery spotting, while the second use was to block enemy observation. The first aerial combat was quite ineffective, but with the German development of the synchronizer gear, which allowed a machine gun to shoot through the propeller arc along the axis of the plane, the fighter was born. Fighter aircraft were developed to shoot down enemy observers. The Germans started the trend in 1915, and the British and French copied it very quickly. By the summer of 1915, the fighter plane—and the mystique surrounding the fighter pilot—had become a reality. Throughout the war, each side sought to outdo the other with increasingly sophisticated aerial technology. This race culminated in 1918 with a diversity of aircraft, including heavy bombers, fast fighters, close-support aircraft, and transport aircraft. By the end of the war, the aircraft was seen as such an invaluable tool of war that the Germans, in the Treaty of Versailles, were denied military aviation in perpetuity.

The interwar period ushered in an era of both theoretical and technological development. The Italian Giulio Douhet, followed by the American Billy Mitchell and the Briton Hugh Trenchard, became the prophets of airpower. Each preached

the importance of the airplane as an unstoppable platform for future warfare. In their countries, the focus was on the development of large bomber fleets to project power over enemy airspace if the need ever arose. Facing technological constraints, the German military turned its attention to developing aircraft designed for a supportive role of short-range tactical bombing. The Germans focused their efforts on short-range close-air support aircraft. The Japanese, requiring long-range power projection for campaigns, considered naval aviation a key. They built long-range fighters and bombers that could be employed from aircraft carriers. The British, French, and Italians were dedicated to long-range bombing, but this proved to be harder to develop than predicted; all had ongoing problems with the development of bomber fleets. The French were resistant to all but a small amount of military spending, and the British were more successful in developing defensive fighter aircraft. Only the Americans, who dealt with the vast expanses of North America on a regular basis, envisioned the technological issues involved in the development of long-range transports, that is, large multiengine aircraft initially suited for carrying passengers, mail, and goods; this technology was later adopted for excellent American bomber designs.

Technological developments in the interwar period increased the effectiveness of aircraft as tools of war. Bombers were developed to fly higher, faster, and farther and with more bombs than could have been imagined. Fighters retracted their undercarriage into the wings, increased firepower, and set escalating speed records up to the outbreak of World War II. Transports carried greater quantities of goods farther to support troops.

In the Pacific theater, the Japanese ravaged the Chinese with airpower and forced them to turn to the Americans for assistance. The American Volunteer Group (AVG, better known as the Flying Tigers) gained valuable tactical experience engaging Japanese aircraft in the Pacific. The Japanese attack on Pearl Harbor, Hawaii, in December 1941 proved the viability of naval aviation to the entire world.

In Europe, the Germans had perfected the coordination between land and air as they swept across Poland, the Low Countries, and France

in 1939 and 1940. Tactical airpower became the hallmark of German operations, earning the moniker blitzkrieg (lightning war). When the war opened on a wider scale, the aerial component became increasingly important. The Germans could not run an army across the English Channel and had to rely on airpower to defeat England. The Luftwaffe failed, and Britain survived. The Germans used tactical airpower against the Soviet Union but had no long-range bombers for the eastern front.

The Americans and the British responded in Europe with the Combined Bomber Offensive, the Americans bombing Germany during the day while the British took over bombing operations by night. Strategic bombing evolved quickly during World War II, and although it did not live up to the prophesies of the theorists, it was vital in the defeat of Germany.

Interestingly, it was the Germans who had the most technologically advanced aircraft of the war. The Germans were able to field combat-operational jets, rocket planes, and missiles during the war; none of these, however, proved to be Hitler's war-winning weapons. The Germans were simply overwhelmed by Allied industrial output.

In the Pacific, tactical airpower became strategic airpower in the Battle of Coral Sea and the Battle of Midway. Until the Americans had airfields in the Pacific, they relied on naval aircraft and aircraft carriers for the air component in the Pacific war. But with the capture of the Marianas, Iwo Jima, and Okinawa, the Americans were poised to use strategic bombing against the home islands of Japan. Beginning with the firebombing raids against Tokyo and other cities, the ultimate example of strategic bombing came in August 1945 when atomic bombs were dropped on Hiroshima and Nagasaki, leading to the end of the war in the Pacific.

Following World War II, the airplane once again turned to peaceful roles. After the war, developments continued to increase speed, range, and altitude, and the introduction of the gas turbine engine—better known as the jet—led to a revolution in aircraft design and use. Following the war, there was a resurgence of passenger and transport aircraft design that corresponded to public interest in flight and travel.

Poison Gas

During the Second Industrial Revolution of the late nineteenth century, industrial chemistry came of age, and one result was the deployment of poison gas in World War I. After the initial war of maneuver, by 1915 the trench positions of the western front settled into stalemate. Mass human-wave attacks proved to be futile, and new offensive tactics were introduced to the battlefield. One of these was gas warfare.

Chemical warfare was initially envisioned as a nonlethal measure to instill panic in the enemy in the initial phases of an attack. The chemical agents in the earliest gas warfare were projected at the enemy in order to soften up the opposing trenches and create an offensive advantage. The French were the first to use chemical warfare against the Germans in August 1914 although in somewhat negligible quantities. The Germans reciprocated later that year and continued to develop plans and tactics to use chemical weapons effectively.

The Germans, who in 1915 were the first to use gas in large amounts and with tactical considerations in mind, sought to disrupt the Allied lines and gain favorable positions. The first asphyxiant, Chlorine, was intended to cause panic and flight in the enemy trenches and therefore make them easier to overtake. However, as with most chemical agents used in the war, Chlorine was fatal in concentration. The Germans delivered their first tactical gas attacks with artillery shells against the Russians in January 1915, but cold weather made the attack a failure. When the British were attacked near Ypres in April of

that year, the Chlorine gas was brought to the front in canisters; the Germans released the gas by opening the valves and allowing the wind to carry it to the British trenches. Unfortunately for the Germans, prevailing winds in northwestern Europe blow toward Germany, and they had to reconsider the method of delivery. Although the gas attacks at Ypres caused widespread panic and death, the Germans were unable to capitalize on the chaos.

As the war progressed, new chemical agents were used and new delivery methods were adopted. Gas was successfully released from artillery shells so that by the end of the war, one in four artillery shells contained chemical agents. There was even a rudimentary code developed for artillery shells that contained chemical agents; they were painted with crosses based on their contents. The German cross code indicated the effect of the chemical contained and sometimes the actual chemical. White crosses referred to chemicals that affected eyes and moist tissues, blue crosses were upper respiratory tract agents, green crosses indicated lung agents, and yellow crosses were marked on artillery shells that contained chemicals designed to affect the skin and exposed surfaces.

The chemicals came in varying types. The least lethal were the tearing agents, or Lachrymators, that are comparable to modern-day tear gasses. The most common of these were the Bromide family of tear gasses, including the easily produced Xylol Bromide. The next class was the Asphyxiants, or poisonous gasses, like Chlorine and Phosgene. These gasses were fatal in concentration; the latter was twice as effective as the former. These gasses attacked the lungs and eyes, causing severe edema and a painful death. The most infamous chemical agent of the Great War was the blistering agent Dichlorethylsulphide, more commonly known as Mustard gas. The chemical attacked moist skin on the inside and outside of the body and caused large painful blisters wherever it came into contact. It was nearly impossible to protect the entire body from this method of chemical attack, and there were severe casualties due to Mustard gas attacks. As well, this gas was very persistent and remained in low areas for extended periods. Sol-

diers frequently entered areas where Mustard gas remained days after the initial attacks.

The countermeasures to chemical warfare were as interesting as the development of the offensive weapon. As new chemical agents were introduced, new masks and filters were employed to decrease the effectiveness of the gas attack. By the end of the war there were gas masks for men and animals and effective counters to almost all of the offensive chemical agents.

The casualties from chemical agents in World War I were not insignificant; 3 percent of the total killed in the war were from gas (about 300,000 men). The fear of a gas attack and subsequent debilitation as well as the aftereffect of chemical warfare on those who survived was decisive. An unimportant German corporal named Adolf Hitler felt the effects of chemical warfare in the trenches of World War I; although the event was in and of itself insignificant, Hitler's future rise to power influenced the development of chemical weapons in Germany and the Nazis' decision not to turn to chemical weapons for battles. Furthermore, in the aftermath of World War I, chemical warfare was banned during the Third Geneva Convention in 1925.

However, the chemical innovations continued. Again, the Germans led the field with continued research and development in chemistry. During the interwar years populations grew increasingly anxious about future gas warfare, and civil drills included gas masks and shelters. Chemical warfare was used effectively in other theaters of war when the Italians employed gas in Ethiopia and the Japanese gassed Chinese civilians and military in their advance into China in 1941.

The Germans, who began World War II in Europe in 1939, did not use chemical warfare in battle, perhaps because of Hitler's reluctance or perhaps because of concerns over Allied retaliation. But the Germans, and the Nazis specifically, did employ chemical agents in the prosecution of the Final Solution of the Jews in Europe. Building on developments in nerve agents in the interwar period and throughout the war, including Tabun, Sarin, and Soman, the Germans used a hydrogen cyanide derivative, named Zyklon-B, in the extermination camps, including the infamous Auschwitz.

➤ ZYKLON-B

Zyklon-B was originally developed as a delousing agent and was mass-produced by a subsidiary of the German chemical company IG Farben. While its use as a pesticide was widespread both before and during World War II, Zyklon-B would soon take on a far more sinister role. Finding firing squads and hangings to be ineffective execution methods, the Nazis began to construct permanent gas chambers in concentration camps. It was discovered that a single tin of Zyklon-B could kill 250 people in as little as half an hour. This made the mass killings in the Nazi concentration camps possible. One of its earliest documented uses was in September 1941 at the Auschwitz concentration camp in Poland, where 600 Russian POWs and 300 Jews were gassed using Zyklon-B.

Thus, after the horrors of chemical warfare in World War I, the use of chemical agents on the battlefield was for the most part avoided in World War II. However, chemicals were still used to deadly effectiveness in the Nazi concentration camps as well as by the expansionist Japanese. One of the continuing fears throughout military history, which haunts militaries to this day, is the looming specter of chemical warfare on the battlefield or against civilian targets.

Tanks

The addition of the armored vehicle to the military during World War I forever changed the nature of warfare. Building upon the invention of the internal combustion engine as well as new metallurgical and industrial capabilities, the development of a new mobile artillery piece, the tank as it became more commonly known, changed the depth, speed, and tactical fundamentals of war.

Beginning with motorcars and drawing on the need for speed, mobility, and protection on the battlefield, the tank was a natural evolution from the concept of cavalry. At the beginning of World War I mounted cavalry had been marginalized by the stalemate of trench warfare. In an effort to regain mobility, automobiles—with mounted machine guns—were employed as scouts and to harass the enemy. But with little protection and few roads, contemporary cars were ineffective. In response to these limitations, designers substituted caterpillar treads for wheels and created a bullet-proof vehicle that could cross uneven and often muddy ground. These were the first tanks.

The British introduced the tank to the western front in 1916. The Battle of the Somme had become a quagmire, and the new invention was brought to aid the British forces. The brainchild of the Landship Committee (1915), the first British Mark I tanks were rhomboid in shape and thus theoretically better able to cross trenches. They were armed with a six-pound gun on each side but were notoriously slow and unreliable. Their slow speed (three to four miles per hour, or five to six kilometers per hour) made them vulnerable to enemy artillery, and the unreliability of the engines caused frequent breakdowns. The crew compartment was also the engine compartment; the temperature could reach 122°F (50°C) and overheat the crew as well as the engine. Added to this was the fact that there was no clear strategy or use for the new tanks on the battlefield. Theorists alternately saw the tank as the first wave to lead the infantry; others thought that the tank would best survive as an infantry-support vehicle.

After initial failures, tanks became increasingly important to British tactics, eventually

playing a central role at Cambrai in 1917. The British and French were the only ones to put substantial research, development, and industrial capacity into tank development, although they still were unable to turn the tide of battle in World War I. However, the tank was destined to become one of the most influential and most easily recognizable of military technologies.

During the interwar period the evolution of the armored fighting vehicle continued, with improvements in both the technology and strategy. The tank was eventually recognized as an important military machine, and its usefulness on the battlefield was secured. The major militaries of the world implemented tank production and procurement as a central theme in their militaries. As a result, the use of tanks in warfare became a heated discussion in military circles. Theorists argued whether the tank should be treated as an independent actor or as an integrated part of an organized whole.

The Germans, arguably the best at incorporating the tank into operational strategy, organized their land forces around them. As an integral part of army strategy, the tank became the mechanized spearhead in the doctrine of blitzkrieg, or lightning warfare. Lightning warfare was characterized by fast-moving tanks, cooperating with aircraft, as the highly maneuverable first line of attack. The German Mk IIIs and IVs at the start of the war were followed closely by infantry to clean up the attack. This method of warfare worked spectacularly well against the Poles in 1939, against the Low Countries and France in 1940, and in the deserts of northern Africa into 1942. Lightning warfare was less successful in the wide expanses of the Soviet Union in 1941 and faltered as a defensive strategy in the last years of the war. The Germans boasted the best tank technology, culminating in the Panthers and Tigers. But in the end, as in a number of cases with German technology, German production was not up to the task of a two-front war, and after June 1944 the Germans were simply out-produced by the Allies.

Both the Americans and Soviets built tanks that were good enough and in great enough quantities to defeat the Germans. The Soviet main battle tank (MBT) was the ubiquitous T-34.

The Soviet tank, designed around an American chassis, became the mainstay of the Red Army's armor effort. Originally armed with a 76-millimeter (mm) gun, it was eventually upgraded to an 85-mm gun in the T-34/85. Overall, the Soviets produced over 55,000 T-34s of all types during the war. The Americans also had a standard model, the M4 Sherman tank. With a 75-mm gun, it was a good counter to the German tanks and overwhelmed German production in the war in the west after D-Day. The United States produced over 55,000 Sherman tanks during the war for use by all of the Western Allies as well as the Soviets.

In the Pacific theater the Japanese used light tanks for maneuverability, and the Americans countered with more Sherman tanks in the constant struggle over strategic islands. However, the Pacific War was characterized more by ships, amphibious-assault vehicles, and aircraft attacks than by armored assaults.

The evolution of the tank through World War II also coincided with doctrinal development. The change from the World War I idea of the tank as an infantry-support vehicle to the World War II concept of the tank as an independent tactical weapon moving in teams encompassed the range and evolution of tank doctrines. The Germans thought of tanks as separate from the infantry but relied on them in coordination with other weapons systems such as the airplane, thus creating the first fully developed idea of combined arms. The United States took the equation one step further with the incorporation of infantry.

Tank development has continued apace with military history. As with other technologies, the tank has undergone constant improvement in armor, armament, speed, range, mobility, efficiency, and lethality. However, the current doctrine on the use of tanks still follows most of the premises that were worked out on the battlefields of World War II.

➤ TECHNOLOGY AS WAR PROPAGANDA

By 1916, the English and French employed tanks on the battlefield. By 1917, they became a symbol for military might and technological superiority. They quickly became a powerful propaganda tool that signified both material superiority as well as an ongoing request for public funds—in the form of war bonds—for the continuing crisis. In World War I, military technology became a tool to raise money from the home front.

Radio Direction and Ranging (RADAR)

During the interwar years, the idea that “the bomber will always get through” was a fear for citizens in most European countries. Still reeling from the carnage of World War I, there was widespread interest in keeping airspace safe, and as a consequence Europeans worked toward the development of technology that would counter the threat of enemy aerial attacks.

Giulio Douhet, the Italian air theorist, argued as early as 1922 that the heavy bomber was the tool of future warfare. He surmised that with an armada of 500 heavy bombers raining gas and high explosives from the sky, entire cities and countries could be subdued in a matter of hours instead of years. His theory was that four-engine bombers were an unstoppable first-strike weapon designed to overwhelm and destroy enemy morale in the opening phases of any future war. If used effectively, a large group of bombers could destroy an entire city—preferably a capital—and convince a population to surrender. Furthermore, he argued that a heavy bomber fleet could also become an effective deterrent to prevent wars from breaking out.

Other interwar theorists supported and often plagiarized Douhet’s theories. American Billy Mitchell of the U.S. Army Air Corps showed Douhet’s theories in action with bomber experiments in the 1920s. He used planes to sink captured German World War I ships in an effective show of airpower. In England Hugh Trenchard,

chief of the Air Staff for the Royal Air Force, also thought along the same lines. The consensus was that heavy four-engine bombers were the important technological component that would guarantee future airpower and aerial supremacy; there was simply no counter to them.

Technically, the theory was correct. In the interwar period the existing bombers were as fast as fighters and were also more sturdy and had better flight characteristics. Antiaircraft artillery was still in its infancy. The bomber could actually get through. But technological breakthroughs soon overcame the power of the bomber in theory and in practice.

Building on the early discoveries in electromagnetic theory and the more recent work on radio waves, a number of effective radar systems were developed by 1935. Although there were a number of countries working on the technology, the British have been credited with the first successful integrated radar system.

In an effort to create a death ray, that is, a radio transmission that might physically disturb a pilot or an aircraft’s mechanical operation, the British inadvertently created radar. The British found that aircraft were interfering with radio waves and began to investigate. H. E. Wimperis, the director of research at the Air Ministry, appointed Henry Tizard to be the chair of the Committee for the Scientific Study of Air Defense. Although the committee, in coordination with Robert Watson-Watt, concluded that radio waves could not be used as an offensive weapon, it did determine that there were possibilities for defensive uses. A demonstration was held in 1935 whereby an aircraft was detected before it could be seen or heard. Radar was born. Its workings were simple: radio waves were transmitted and then bounced off aircraft and clouds, and the return signal was represented visually on a cathode ray tube (also used in early television screens).

The British moved forward with the development of the new technology as an integrated system. By the start of World War II, the British had a dedicated air defense system that coordinated two radar systems, Chain Home High and Chain Home Low; a central command system called Fighter Command; and excellent interceptor fighter planes. During 1940 the British proved that the systems were effective against aerial

➤ RADAR DURING WORLD WAR II

In the 1930s many nations experimented with radar. By the outbreak of war in Europe in 1939, both the Germans and the British had sophisticated radar systems. The major difference was that the British integrated their systems as an entire defensive package of early warning, signals, and airfields; the Germans did not. Thus, even though the Germans possessed excellent radar systems, they did not use them as effectively as the British.

—Sterling Michael Pavelec

bombers when the British Royal Air Force successfully defended the home islands against the German Luftwaffe (Air Force).

Although the Germans also had highly technical radar, their radar was not part of an integrated system and was therefore poorly coordinated. The Germans preferred to use their radar for tactical rather than strategic operations, with radar sets at the squadron level. Thus, the effort was wasted because the system was not part of air defense strategy. Some of the most recognized German radars included the Freya (1938) and Wützburg (1940).

Throughout the war, the development of radar continued. The first radar stations were very bulky and heavy and were only suited for land-based use. Over time, however, radar was adapted for shipboard use to find ships at sea as well as for use in aircraft. The aerial combat predicted by Douhet came true in the skies over Europe, and the technological battle continued.

The British were the first to use an effective radar-countermeasure with Window in 1943 on a raid to Hamburg. Window was a collection of millions of aluminum foil strips cut to match the German radar wavelength that were then dropped from the attacking bombers, thus confusing the radar and creating an unreadable pattern on the receiver. The German radar detection of the British was foiled for the night as counter-countermeasures were considered.

Radar was also used in planes for finding targets and other planes. In 1943 the British introduced their H2S target-finding radar, which was designed to find ground targets. Although primitive, it gave the British Bomber Command the ability to bomb at night and during unfavorable weather conditions. One ill-advised British system was Monica, a tail-mounted radar warning system that was designed to let the bomber pilots know if there were German fighters following them. Unfortunately for the British, the Germans were actually capable of locating the bombers by the radar signature of the Monica system.

The German aerial radar systems included the Naxos and Flensburg types. Both used in aircraft and both used predominantly at night (as well as the Naxos U for German submarines), they were designed to locate British bombers.

These radar systems were highly successful in the night battles over Germany.

The reciprocal battle between the Axis and the Allies continued throughout the war as each tried to outperform the other and become more effective in the air war. In the end, Allied technology and production capacity prevailed, as the Germans were simply overwhelmed by Allied industrial output.

Radar development has continued, culminating in weather radar systems as well as radar for aircraft, air traffic control, and sea transport safety and identification.

Aircraft Carriers

The great naval theorists Alfred Thayer Mahan and Sir Julian Corbett prophesied that the battleship was, and would always remain, the dominant form of sea power. Writing before World War I and using historical case studies of the British Royal Navy, there was little contention that they would be correct for the foreseeable future. But by 1910 the advent of new technology would reshape the future of sea power forever. Although the theorists were right on grand strategic levels, the aircraft carrier has supplanted the battleship as the dominant weapon on the sea.

Aircraft were married to oceangoing ships very early in the developmental lifetime of both lighter-than-air and heavier-than-air machines. As early as 1910 Americans were trying to use aircraft at sea with the help of the first aircraft carrying ships. USS *Birmingham* became the first ship to launch a heavier-than-air plane, and

The aircraft carrier USS Yorktown, 1939. (Library of Congress)

an airplane landed on USS *Pennsylvania* in a 1911 experiment. The daring pilot in both attempts was Eugene Ely, a demonstration pilot for the Curtiss Aircraft Company.

In World War I the idea of using aircraft with ships was expanded. The British Royal Navy commissioned seaplane carriers and tenders, which carried the seaplanes, lowered them to the water for flight, and retrieved them for maintenance, repair, and long-distance transport. The seaplane tender HMS *Ark Royal* was one of the ships that the Royal Navy committed to operations in the Gallipoli Campaign in World War I. Similarly, the British were interested in balloon ships, naval vessels that carried tethered observation balloons, and these were also used in the Gallipoli Campaign for artillery spotting from offshore.

It was not until the interwar period that serious development of dedicated aircraft carriers took place. Both the ships and the aircraft evolved to the point where they could be used effectively at sea. One of the early problems with aircraft was that they were simply too fragile and underpowered for use at sea. The development of small, sturdy single-engine aircraft—as well as some twin-engine designs—led to a revolution in naval aviation.

The British were interested in naval aviation but did not foresee a strategic necessity for large fleet aircraft carriers. The main improvements came about in two new sea-power countries, the United States and Japan. In the United States the development of dedicated aircraft carriers and naval aircraft was realized with USS *Langley* (CV-1) and reached full fruition with USS *Yorktown* (CV-5). The United States, while still relying on battleships, decided to dedicate material and resources to the development of aircraft carriers.

The Japanese were interested in expanding their empire and controlling the Pacific and naturally turned to aircraft carriers as the backbone of their fleet. The Imperial Japanese Navy (IJN) was severely restricted by the British and Americans in the 1920s and rather than developing a large battleship fleet instead turned to the power-projection potential of aircraft carriers. In addition to some of the finest ship designs—including the fleet aircraft carriers *Akagi*, *Kaga*, *Soryu*, and *Hiryu* as well as the Shokaku-class *Shokaku* and *Zuikaku*—the Japanese also developed some of the finest naval aircraft of the interwar period: the Mitsubishi A6M Zero fighter and the Nakajima B5n Kate torpedo bomber. Finally, the Japanese made the mixture of technology effective with superior tactical and operational cooperation and the finest torpedo of the upcoming war, the Type 93 Long Lance torpedo.

The imperial Japanese fleet was used effectively in an unprecedented attack on the U.S. military installations on Oahu, Hawaii, including the naval base at Pearl Harbor on December 7, 1941. Using a combination of aircraft—fighters for cover and dive- and torpedo-bombers—naval aircraft launched from six IJN aircraft carriers devastated the U.S. military installations in Hawaii and dragged the United States into World War II. The American Pacific aircraft carriers, the original target of the IJN attacks, were not at Pearl Harbor, which was fortunate for the American war effort. But the destruction of the U.S. Navy's battleship fleet (three sunk, five damaged) forced a new strategic doctrine. The U.S. Navy turned reluctantly to the aircraft carrier as its tool for power projection across the Pacific.

The results were a new kind of naval warfare, fought from a distance, and the eclipse of the battleship as the centerpiece of naval strategy. At the Battle of Coral Sea (May 7–8, 1942) and later the Battle of Midway (June 4–6, 1942), the U.S. Navy and IJN fleets did not come within sight of one another; instead they fought at a distance with aircraft. After Midway, American industrial capacity began to overwhelm the Japanese in the Pacific to the point where the Pacific war, like the European theater, would become a battle of resources. By the end of the Pacific war the Americans simply overwhelmed the Japanese with a combination of naval, man-

power, and technological strengths, but in the midst of war it was the aircraft carrier that emerged as the single most important piece of naval hardware, eclipsing the battleship once and for all.

When USS *Missouri* (BB-63) was decommissioned (retired) for the last time in March 1992, the era of the battleship was over. Used extensively in the Pacific war against Japan, including the Japanese surrender ceremony on September 2, 1945, and even refurbished for the Gulf War (1991), the Mighty Mo has now been converted to a museum and memorial to both the war in the Pacific as well as the legacy of battleships. USS *Missouri* sits next to USS *Arizona* at Pearl Harbor, Hawaii, as symbolic starting and ending points of the U.S. involvement in World War II (1941–1945).

In the modern era, the aircraft carrier has eclipsed the battleship as the most important weapons system in every modern navy. As the definitive example of visual power projection, the U.S. Navy, for one, relies on its aircraft carriers as examples of American naval strength and presence around the world.

Electronic Intelligence

From 1900 to 1945, great advances in electronic intelligence (also known as signal intelligence), from radio transmission to encryption machines, allowed for greater military successes by gaining intelligence of enemy objectives in both world wars. Furthermore, these new technologies al-

lowed for the development of military departments specifically assigned with deciphering encrypted messages through the use of statistics or other forms of quantitative analysis, ultimately leading to the development of computers during World War II.

Prior to the outbreak of World War I, the use of radio transmissions to send military commands was scarcely employed by many of the Great Powers. Nevertheless, interception of such messages became the norm. France and Austria-Hungary both set up radio intercept stations near their borders to listen to their neighbors' exchanges. France had a diplomatic code-breaking station next to its northeast border with Germany, and Austria-Hungary was keen on listening to Italian messages sent during the Italo-Turkish War (1911). However, these efforts did not achieve very much in the development of actual strategy for combat operations.

During World War I, the first state to capitalize on listening to enemy objectives primarily through the interception of radio messages was Germany. Early in the war, tsarist Russian radio messages, sent freely over the airwaves, gave German radio operators, who were initially just listening out of curiosity, key information regarding the whereabouts of their troops, their equipment, and their strategies. This led to the ultimate defeat of Russian forces in East Prussia in the Battle of Tannenburg of 1914. This neutralized the potential of a Russian breakthrough into Germany and instead led to Russian forces being expelled from Germany. For the remainder of the war, Austrian and German cryptographers began deciphering Russian messages almost as soon as the Russian command began encrypting them, thereby positioning their troops at an advantage for all subsequent battles. The Italian defeat at Caporetto in 1917 is partly attributed to Austrian knowledge of Italian objectives and positions. French cryptographers were able to decipher German codes along the western front late in the war, thereby allowing Allied forces to halt German advances. Both sides also became quite adept at the interception of telephone exchanges, leading to knowledge of enemy movements. In one case during a battle along the Somme in 1917, the Germans were able to listen in as a British

► PEARL HARBOR AND PRESIDENT ROOSEVELT— THE DEBATE OVER PRIOR KNOWLEDGE

The release of Robert Stinnett's book *Day of Deceit* (1999), which claimed that President Franklin D. Roosevelt had prior knowledge of the attack on Pearl Harbor and allowed it to occur in order to bring the United States into World War II, triggered a polemic debate among historians. According to Stinnett's theory, Allied military and diplomatic cryptographers had been able to decipher Japanese codes prior to the attack and had warned their respective superiors. With this knowledge at hand, Roosevelt supposedly refused to act and thus allowed the attack to occur, thereby ensuring American support for entry into the war. However, some historians argue that although this knowledge existed, it did not trigger any response primarily due to lack of preparation or inattention to what was deemed by government and military authorities something not very likely to happen. Still others argue that Roosevelt knew that something was bound to happen and that he hoped that it would in order for the United States to enter the war.

—Abraham O. Mendoza

officer commanded an order through the telephone, which led to the deaths of hundreds of British soldiers. The most famous episode of the impact of a decoded message during World War I was the case in which the British deciphered the Zimmermann Telegram, which was a German proposal to Mexico to enter the war on the side of the Axis for which it would receive territories lost to the United States in the Mexican War of 1848.

During the interwar period, the creation of cryptanalytic agencies attached to the respective militaries of all major powers advanced the development of automated cryptology. The United States, the Soviet Union, Germany, France, Japan, and Britain all developed signal-intelligence departments specifically aimed at decrypting the military and diplomatic codes of potential enemies. Automated encryption machines were developed to create highly complex messages that, it was assumed, could only be decoded through codebooks given to cryptologists. The German

Enigma was developed as a machine specifically for the encryption of messages and was first available on the domestic consumer market. All other major powers also created their own ciphering machines but developed them in secret. Both sides had successes in deciphering each other's messages early in World War II. Early in the war, British codes deciphered by German Afrikakorps led to German advances against British forces in North Africa. Once the codes were changed, the British were able to turn things around at El Alamein. German radio interceptions by the B-Dienst (Observation Service) of British naval communications allowed them to know about fleet and convoy movements.

Later in the war, Allied successes outweighed the early achievements of the Axis and played a pivotal role in the eventual defeat of Nazi Germany and Imperial Japan. Japanese codes, which relied on the PURPLE encipher machine, were decoded by U.S. cryptologists, allowing them to learn about the attack on Midway in 1942. This knowledge allowed U.S. naval forces to obliterate Japanese forces and end their potential to close off the western Pacific to the Allies. Decryption also allowed the Allies to attain information shared between the German and the Japanese through the Japanese ambassador in Germany, who relayed information back to Tokyo about German positions, troop formations, and plans on both the eastern front and what was to become the western front in 1944. Both Germany and Japan failed to change their encryption machines in a way that might prevent Allied decryption and thus continued to provide valuable information to their enemies. The availability of the Enigma Code to the Allies also proved invaluable in the British operation codenamed Ultra, which deciphered German military codes and contributed to Allied victories. During this time, Britain's Bletchley Park became the nerve center of electronic intelligence in tandem with U.S. Army and U.S. Navy signal-intelligence agencies.

Electronic Communications

The development of electronic and radio communications technologies between 1900 and 1945 for its use as a means of communicating for commercial and military purposes grew by leaps and bounds in the context of the two world wars. At the turn of the century, radio communication was used in a maritime context for ships to communicate with each other and with land-based stations in Morse code for the purpose of navigation. During World War I, radio communications were used by both the Entente and Central Powers to coordinate plans and exchange diplomatic communiqués. However, these became vulnerable to enemy interception, and encryption became necessary to protect sensitive information. During the interwar period and through World War II, the use of electronic communications to coordinate strategy, intelligence, and troop movements became a prevalent form of military communication by all sides.

At the beginning of the century radio communications was an established technology, albeit with limited practical uses. Innovations made in Europe and the United States in the late nineteenth century by Oliver Lodge, Nikola Tesla, Guglielmo Marconi, Alexander Muirhead, and Alexander Stepanovich Popov made radio a viable technology for communications and commercial broadcasting from its theoretical foundations. However, wireless telegraphy's first practical uses were in maritime communications to ensure contact between ships and land stations. Among its most notable initial maritime uses were by Japanese ships in the Russo-Japanese War (1904–1905) and the *Titanic* disaster (1912), both instances that respectively illustrated the value of electronic communications in military strategy and emergency situations at sea.

During World War I, electronic communications were used on a vaster scale to coordinate strategy and to relay diplomatic messages by

THE BRITISH BROADCASTING CORPORATION— COMMUNICATIONS INFRASTRUCTURE

The British Broadcasting Corporation (BBC) established the BBC Empire Service in 1932 to relay radio broadcasts to outposts of the empire in order to maintain the cohesion of the disparate regions that extended the world over. This allowed the British public media service to relay communications from London to the rest of the British dominions, thereby ensuring the cultural dominion of the English metropole. In 1939 the Empire Service was renamed the BBC Overseas Service. During World War II, the objective of the Overseas Service was as a propaganda tool to inform the civilian populations under Axis occupation of Allied ideological objectives and solidarity with resistance movements. BBC subsidiaries, such as the German Service (1939) and the European Service (1941), were established to fulfill distinct objectives in the propaganda war with the Third Reich. Currently known as the BBC World Service, its objective is in relaying British news across the world in multiple languages, now through newer technologies, and is often a means of addressing audiences, offering an alternative to state-controlled media used to manipulate domestic public opinion.

—Abraham O. Mendoza

both the Entente and Central Powers. However, these messages were vulnerable to enemy interception, and subsequent actions made due to the exposure of such delicate information led to the development of encryption systems. Nonetheless, warfare radically transformed the uses of electronic communications as a means to coordinate logistics, strategy, and intelligence. At war's end, radio communications were accepted as a necessity by military institutions in the West as a means of relaying messages to ships, planes, and mass formations in battle, thereby allowing coordination between forces and altering overall military strategies from techniques inherited from nineteenth-century warfare.

Developments in the interwar period related to electronic communications allowed the interception of enemy aircraft, ships, and submarines. The interwar invention of radar in the

West (the British acronym for *radio detection and ranging*) led to its implementation by the British, amid fears of German aerial bombardment, who used radio waves to identify enemy planes and allow for their interception by the Royal Air Force. Moreover, radio communications allowed for coordinated blitzkrieg attacks by German forces, which rapidly destroyed and overwhelmed enemy forces. World War II was characterized by the greater usage of electronic communications by all belligerents, thus allowing for larger movements of troops and material in two global theaters of operations (Europe and Asia-Pacific). Moreover, it allowed for large-scale coordinated offenses on multiple fronts by the Allied armed forces. Radio stations were such a vital part of a state's communications infrastructures that they became viable targets in World War II as a means of disrupting the integrity of the Axis states and their ability to continue the war effort.

Moreover, during World War II the use of radio as a propaganda tool was used by both sides as a means of affecting enemy morale and assuring domestic public opinion of success. Nazi Germany and fascist Italy had used the radio to propagate their ideological messages to their civilian populations in the interwar period. German minister of propaganda Joseph Goebbels (1897–1945) was keenly aware of the power of radio to maintain ideological solidarity across the Third Reich. During the war the Allies, mostly through the British Broadcasting Corporation (BBC) and Voice of America (VOA), relayed their own ideological message to the people of Nazi-occupied Europe of eventual liberation, while the Germans and Japanese countered with messages of false optimism and coming atrocities if the war was lost. Radio commentators, such as Lord Hee Haw, Axis Sally, and Tokyo Rose, were used by the Axis to counter Allied propaganda throughout the war, further illustrating the use of radio to stir public opinion and morale in the context of total war.

Missile

The missile, in its modern military application, did not come into being until World War II. Prior to the war, the concept that would eventually yield the missile was embodied in what is commonly referred to as the rocket. Prior to the twentieth century rockets saw varied uses, ranging from colorful displays in dynastic China to signal flares and eventually light bombardment weapons by European armies. Advanced programs by combatant nations during World War II would bring into existence the guided missile and alter geopolitical and military history.

At the dawn of the twentieth century, the solid-fueled rocket had reached its technological limit. Rockets were in use by most major Western armies as battlefield signals, illumination flares, incendiary devices, and short-range but somewhat inaccurate bombardment systems that were overshadowed by the more powerful and practical artillery systems of the day. The theoretical and practical work of four men would lay the foundation for the next logical stage of development of what would become the liquid-fueled missile: American Dr. Robert Goddard, Russian schoolteacher Konstantin Tsiolkovsky, and German scientists Hermann Oberth and Werner Von Braun.

A gifted scientist, Robert Goddard spent much of the early part of the twentieth century conducting small-scale rocket experiments. He worked for the U.S. Department of Defense during World War I, primarily on rockets. Goddard launched the world's first liquid-fueled rocket on March 16, 1926, from a farm in Auburn, Massachusetts, based on his theoretical designs and concepts. In addition, he would publish several papers detailing the use of such rockets for space travel. Konstantin Tsiolkovsky's work in

this era was primarily theoretical; however, he developed theories on gyroscopic stabilization, the escape velocities from the earth's gravitational field, the principle of reactive action, and the use of liquid propellants for rockets. His Tsiolkovsky Formula established the relationships among rocket speed, the speed of the gas at exit, and the mass of the rocket and its propellant. This fundamental principle remains basic to contemporary astronautics and essential to missile design. In Germany, Dr. Hermann Oberth published some of his landmark works on rockets in the early 1920s. He too was primarily interested in the uses of such rockets for space travel. The technical papers produced by these men inspired young scientists such as Werner von Braun and led to the creation of the Verein für aumschiffahrt (Society for Space Travel).

The theories and work of these men came together in 1932 when Drs. Oberth and Von Braun were put to work by the German Army's newly formed Rocket Research Group. Their designs would eventually lead to development of the V-1 buzz bomb, the world's first operational cruise missile. The V-1 was essentially a liquid-fueled pulse jet engine attached to a large explosive warhead. It was a ground-to-ground weapon system. Massive infusions of capital by the major combatants during World War II would allow for the development of several other rocket-powered and missile weapons by the end of the war.

After extensive research and development, the German V-1 missile was introduced into combat in June 1944, with an estimated operational range of 150 miles (240 kilometers). Thousands of pulse-jet-powered V-1s were launched against targets in Europe, primarily London. V-1s were slow and inaccurate and could be intercepted or shot down by propeller-driven fighter planes. Working under increasingly difficult conditions as the war progressed, von Braun developed the V-2 missile, the world's first large-scale liquid-propellant rocket vehicle. The V-2 was also the first long-range ballistic missile, the original ancestor of today's large rockets and launch vehicles. Unlike the V-1, the V-2 traveled in a suborbital ballistic trajectory at supersonic speed and therefore could not be shot down with the technology of the times. A true missile,

➤ DR. WERNER VON BRAUN (1912–1977)

Werner von Braun holds a unique place in history for his affiliation with the National Socialist Party of Germany, as the designer of the vengeance weapons that killed hundreds of innocent civilians, and ultimately as a pioneering National Aeronautics and Space Administration (NASA) scientist who made the U.S. moon missions possible. As a child, von Braun grew up fascinated by early science-fiction writers of the day and decided to study calculus and physics in college in hopes of working on space travel research. A brilliant scientist, von Braun earned his doctorate in 1934 at the age of 22, just as Adolf Hitler and the Nazi Party were coming to power in his native Germany. With few options to work in his field, von Braun joined the German Army and was placed in charge of its advanced ballistic missile program. A team of scientists under his direction developed both the V-1 and V-2 missiles that were responsible for reigning destruction on London during World War II. Von Braun even made conceptual designs for a multistage V-2-type missile that theoretically could have been launched on the United States from Germany, but this never went beyond the design stage. Facing defeat, von Braun organized the surrender to the Allies of several key German scientists, along with their technical plans and weapons. The U.S. government, seeing his potential, first put von Braun to work for the U.S. Army designing missiles; however, his abilities soon had him assigned to the NASA. Finally able to work on space travel as he had dreamed of as a child, von Braun and his team designed the massive Saturn V rocket that enabled the United States to defeat the Soviet Union in the Space Race to the moon.

—Christopher Ferraro

the V-2 would be the forerunner of the intercontinental ballistic missile (ICBM) developed soon thereafter during the Cold War.

Nearly simultaneously, the Japanese and Soviets acquired missile technology during World War II and quickly applied it to the battlefield but in very different ways. The Japanese Yokosuka MXY7-K1 Cherry Blossom, a crude liquid-fueled manned kamikaze missile, entered service in 1944. The sole use of the missile was to be flown at high speed in suicide attacks at the U.S. Navy.

On the eastern front, the USSR introduced the BM8 multiple rocket launcher, dubbed “Katyusha” by the German Army for its distinctive sound. This small-scale missile had no internal guidance system and had a short-range capability, and thus it was fired blindly in mass quantities at the enemy. The Soviets used the BM8 and similar systems until war’s end. German scientists also developed the Henschel HS 293 A-1, the world’s first air-to-surface missile. The HS 293 A-1 was essentially a glide-bomb assisted by a liquid-fueled rocket engine. On the infantry level, the Germans also introduced the *Panzerfaust*, or “Iron Fist,” a handheld antitank rocket launcher that made use of solid fuel.

A relative latecomer, the United States attempted to develop a remote-controlled cruise missile, the Lark, to intercept kamikaze attacks; however, this system was still under development when the war ended in 1945. The British were also working on a similar weapon when Japan surrendered.

By 1945, all major combatants had either deployed missile systems or had such systems in development. After the war, the United States and the Soviet Union quickly found themselves engaged in an arms race that would take missile technology to its ultimate conclusion, the moon.

Atomic Bomb

The ultimate weapon known to mankind was a direct descendant of war, namely World War II. In the most destructive war to date the power of the atom was harnessed and released in the first, and hopefully the last, atomic attacks. In 1945 the world witnessed the devastation wrought by man’s harnessing the power of the atom.

As early as 1905 Albert Einstein predicted the potential results from splitting the atom.

Throughout the 1920s and 1930s nuclear physics advanced to the point where the idea of harnessing the power of the atom was quickly approaching reality. In three countries specifically experiments were conducted that tested the theories of atomic power. The theory predicted that by breaking apart strong atomic bonds, enormous amounts of energy could be produced. In Germany, Britain, and the United States theoreticians and scientists began examining the possibility of atomic power. In Germany the new National Socialist (Nazi) government under Adolf Hitler forced Jewish scientists and professors from their positions in academia and laboratory research, to the detriment of the German atomic program. But to the benefit of the future Allies, their forced exile from Germany and subsequent immigration to Britain and the United States meant that their research and experimentation continued in their new home countries.

As war loomed in Europe, exiled scientists persuaded Einstein, living in the United States, to warn the American president Franklin D. Roosevelt that the Germans were studying atomic theory and that the United States should follow suit. The Germans had the most developed atomic program at the time and also had access to heavy-water sources, fissile materials, and an almost-completed cyclotron. Einstein wrote the infamous letter in August 1939, a month before the opening of the war in Europe, urging that the United States begin an atomic bomb program. Roosevelt immediately ordered further research into the issue with a contract for experimentation.

After the start of the war German advances were virtually unknown, but American experts assumed that the German atomic program continued. In the United States the atomic program, under the aegis of the National Bureau of Standards, began work in two places: at the Naval Research Labs in Washington, D.C., uranium-isotope separation was investigated, while at Columbia University the physicist Enrico Fermi examined reactors.

In Britain the Maud Committee was appointed to examine the question of what amount of uranium would be necessary for an atomic bomb. The expected amount was revised from tons to pounds, and the committee determined

➤ MUSHROOM CLOUD

The distinctive mushroom-cloud shape generated by an atomic blast is not actually unique to a nuclear explosion but is simply facilitated by the heat and explosive power of the blast. The shape can be replicated with conventional explosives, but it is a characteristic of this type of explosion. The heat, debris, and explosive force of the initial blast creates the cap of the mushroom cloud, which quickly rises due to the intense heat of the explosion. The quick rise of the cap draws in more air and creates a turbulent effect as the cloud rises, creating the stem of the mushroom. The iconic mushroom cloud is therefore created by the initial explosion and the intense heat that causes it to rise.

A dense column of smoke rises more than 60,000 feet into the air over the Japanese port of Nagasaki on August 8, 1945. (National Archives)

that an atomic weapon using uranium was feasible. But in wartime Britain the costs in manpower and money were too high, and the detailed reports were dispatched to the Uranium Committee in the United States.

At first, atom bomb interest in the United States was lax. The United States was not yet at war, and little progress was forthcoming. In August 1941 the British scientist Mark Oliphant traveled to the United States to see what was holding up progress. When he could not persuade Lyman Briggs, the chair of the Uranium Committee, that the project was important, Oliphant contacted his scientist colleagues. Along with the National Academy of Sciences, they persuaded the U.S. administration to fund the project, funding that was dedicated as early as October 1941. Two months later the United States was drawn into the war by Japan.

In Britain a small program, renamed Tube Alloys, was sent to Montreal, Canada, where its researchers could continue their studies. But by

1943 Tube Alloys became a part of the larger American program. In the United States the atomic program began to diverge on two distinct paths. One side of the project was concerned with uranium as the atomic material, while the other examined plutonium for the same purpose. Interestingly, in the end both were successful in developing atomic weapons.

In the summer of 1942 the Army Corps of Engineers colonel Leslie Groves was put in charge of the program to develop the atomic bomb. He named it the Manhattan Project and named J. Robert Oppenheimer as the chief scientist. The program was relocated to Los Alamos, New Mexico, where desolation aided security. The Manhattan Project became America's most closely guarded wartime secret.

By December 1942 Fermi was able to achieve a sustained nuclear chain reaction at the University of Chicago, confirming atomic reactivity. Atomic Materials Production Facilities were erected around the United States for

the development of atomic material, including installations at Oak Ridge, Tennessee (uranium), and the Hanford Site in Washington state (plutonium).

By 1945 the teams at Los Alamos were successful in the creation of three atomic bombs. One was a uranium gun type called Little Boy. The bomb was designed to detonate when an amount of uranium was shot down a tube at another amount of uranium, creating a critical mass for detonation. The uranium used in Little Boy was the isotope uranium 235. The other two bombs, one of which was named Fat Man, were plutonium-implosion bombs. In these, a subcritical plutonium sphere was surrounded by chemical explosives that when detonated caused the sphere to collapse, creating an artificial critical mass. The resulting detonation theoretically would be the atomic explosion. This was by far the more complicated version of the two and was subsequently the first one tested.

On July 16, 1945, one of the plutonium bombs was hoisted up a test stand and detonated at the Trinity Test Site at Alamogordo, New Mexico. The news was good for President Truman, negotiating at the Potsdam Conference over the spoils of defeated Germany and the future of the Pacific war. But Josef Stalin, the United States' Soviet ally at the time, was not equally impressed, as Soviet spies had already informed him of the achievement.

Little Boy was the first atomic bomb used in warfare when it was dropped on the Japanese city of Hiroshima on August 6, 1945. The effects, as predicted in theory, were devastating: the city

was destroyed with one bomb. The plutonium-implosion bomb Fat Man was used three days later on the Japanese city of Nagasaki; the combination of the bombs and the threat of invasion finally forced the Japanese to surrender, ending World War II.

After the war the Allies found that neither the Germans nor the Japanese had atomic programs of note. The Americans, with substantial British assistance, were the only country with the technology until the Soviets exploded their first atomic device, a direct copy of the U.S. plutonium-implosion type, on August 29, 1949.

The Manhattan Project and the U.S. government's decision to use atomic weapons on civilian populations in Hiroshima and Nagasaki during World War II are two topics that maintain a level of controversy to this day. Highly polluted water and land contaminated with radioactive waste in Hanford, Washington, is just one of the legacies of the atomic bomb's development in the United States. From a technological standpoint, the development of atomic weapons, and later atomic power, is a testament to scientific ingenuity in wartime, regardless of the controversial aspects.

■ Introduction: Communication

During the first half of the twentieth century, communication fundamentally changed from what was previously available. To the many inventions made in the nineteenth century to improve communication, the first half of the twentieth century added motion pictures, radio, and television. Most of the communication products created in the nineteenth

century improved communication between individuals. During the twentieth century new products added ways for groups or organizations to communicate to other groups, and mass communication was born.

The first major communication improvement to be commercialized in the twentieth century was the motion picture. At an exhibition in

Paris in 1894, the father of Louis and Auguste Lumière saw a demonstration of Thomas Edison's Kinetoscope, a device that used a band of film, a light source, and a rapid shutter to animate a series of pictures. Inspired to create a motion picture camera that could also project animated images, the Lumière brothers invented the Cinématographe, a combination camera/printer/projector that was hand cranked and weighed less than 20 pounds. The Lumières sent their camera all over the world to collect film, and as a result the Russian, Australian, and Japanese film industries began with the cinematograph.

The United States was the pacesetter for the film industry, however, and New York City was the early center of the motion picture business. The first narrative film was *The Great Train Robbery* (1903). During World War I, Hollywood replaced New York as the home of the movie industry. By 1920 such stars as Charlie Chaplin, Buster Keaton, and Mary Pickford had established themselves. The first talking movie—*The Jazz Singer*, starring Al Jolson—was released in 1927. Movies would become the world's leading form of entertainment until the advent of television after World War II. Although motion pictures were mostly used for entertainment, showings often included short films on such current news events as wars, parades, and speeches. In the 1930s after sound had been added, newsreels covering the week's major events were shown in most theaters along with the movies and proved very popular.

By the early twentieth century, wireless communication began to appear. The first example of wireless communication was the radio. In 1895 Italian inventor Guglielmo Marconi transmitted the first wireless telegraph message. In 1901 he used radio telegrams to communicate with ships traveling across the Atlantic Ocean. From that beginning, voice radio rapidly grew. In the United States, experimental broadcasting to a mass audience started in 1910 with a program by the famous singer Enrico Caruso at the Metropolitan Opera House in New York City. During World War I the demands of military communications sped up the development of radio technology.

By 1920 several experimental broadcasting stations had converted to commercial stations by broadcasting programs on a regular basis, including such news as the results of the 1920

presidential election in the United States. In the United States because radio was a good way to communicate with large groups of people, broadcasting rapidly consolidated into national networks in order to attract advertising revenue to support news and entertainment programming. The Radio Corporation of America (RCA) created the first nationwide broadcast network, the National Broadcasting Company (NBC), in 1926. In Europe and some other parts of the world, governments generally controlled radio broadcasting.

Besides providing entertainment and making money for entrepreneurs, radio also proved to be an important tool for politicians. Perhaps best known are Franklin D. Roosevelt's fireside chats. Leaders in the Soviet Union and Nazi Germany also made effective use of the radio during the 1930s and 1940s.

In the Soviet Union the first experimental radio broadcasts began in 1919. In 1922 a central radio station in Moscow began broadcasting. Two years later regular broadcasts could be heard throughout most of the country. By 1937 there were some 90 radio transmitters in operation. In 1990 there were 168 broadcasting centers and more than 5,000 local stations in the Soviet Union that operated in 72 different languages.

Radio has also become an important means of communication in other parts of the world. In Latin America, for example, radio—and television—are the main channels for transmitting information. In most Latin American countries, they reach far more people than print media due to lower rates of literacy and lack of purchasing power. From the 1930s to the 1960s, many radio stations broadcast radionovelas, serial radio programs similar to soap operas. Early Latin American radio also featured variety shows, dramas, sports, talk shows, and news.

Another important twentieth-century development was television, which would soon overshadow radio and motion pictures. In the United States during the late 1920s, many attempts were made to create an experimental telecast, and a few met with success, particularly RCA's efforts. In the early 1930s the United Kingdom's Electric and Musical Industries designed a television system that was later adopted by the British Broadcasting Corporation. Germany also had some

success in broadcasting at the time. In 1936 NBC provided 150 experimental television sets to homes in New York City and sent telecasts to them; the first show was the cartoon *Felix the Cat*. By 1939 NBC was providing regular telecasts but to a limited market. When the United States entered World War II in 1941, however, all television projects were suspended until the war ended in 1945.

After the war, television development continued where it left off, with the invention of better television sets, creative programming, and larger markets. The first coast-to-coast program was President Harry Truman's opening speech at the Japanese Peace Treaty Conference in 1951. By the 1950s television had become a profitable industry. In 1953 the first color telecast was made, which spread so fast that by the 1960s most telecasts were in color.

—Ronald Young

Radio

The invention of radio opened a new era in communication. As did the telephone, radio made communication instantaneous, but whereas the telephone permitted conversation between just two people, a radio broadcast could reach thousands. In 1921, for example, some 300,000 Americans from Maine to Florida, 100,000 alone in

New York City's Times Square, heard the broadcast of the championship fight between heavyweights Jack Dempsey and George Carpentier. In addition to sports, radio broadcasts included music, humor, speeches, religious services, politics, and propaganda. In reaching thousands, radio had the potential to shape the ideas of people in all walks of life. In its ability to deliver a world beyond the confines of the neighborhood, radio integrated itself into the lives of those who wanted the vicarious experience of living beyond the familiar. Radio became as much a part of the daily routine as the newspaper and small talk between friends and family.

Radio had its roots in the classical physics of the nineteenth century. In 1887 German physicist Heinrich Hertz discovered radio waves, a type of low-frequency electromagnetic energy outside the visible light spectrum. Italian inventor Guglielmo Marconi in 1895 sent Morse code by radio waves, creating the wireless and spurring efforts to transmit the human voice. In 1906 University of Pittsburgh electrical engineer Reginald Fessenden succeeded in transmitting the voice, but the signal was weak and difficult to separate from static. Alert to these problems, Lee De Forest of Armour Institute of Technology led the way in the 1910s in improving the vacuum tube to amplify radio signals and reduce static.

By 1916 David Sarnoff of the Marconi Wireless Telegraph Company in New York City had decided that the future of radio lay not in sending and receiving private messages. The telephone already served this end. Rather, a radio transmitter would broadcast music, speeches, news, sports, and the like to receivers in homes. In 1918 Columbia University electrical engineer Edwin Armstrong invented the superheterodyne circuit to tune a receiver with precision to the frequency of a radio wave. In 1919 Radio Corporation of America (RCA) formed with the aim of realizing Sarnoff's vision and in 1920 gave 10 percent of its stock to American Telegraph and Telephone (AT&T), a move that forged cooperation between the former rivals.

In 1920 Westinghouse Electric launched in Pittsburgh the first commercial station, KDKA. In its first hours on the air KDKA broadcast the election results that Republican Warren Harding had won the presidency. Subsequent broadcasts

Station KDKA in Pittsburgh broadcasts presidential returns on November 2, 1920. (Bettmann/Corbis)

were one hour each evening, although with time the program lengthened. Buoyed by the success of KDKA, Westinghouse established stations in New Jersey, Massachusetts, and Illinois. By interesting people in the broadcasts, Westinghouse aimed to create a demand for radio receivers, in time known simply as radios.

As it had with AT&T, RCA fashioned an agreement with Westinghouse, giving it in 1921 a million shares of stock and 40 percent of the market for radio equipment. Having absorbed its rivals, RCA became the leader in U.S. radio. By 1922 RCA was manufacturing radios that produced sound superior in clarity and amplification to the old crystal set and earphones. Mounted in wooden cabinets, the radio was a piece of furniture that the family could gather around in the evening for the day's news, although in the 1930s cheap portable radios began to erode sales of the large units.

The appeal of radio led to spectacular growth in the industry. By the end of 1921 radio could count just 10 stations in the United States, but by the end of 1922 the number was nearly 350. In 1922 Americans bought \$60 million in radios and equipment, and by 1924 the number had leapt to \$358 million.

Radio spread beyond the United States with the first broadcasts in England, Argentina, and Canada in 1920; in Turkey and the Philippines in 1922; in Mongolia in 1934; in Malaysia in 1937; and in Jamaica in 1939. In the 1920s the fascists in Italy and the Bolsheviks in Russia and in the 1930s the regime of Francisco Franco in Spain and the Nazis in Germany took control of the airwaves, using radio as a disseminator of propaganda. These authoritarian governments used radio to forge consensus and to silence dissent.

Radio allowed people to participate in a common culture. A housewife in Avignon, France, and a salesman in Paris might have little in common other than the fact that they heard the same news every evening at 7:00 p.m. on the radio. In this way radio knitted people into a homogeneous community and diminished the sense of isolation that they might otherwise have felt. At the same time the diversity of programming allowed people to assert their individuality. Catholics, Lutherans, Baptists, and Jews each had their own stations. Like the automo-

➤ RADIO PATENT BATTLES

In 1893 the Serbian American inventor Nikola Tesla allegedly demonstrated at a lecture in Saint Louis the transmission and reception of radio waves through space. In 1897 he was awarded a U.S. patent for the apparatus he used to generate and receive radio waves to control a small demonstration-sized boat.

Despite Tesla's priority of invention and his patent, the Italian Guglielmo Marconi claimed to be the real inventor of radio. His apparatus was so similar to Tesla's that Tesla judged it an infringement of his patent. The U.S. Patent Office several times denied Marconi's application for a patent but in 1905 changed course, awarding Marconi the patent for radio. The public and the scientific community sided with Marconi, who shared the 1909 Nobel Prize in Physics with the German Karl Braun for this invention.

Eager to reassert his priority, Tesla sued Marconi in 1915 but lost. Only after his death in January 1943 would Tesla be vindicated. The Marconi Wireless Telegraph Company sued the United States for infringing two of Marconi's patents for radio. The U.S. Supreme Court decided on June 12, 1943, that Marconi Wireless had no basis for suing the United States because the Marconi patents were invalid, the real patent holder being Tesla.

—Christopher Cumo

bile, radio in the first half of the twentieth century was a technology forged for the masses.

Commercial Radio Broadcasts

Commercial radio broadcasts, or broadcasts that are supported by direct or indirect advertising, developed in the early 1920s. They became the dominant form of radio in France and much of

► COMMERCIAL RADIO BROADCASTS

Although ads were not allowed on British radio stations before World War II, advertisers could still reach British listeners by sponsoring programs on overseas stations. This ad from page 33 of the October 11, 1935, issue of a British program magazine, *Radio Pictorial*, describes a show that Proctor & Gamble sponsored for Oxydol laundry detergent:

“Don’t miss the new Radio Thrill—Carson Robinson and his Pioneers on Radio Luxembourg, Sunday 10:15 a.m. There’s romance in the far, far West and that’s where Carson Robinson and his pioneers take you in this thrilling programme. Plaintative and beautiful songs threaded with stirring tales of Jesse James, Buffalo Bill, Bucky O’Neal, Billy the Kid and other famous adventurers of the new continent.”

—Jennifer Spohrer

North and South America, including the United States, between 1920 and 1945, while national public broadcasting, funded by listener subscriptions or taxes on radio sets, became the norm elsewhere. Commercial radio broadcasters of this period pioneered many of the features common to television broadcasts today such as network broadcasting, game shows, and soap operas.

Prior to World War I, radio was used almost exclusively to transmit telegraph messages. In 1906 American inventor Lee de Forest invented the vacuum tube triode, a modified electric lamp that made radio transmission of speech and music possible, but the tubes remained expensive and experimental. World War I paved the way for the broadcasting boom of the 1920s by creating a supply of mass-produced radio tubes used for military communication equipment. The war also created a potential market for them among radio hobbyists, many of whom served as radio operators during the conflict.

Just after the war, American and European radio manufacturers began setting up commercial broadcasting stations to encourage more

people to buy radio equipment. Radio broadcasting grew rapidly but unevenly over the next decade. A survey conducted by the U.S. Department of Commerce in 1930 found 1,250 radio stations operating worldwide, almost 80 percent of which were in North America and Europe. Economic underdevelopment slowed the growth of broadcasting on other continents except in Australia, New Zealand, Japan, South Africa, Argentina, Brazil, and Uruguay. Not all of these stations operated commercially. In Japan, many European countries, and their colonies, public broadcasting monopolies operated all stations, banned advertising, and relied on taxes or listener fees to finance broadcasting. Elsewhere, however, most broadcasters used at least some direct or indirect advertising to cover their production and operating expenses.

The earliest direct advertisements were brief announcements that the station announcer read directly into the microphone. These announcements were relatively inexpensive—the advertiser usually wrote the text, and stations charged by the word—so even local restaurants, movie theaters, and stores could afford them. Larger companies, particularly manufacturers of brand-name consumer goods such as soap, chocolate, beverages, and toothpaste, hired advertising agencies to create their announcements, which transformed them into the prerecorded 15- or 30-second commercials still common on radio and television today. Agencies also developed the jingle—a short catchy song that was used like a brand name or logo to identify a product quickly and ensure that the listener remembered it—and recorded them onto records for stations to play so that the jingle would sound the same every time.

The most common method of indirect advertising was the sponsored program. A sponsor paid the radio station for a block of airtime and provided a program to fill it that began and ended with a short advertisement for the sponsor’s product. Sponsored programs became more widespread in the 1930s when popular backlashes against radio advertising and, in some cases, government regulation encouraged broadcasters in many countries to reduce or tone down advertising.

In the early 1920s most commercial stations broadcast to a local audience and produced mostly live musical concerts, talks, and also prerecorded record concerts sponsored by record companies in their own studios. In the mid-1920s, however, broadcasters began to increase the power of their stations and form networks of smaller stations linked by telephone lines to reach larger regional or national audiences. By 1932 Radio Luxembourg, for example, broadcast to seven European countries from a single high-powered transmitter. In the United States, most commercial stations joined one of two rival national networks: the National Broadcasting Company (NBC) and the Columbia Broadcasting System (CBS). Sponsors could spend more on a program created for these networks since a single program would reach a larger audience than multiple programs created by many scattered local radio stations. Advertising agencies built specialized radio production studios, permanently staffed by professional producers, writers, and performers, to produce these programs and distribute them to broadcasters over telephone wires or on records.

Since sponsors wanted to attach their names to popular, yet distinctive, programs, radio producers experimented with new formats drawn from popular preradio entertainments such as vaudeville. Radio variety shows featured the traditional vaudeville combination of musical numbers, comedy sketches, and stand-up routines with celebrity hosts such as Eddie Cantor and Bing Crosby. The radio comedy sketch became the forerunner of the modern situation comedy, or sitcom. One of the very first, *Amos 'n' Andy*, drew millions of listeners to their sets for 15 minutes every evening from the late 1920s to the early 1940s. Game shows were another popular radio innovation. One of the most popular in France was *Radio crochet*, an amateur music contest on Radio Cité that substituted a gong strike for the giant hook that had traditionally pulled the worst amateur performers offstage in vaudeville.

In the early 1920s most stations broadcast only a few hours each evening because reception was better at night and more people were at home listening. Evening programs, which targeted a family audience, remained prime time

Freeman Gosden and Charles Correll, two white actors, performing as the imaginary black characters Amos 'n' Andy on their radio program in 1935. Despite its controversial racial politics it remained popular as a nightly radio broadcast through the early 1940s. A weekly version remained on air until 1960. (Corbis)

for radio until the 1950s and were more expensive to sponsor. In the late 1920s, however, stations and advertisers developed daytime programs aimed at women listening while doing housework. The earliest were instructional programs with hostesses who gave listeners recipes and ideas for using the food, beauty, and cleaning products that sponsors manufactured. Soap operas, or serialized melodramas, were another innovation of daytime radio, nicknamed for the dishwashing, laundry, and other cleaning products that often sponsored them.

Commercial radio broadcasts changed in the 1950s and 1960s as families began tuning to television in the evenings instead of sitting down to radio broadcasts. Sitcoms, game shows, soap operas, and other sponsored programs migrated to television, and radio returned to musical programming. Local station announcers, now called disc jockeys (DJs), played records over the air that were paid for by short prerecorded commercials broadcast at intervals between songs.

Film Technology

Film is an art form in which still images photographed in sequence on a celluloid strip are projected to viewers at a speed that creates an impression of continuous movement (“persistence of vision”). The steady rotation of a perforated strip through a film projector is broken into intermittent movement by a gear—the Maltese cross—that pulls film forward one frame at a time so that each still image pauses for a fraction of a second between a light and a projecting lens. The first public demonstration of projected movies (Auguste and Louis Lumière, Paris, 1895) caused an immediate sensation. The evolution of filmmaking technique over the succeeding 50 years was based on improved equipment for recording and projection, changes in the film industry’s manufacturing and marketing methods, and new approaches to presenting understandable, meaningful, and affecting narratives.

Very early films recorded scenes from everyday life. Soon after 1900, filmmakers produced fictional stories portrayed by hired actors, as feature films grew in length as well as sophistication. In the 1910s, D. W. Griffith and cameraman Billy Bitzer invented and improved film language, including innovative techniques (like backlighting, flashbacks, cross-cutting, long shots, and close-ups) for dramatic effect, psychological development, and definition of time and place. *The Birth of a Nation* (United States, 1915) was a technological landmark that illustrated film’s vast narrative range.

Photographed in black and white but often tinted for atmospheric or emotional effects, films before 1927 were silent, having no recorded sound track to accompany the visuals. Audiences followed plot developments and understood dia-

logue by means of title cards projected on the screen. Musicians often played live music to reflect mood. Sound technologies in the late 1920s opened the door to more subtle characterization and sophisticated storytelling. Sound tracks contained dialogue, voice-over, music, or sound effects synchronized (more or less) to the visual images, reinforcing what filmmakers wanted audiences to feel (exhilaration, sadness, apprehension, and so forth). Studios experimented with different sound systems (recording devices, amplifiers, loudspeakers), including phonograph records (“sound on disc”) and methods of converting sound into light waves reproduced on a photographic strip affixed to the film’s edge (“sound on film”). *The Jazz Singer* (United States, 1927) was the first part-talkie, but silents continued to be made and distributed for several more years. *The Lights of New York* (United States, 1928) was the first all-talkie. Many theaters, especially in small towns, were unequipped for sound, and movies were often released in silent as well as talking versions. Western Electric’s sound-on-film system was widely adopted in the late 1920s, and by 1932 most American theaters were equipped for sound.

One outgrowth of the close-up shot was the star system. Appealing actors, promoted in the press, became the first movie stars. Major star attractions of the silent era included Charlie Chaplin, Lillian Gish, Mary Pickford, and Rudolph Valentino. Stars of talking pictures through 1945 included Fred Astaire, Humphrey Bogart, Bette Davis, Jean Gabin, Clark Gable, Judy Garland, Cary Grant, Carole Lombard, and Barbara Stanwyck. Some, like Greta Garbo and Joan Crawford, were successful in silents as well as talkies, but others were unable to make the transition because their voices or diction did not match audience expectations. Paradoxically, one of the best silent films appeared after the effective end of the silent era. Chaplin’s *City Lights* (United States, 1931) has never been surpassed in its carefully crafted evocation of loneliness, altruism, and the human condition.

Some early films were distributed in black and white as well as color versions, with the color laboriously hand-painted on each frame of each print. A number of less-than-adequate two-color processes were available after 1908, al-

though they were untrue to nature but widely used for embellishment. In the mid-1930s, Technicolor Corporation developed a more accurate three-color process. Technicolor cameras employed a light prism to split light coming through the lens into blue, red, and green values, each of which registered on a separate strip of black-and-white film. Positive matrix images from each strip were used to transfer yellow, magenta, and cyan dyes onto the finished print, creating a balanced color picture. *Becky Sharp* (United States, 1935), the first three-color movie, is otherwise undistinguished. Color was often no improvement over the rich visual quality and flexibility of black-and-white film.

Important editing techniques, essential for controlling narrative and suggesting meaning, include cross-cutting (e.g., switching back and forth between sequences set in different locations to heighten suspense, as when a car speeds to rescue a heroine threatened by a ticking time bomb), montage (shots laden with contrast are juxtaposed for effect; e.g., a starving worker's family and a gluttonous factory owner are shown in consecutive shots), and composition in depth (deep-focus photography enabling action on multiple planes within the same shot).

Technologically significant landmarks from 1900 to 1945 include *Gertie the Dinosaur* (United States, 1909), illustrating the technique and capability of animation; *Nanook of the North* (United States, 1922), with gyroscope cameras for innovative pans and tilts; *The Last Laugh* (Germany, 1924), as expressionist cinema showing how set design and the subjective camera influence interpretation; *Greed* (United States, 1924), with its re-creation of a novel in exact detail and shot on location under severe conditions; *Battleship Potemkin* (USSR, 1925), with its dynamic use of montage to jolt and persuade; *The Passion of Joan of Arc* (France, 1928), with close-ups as open windows to the minds of complexly represented characters; *Blackmail* (England, 1929), with its prescient understanding of the creative potential of sound, including the dramatic effects of music and suspenseful interludes of silence; *Triumph of the Will* (Germany, 1935), a virtuoso documentary illustrating the potential of sound and image for propaganda; *The Rules of the Game*

THE INTERFACE BETWEEN PHOTOGRAPHIC AND SOUND TECHNOLOGY

The transition from silents to talkies affected more than an expansion of the filmmaker's ability to express plot and characterization through dialogue. The changes also involved complex trade-offs between sound quality and picture quality. During the silent era, studio sets were lit by noisy arc lamps, emitting bright light that allowed the camera lens to be stopped down to a small aperture ideal for sharp focus and depth of field. Arc lamps could not be used on talking picture sets. Studios replaced them with incandescent lamps, which were quieter but provided less illumination. To compensate for lower light levels, cameras in the early 1930s operated at maximum aperture settings, resulting in softer focus and less depth of field. Technological advances in lighting and faster film stock by the late 1930s allowed a return to the sharper photography seen in many silent films. Switching to color presented new challenges to production methods. Quiet, powerful, and more easily adjusted arc lamps emerged in response to Technicolor cinematography. Kodak's Super XX film stock (1938) was faster than previous options without being significantly grainier, and innovative lens coatings with a microscopically thin layer of magnesium fluoride (1939) dramatically increased the transmission of light.

—Jeffrey Mifflin

(France, 1939), illustrating multifaceted uses of depth of field; *Citizen Kane* (United States, 1941), with its innovative uses of photography and sound (e.g., cameraman Greg Toland's pan focusing and pioneering acoustic effects borrowed from Welles's radio days); *Double Indemnity* (United States, 1944), a seminal film noir illustrating the capacity of lighting for establishing mood and meaning; and *Rome, Open City* (Italy, 1945), the prototypical Neo-Realist film using available light, a mix of nonprofessional and professional actors, and improvisation to craft a poetics of everyday life.

Most feature films were photographed on studio sets or back lots. To make room for bulky equipment, interior sets consisted only of walls that would appear on screen. Facades stood

in for buildings in exterior shots. Rear-screen projection or painted backdrops often combined with live acting to create the illusion that characters were on location instead of in a studio. Film production by the 1940s was typically an elaborate and complex undertaking involving many creative and technical workers. The production credits for *Citizen Kane*, for example, include producers, director and assistant directors, writers and editors, camera operator, assistant cameraman, gaffer, grip, art director, sketch artists, set decorators, wardrobe designers, makeup artists, special effects technicians, sound technicians (production mixers, boom, and special sound effects crew), composers, musicians, and choreographers.

At some point before 1945, film replaced literature as the most popular and influential art form. Using technology-based illusions on screen to realize the vision of writers, producers, directors, and so forth, film has had a major impact on the formation of self-image and the shaping of individual behavior as well as social norms.

Television Broadcasting

Television emerged out of experimental physics. From the late nineteenth century, physicists studying the behavior of electrons had used the cathode ray tube in their work. By 1907 Russian physicist Boris Rosing understood that he could

use a cathode ray tube to project a stream of electrons onto a screen. These electrons would, through pointillism, form an image on a screen. By the 1920s several inventors, among them American Philo Farnsworth and Russian American physicist Vladimir Zworykin, had devised their own versions of television.

Central to the invention of television were improvements in communications, principally in the technology of broadcasting. In the 1920s transmitters broadcast television at the frequencies of radio, between 50 and 10,000 Hertz, or cycles per second. This situation was satisfactory only for the communication of sound. The broadcasting of images required bandwidths up to one million Hertz. In 1936 television transmitters, borrowing from the work of American radio innovator Edwin Armstrong, broadcast the waves that carried voice and images by varying their frequency, the number of waves that pass a given point per second. By 1936 television sets used valves to tune in and to amplify incoming waves or signals. The first television sets needed more than 18 valves to amplify a signal, making television sets expensive. Signals were weak because the Heaviside Layer (part of the earth's ionosphere named after its discoverer, Oliver Heaviside) of the atmosphere absorbed a portion of television waves, reducing the number of waves that reached television antennae. (Curiously, the Heaviside Layer reflected radio waves, allowing their transmission unimpaired.) Television transmitters compensated for this loss in the number of television waves by amplifying them, but this did not eliminate interference from the Heaviside Layer.

In the 1930s television transmitters used a large number of bandwidths. Part of the problem stemmed from the fact that transmitters produced two cycles for each signal, or two waves. One cycle or set of waves was redundant in that television sets did not need duplicate signals to function, and in 1939 engineers designed transmission towers that filtered out one cycle of signals, conserving bandwidth. By the late 1930s television sets used diode valves to separate sound and vision waves. Television sets received these waves with long wires. Television set owners strung wires between chimneys of

► VLADIMIR KOSMA ZWORYKIN

Born on July 30, 1889, in Murom, Russia, Vladimir Kosma Zworykin displayed aptitude in applied science and mathematics at an early age. During summers he helped his father make electrical repairs to his boat, work that stimulated his interest in electricity. A student of Boris Rosing at the Imperial Institute of Technology in St. Petersburg, Zworykin worked on one of the first cathode ray tubes in projecting an image on a screen. Graduating from the institute with honors in 1912, Zworykin studied at the College de France between 1912 and 1914 and at the University of Berlin in 1914. The outbreak of World War I cut short Zworykin's stay at Berlin because the government expelled all aliens from Germany. Returning to Russia, he served in the Signal Corps until 1919, when he immigrated to the United States. Becoming a naturalized citizen in 1924, Zworykin received a PhD in physics from the University of Pittsburgh in 1926. At Westinghouse he worked to refine his iconoscope, an early television set, securing a patent in 1928. Transferring to RCA, Zworykin realized a string of successes in the 1930s, and in 1939 RCA, using an

A man adjusts an early commercially available television set, about 1940. (Library of Congress)

improved version of the iconoscope, televised the World's Fair. Zworykin retired from RCA in 1954. He died on July 29, 1982, in Princeton, New Jersey.

—Christopher Cumo

neighboring houses or between a house and a tree or pole to maximize the reception of television waves.

The early days of television were spartan. Television transmitters did not broadcast programs 24 hours a day, every day of the year, as they do now. Instead, in February 1937 television broadcasters in London offered programs for only 1 hour, five days a week. Broadcasting between 9:00 and 10:00 p.m., television was an event akin to visiting the theater. Like theaters, television aired plays. The first television program, *Picture Page*, hosted a different director each week in staging a play. Between 1936 and 1939 the British Broadcasting Corporation (BBC) broadcast 326 plays. Each play was broadcast twice, inaugurating the concept of rerun.

In July 1937 the BBC telecast Wimbledon tennis matches by short wavelength transmission, an advance over the use of coaxial cable. Short wavelength transmission did not replace

the use of coaxial cable in the early days of television. In November 1937 Bell Telephone made the first broadcast between New York City and Philadelphia by coaxial cable. In 1938 the BBC achieved the first live broadcast of an event. In February 1939 the Radio Corporation of America (RCA) broadcast a program between London and New York City, then a long-distance record. In March 1940 a Boeing 247-D transmitted the first broadcast from an airplane in flight. After 1945 broadcasters would use airplanes to beam television signals back to earth just as engineers now use satellites for this purpose.

On September 1, 1939, with the outbreak of World War II, television transmitters in Britain ceased operation for the war's duration. Necessary for the operation of radar, cathode ray tubes could not be spared for television. Moreover, the transmission of television signals might imperil civilians because enemy bombers could fix their location by tuning into these signals. In 1939 the

United States began television broadcasting. In 1941 before U.S. entry into World War II, the National Broadcasting Company (NBC) and the Columbia Broadcasting System (CBS) broadcast roughly 15 hours of television per week. But like Britain the United States suspended most programming with its entry into World War II in December 1941. Those broadcasters that did not go off the air reduced their schedule to some 4 hours per week.

Having ceased broadcasting in 1939, France, under German control, resumed television transmissions in July 1940. Germany aimed these broadcasts at hospitals in hopes of entertaining wounded Nazi soldiers. Beginning in 1943, Germany broadcast programs from the Eiffel Tower. The French public, hostile to the reality that Germany controlled French television broadcasting, watched little television during the war. According to the French, German broadcasts were poor in quality. The Nazis continued television broadcasting until August 16, 1944, when they abandoned Paris.

In October 1945 television broadcasting resumed in the United States. That month broadcasters televised a rodeo from Madison Square Garden, New York City. On December 1, 1945, broadcasters televised the Army-Navy football game. In 1945 broadcasting resumed in Moscow and Saint Petersburg, and on October 1, 1945, the Eiffel Tower resumed broadcasting under French control. Television spread slowly in the 1930s and more rapidly in the 1940s. In 1936 television sets numbered only 200 worldwide. Whereas Americans owned some 7,000 television sets in 1940, the number leapt to 170,000 in 1945.

■ Introduction: Agricultural and Animal Sciences

From 1900 to 1945, although subsistence farming remained the norm through much of the world, numerous innovations in agricultural and animal sciences allowed for the expansion of crop and livestock production in industrialized nations and in areas of the colonized world. University departments of soil science and government research stations became common in this period. The United States Department of Agriculture, for example, formed its Division of Agricultural Soils in 1894, and for the next few decades, scientists conducted soil surveys across the country. Similar advances were made in the hybridization and development of disease- and drought-resistant seeds. Advances in veterinary medicine included new treatment of ailments of poultry and livestock—horses in particular were of critical economic importance until the 1920s when automated vehicles replaced draft animals and the use of

horses in the military. Mechanized farming, which went into widespread effect in the Soviet Union, the United States, and some colonial regions, in addition to increasing productivity, created social disruptions and could have disastrous environmental effects, particularly when marginal lands were opened to farming. A prime example of such an agricultural disaster was the Dust Bowl in North America, which fostered long-term changes in farm policy and land utilization. Even before World War II, large-scale farms incorporated “factory farming” processes that brought automation and assembly line production to agriculture and animal husbandry as a template for increasing productivity and profits. Moreover, wartime production and domestic scarcity necessitated the development of newer uses of foodstuffs and ersatz substitute products.

—Fred Nadis

Advances in Agriculture— Staple Crops

For millennia, humans have labored to improve staple crops with the goal of higher crop yields and resistance to insects and diseases. The pace of these efforts quickened after 1900, when the science of crop breeding began to draw upon knowledge from the new science of genetics.

Although the Austrian monk Gregor Mendel labored in obscurity, his work in hybridizing pea plants shaped the breeding of crops in the twentieth century. Corn was the first staple crop to benefit from Mendel's work. In 1909 the geneticist George Harrison Shull announced that the inbreeding of corn separated it into homozygous lines analogous to pea varieties and that the crossing of these lines would produce hybrids. Many of these new corn hybrids offered better yields and greater resistance to insects and diseases than traditional varieties. In 1917 the corn breeder Donald F. Jones developed a method of crossing hybrids over two generations to produce seed on a scale large enough to create an industry. Hybrid corn spread throughout the United States in the 1930s and into the developing world in the 1940s.

In Japan the staple crop rice benefited at first less from science than from the care that farmers took in scrutinizing their fields for a plant that yielded well and had a stiff stalk. Around 1900 a farmer found a plant, later named the *shinriki* variety, that thereafter spread into western Japan, while another farmer found what became known as the *kamenoo* variety, which thereafter spread into northern Japan. In contrast to the Japanese method of selecting varieties by inspection, in Taiwan scientists bred rice. Around 1910 Taiwanese agronomists crossed Japanese and indigenous varieties to produce the *ponlai* hybrids. In Korea in the 1930s, the Iri branch of the agricultural experiment station bred varieties that replaced the Japanese varieties that Korean farmers formerly had grown.

The scientists who bred new varieties of wheat concentrated their efforts on resistance to diseases and to lodging, or sideways bending of stems. The English botanist Rowland Biffen in 1910 bred *Little Joss*, the first variety of wheat resistant to the fungal disease yellow rust and suitable for planting on both light and heavy

An Iowa farmer stands in a field of hybrid corn, 1939. Hybrids yielded more corn and stood straighter than the old open-pollinated varieties. (Library of Congress)

soils. In the United States, early efforts focused on the wheat crop in Washington state, where farmers needed wheat that had a stout, short stalk to resist lodging. As early as 1899, the agronomist William Spillman began breeding wheat for resistance to lodging. Yet his hybrids were vulnerable to the fungal disease loose smut. In the following decades new wheat varieties were developed that showed stronger resistance to such diseases.

These advances in the breeding of corn, rice, and wheat underlay the Green Revolution in developing nations. In 1943 the Rockefeller Foundation, eager to replicate around the world the success in breeding staple crops in the United States, Taiwan, and Korea, began to fund further efforts. The ensuing efforts of American agronomist Norman Borlaug and other scientists led to the founding of the International Rice Research

Institute in the Philippines in 1960, the International Center for Wheat and Maize Improvement in Mexico in 1966, and the International Institute of Tropical Agriculture in Nigeria in 1967. The breeding of staple crops had become the focus of international science and economic policy.

Advances in Agriculture—Cotton

After 1900 geneticists turned to the work of geneticist Wilhelm Johannsen to improve cotton varieties. Johannsen had worked with beans by self-fertilizing them and obtained homozygous lines, that is, separate lines that bred true. Thus,

progeny had the same genotype as the parent and were identical. The best of these he selected for planting. Researchers took a similar approach to a heterozygous variety of cotton. When inbred for several generations, it segregated into homozygous lines of cotton, each line different from the others. Scientists selected the best among these lines for planting in the field. Because each variety was uniform, a farmer could count on a homozygous line giving the same performance in the field year after year.

Yet the absence of genetic diversity in a homozygous line hindered the further improvement of cotton and gave rise to an alternate method of breeding cotton: the progeny row method. In this method agronomists bred the uniform lines with a heterozygous variety of cotton, an approach that promised to restore genetic diversity to the inbred lines. In this method, scientists bred the progeny from a single row in the field with a heterozygous variety of cotton to restore genetic diversity to the formerly uniform lines. At the same time agronomist Howard L. Manning and others developed the criteria for selecting the best cotton variety in a diverse population.

▶ COTTON PICKERS

Cotton pickers in Pulaski County, Arkansas, 1935. (Library of Congress)

Prior to the development by John Rust of the first commercially viable mechanical cotton harvester in 1935, sharecroppers and laborers were used in large numbers to harvest the crop. The new

mechanical Rust picker picked cotton by using prongs to unwind the cotton fibers and soon proliferated throughout the Old South and the Midwest. This invention caused significant social changes, such as eliminating the need for large workforces. Small sharecroppers and laborers, most of whom were African Americans, were forced by their unemployment to migrate to urban areas. During the 1930s and 1940s, millions of African Americans took part in the Great Migration from the South to industrial cities of the North and California. This migration caused great demographic, political, and social change in large cities.

Bibliography

Shumsky, Neil Larry, ed. *Encyclopedia of Urban America: The Cities and Suburbs*. Entries 16, 84, and 225. Santa Barbara, CA: ABC-CLIO, 1998.

These two methods, the pure line method and the progeny row method, culminated in the varieties U4 and BP52 (the numbers simply refer to the research plots in which the varieties were grown). In 1935 the cotton breeder William Parnell used the pure line method to select a variety of cotton for breeding with a heterozygous line to obtain U4. Alert to the danger of insects to cotton, Parnell bred U4 with lines resistant to the leafhopper jassid to obtain resistant progeny. Farmers planted U4 and its jassid-resistant derivatives in the Sudan, South Africa, Portuguese East Africa, southern Rhodesia, and Nyasaland. Using the same method, the agronomist Albert L. Stephens derived BP52 in 1938. In 1945 Manning bred BP52 with other cotton varieties to obtain progeny for planting in the field. Farmers planted BP52 and its derivatives in Uganda.

In both the short and long terms, cotton breeding has focused increasingly on resistance to diseases, an area that had received little attention before 1945. In 1949 the first cotton variety resistant to bacteria blight, Albar 49 (in this instance the number refers to the year in which the variety was bred), marked a new era in the breeding of cotton resistant to diseases. Other varieties followed including Albar 51 and were planted throughout Africa. Modern cotton varieties combine high yield with resistance to insects and diseases.

Advances in Agriculture—Sugarcane

After 1900 the improvement of sugarcane drew upon the experience of breeding corn in the United States and rice in Taiwan. These breeding programs improved crops through hybridization. Relying on worldwide sugarcane varieties, scientists developed hybrids not only for yield

This World War I-era U.S. Food Administration poster, "Sugar Means Ships" equates eating molasses and cane syrup with patriotism as the inconvenience of wartime sugar shortages is balanced against the needs of the U.S. military to ship soldiers overseas. (Library of Congress)

and quality of sugar but also, in some cases, for resistance to disease. Farmers tended to eagerly adopt the new hybrids, planting them on as much as 90 percent of their acreage.

Around 1905 breeding efforts in Hawaii yielded H109, a hybrid grown until the end of World War II. In 1932 a cross in Hawaii between Javanese varieties yielded a hybrid that farmers in 1944 planted on 100,000 acres (40,500 hectares). In Australia, the Queensland Acclimatization Society crossed a New Guinea variety with an indigenous variety to yield the hybrid Q813, which farmers thereafter widely planted throughout Queensland. In Barbados, the Imperial Department of Agriculture for the West Indies bred a hybrid useful in areas of high rainfall. The British West Indies Central Sugarcane Breeding Station superseded the Department of Agriculture and in 1937 bred two varieties of sugarcane that farmers thereafter grew widely in Barbados. In 1912 the Java Sugar Experiment Station on the island of Java began a long breeding program that in 1929 culminated in POJ2878, which farmers subsequently planted on 90 percent of the acreage devoted to sugarcane. Scientists worldwide used POJ2878 in making hybrid crosses.

In 1925 the Sugar Producers' Association in Puerto Rico, in the midst of an epidemic of the Sugarcane Mosaic Virus that threatened to end the production of sugarcane on the island, began breeding the crop for virus resistance. The association developed three resistant varieties, and their widespread planting may have saved the cultivation of sugarcane. In 1929 the Experiment Station of the South African Sugar Association imported varieties of sugarcane from India and Mauritius and with them bred a hybrid subsequently grown in South Africa, Queensland, the Philippines, and Taiwan. In Mauritius, the Sugarcane Research Station, beginning its work in 1930, used the Javanese variety POJ2873 to breed a variety that farmers then planted widely on the island.

After 1900 the cultivation of sugarcane was as much science as economic activity. The improvements in sugarcane have sustained its cultivation worldwide as new hybrids replaced old ones. In many cases farmers were eager to plant new hybrids. Others, however, were accustomed to planting one variety for several years and confronted with anxiety a new way of agriculture in which varieties replaced one another nearly every year, much as new automobiles made old ones obsolete. In an environment in which farmers were hard-pressed to distinguish one hybrid from another, they became beholden to scientists to tell them which variety among the new releases was best for their soil and climate.

—*Christopher Cumo*

Advances in Veterinary Medicine

The early to mid-1900s was a time of flux in veterinary medicine. An initial period of retrenchment of veterinary practices and schools was followed by resurgence, growth, and diversification. Key advances included a shift in the core of veterinary practice from the farming industry and horses to small animal medicine; the creation of major international societies serving agriculture and animal science; numerous medical discoveries, especially new vaccines; and the official entrance of women into the veterinary profession.

In 1905 delegates at the eighth World Veterinary Congress held in Budapest passed a resolution to establish the Permanent Committee for International Veterinary Congresses as a connecting link between worldwide congresses and events. The committee represented more than 30 countries, each with a national subcommittee. It later became the World Veterinary Association, which is now the recognized world body representing the veterinary profession. Several other international societies were created during the early to mid-1900s, including the International Dairy Federation (1903), the International Association of Instructors and Investigators in Poultry Husbandry (1908), and the Permanent International Committee for Genetic Congresses (1911). On October 16, 1945, the Food and Agriculture Organization, a world body that aimed to improve agricultural methods and promote food security, was created in Quebec, Canada.

There were a number of key medical discoveries in the early to mid-1900s. In 1906 Marion Dorest, W. B. Niles, and colleagues at the Bureau of Animal Industry near Ames, Iowa, developed a vaccine for hog cholera, a disease that had caused enormous losses in the swine industry. In 1926 George William Dunkin and Patrick Playfair Laidlaw at England's National Institute for Medical Research Farm Laboratories isolated the canine distemper virus, which led to commercial vaccine production in 1929. This was followed in the 1930s by the development of vaccines for feline distemper. Veterinarians worked on a range of other diseases, including rabies and foot-and-mouth disease, set against a backdrop of major scientific advances by nonveterinarians such as the discovery of insulin (1921–1922) and penicillin (1929) as well as the development of typhus and yellow fever vaccines in the 1930s. Veterinarians were also influential in improving human surgery techniques, which were initially performed on animals.

The mainstay of veterinary medicine in the early 1900s was the farming industry, particularly horses. There was a substantial societal demand for horses, used as draft animals in agriculture, construction, and transportation. There was also a need for horses in both world wars for use in cavalry units, transport, and logistical support. The development of the

automotive industry, especially substitution of tractor power on farms (the first Ford tractor was mass-produced in 1917), led to heavy mechanization in transport and agriculture. Consequently, there was a postwar decline of the horse industry, which resulted in a decreased demand for veterinarians.

Another setback for veterinary medicine was the economic depression. In the United States, the severe agricultural depression in the 1920s, followed by the financial panic and onset of the Great Depression in 1929, led to widespread farm closures, rural poverty, and the closure of many veterinary practices and schools. The veterinary industry gradually recovered from the late 1930s and early 1940s onward, in line with overall economic recovery. Also, in the United States there was renewed demand for veterinarians following the passage of the Food, Drug and Cosmetic Act by Congress in 1938 that required animal safety tests on proposed drugs.

Veterinarians could no longer rely on equine medicine, and from the 1940s onward they began to specialize in the treatment of domestic animals such as cats and dogs. Many pet hospital facilities were built during this time, a trend supported by a marked increase in pet ownership, a nascent pet food industry, and changing public attitudes regarding willingness to spend money on pet care.

During the early 1900s women officially entered the male-dominated veterinary profession. In 1903 Mignon Nicholson was the first American woman to graduate with a veterinary degree (McKillip Veterinary College in Chicago), followed in 1910 by Elinor McGrath at Chicago Veterinary College and Florence Kimball at New York State College of Veterinary Medicine. Other countries followed suit. In 1905 Belle Bruce Reid qualified as a veterinarian in Australia, in 1922 Aleen Cust registered as a veterinary surgeon in the United Kingdom, in 1928 E. B. Carpenter was the first woman to graduate from a Canadian veterinary college, and in 1935 V. B. D'Apice earned a veterinary degree in Brazil at São Paulo's College of Veterinary Medicine.

Animal Rights Movement

Animals and humans have maintained a close relationship for thousands of years. Animals provided food and muscle for work, especially in the time before the internal combustion engine. Some religions, like Hinduism, have always preached a respect for animals as a part of the faith, but the animal rights movement is a relatively new phenomenon and is limited largely to western Europe and the United States. Stressing that animals have inalienable rights like human beings, animal rights advocates created a powerful broad-based, long-lasting movement in the 1960s.

During the last part of the nineteenth century and the first part of the twentieth century, the animal rights movement centered around antivivisection. Vivisection was the practice of dissecting living animals, especially dogs, to study their internal workings and use that knowledge in human medicine. In Germany during the 1880s and 1890s, antivivisectionists proposed legislation to outlaw the practice without success. In Great Britain, the Act to Amend the Law Relating to Cruelty to Animals in 1876 restricted vivisection by requiring a license. Besides raising awareness of animal cruelty, the antivivisection movement also caused some to question the appropriateness of government regulation of science. In addition, the movement allowed women to assume a greater leadership role in public organizations. Many feminists and suffragists were prominent leaders of the movement.

The rise of totalitarian regimes during the twentieth century affected the treatment of animals in Europe. The Nazis had a nontraditional view of people's relationship with animals. Some animal species were considered favorably and held in higher esteem than some humans. Adolf Hitler, a vegetarian, abhorred vivisection and kosher butchering methods. He and his followers identified them with Jews and outlawed them soon after taking power. Other laws were passed to limit animal suffering, including limits on the ways lobsters were cooked. Endangered species,

like bears and wild horses, were protected by legislation. Other species, including German shepherds and beasts of prey, were held up as ideals of the spirit of National Socialism. In contrast, the Soviet Union accepted Karl Marx's theory of humans as superior to animals because of their control over the environment. The Soviets destroyed animals and the environment in large parts of eastern Europe and their own territory during their efforts to industrialize.

After World War II the animal rights movement entered a new era. New activists included in their critique of animal mistreatment not only

conservation but also the protection of animal species from any manipulation by society, including the use of animals for food.

■ Introduction: Scientific Theories

The first four decades of the twentieth century witnessed numerous advances in the area of theoretical science, particularly in the fields of physics and genetics. At the turn of the century, German physicist Max Planck asserted that energy came in tiny units, called quanta. In addition, sunlight also came in quanta, in what fellow German physicist Albert Einstein called photons, and Einstein demonstrated that these photons of light have enough energy to dislodge electrons from their atoms. Photovoltaic cells, which capture these electrons as electricity, became popularized at the 1933 World's Fair in Chicago.

Early in the century, Einstein contributed two theories of relativity. The first, the Special Theory of Relativity (1905), posited that the faster an object moves, the slower time ticks for it and the smaller the object becomes. In principle, Einstein's Special Theory of Relativity should make time travel possible. Perhaps more importantly, the Special Theory of Relativity demolished the traditional notion that time was universal, ticking at the same rate everywhere in the universe. The General Theory of Relativity (1916) posited that massive objects distort space. The sun, for example, warps space so that the planets follow elliptical orbits around it. What Isaac Newton called gravity Einstein believed to be the distortion of space around massive bodies.

As an outgrowth of nineteenth-century physics, twentieth-century physicists revived the ancient idea that matter is composed of atoms. Far from being uniform, atoms contained a tiny dense nucleus, and the nucleus, having protons, was positively charged. The electrons in an atom are negatively charged so as to make an atom electrically neutral. In 1911 British physicist Ernest Rutherford determined that an atom is mostly empty space, and others such as Einstein understood that the nucleus contained enormous energy. It would be this atomic theory that made possible the construction and use of the atomic bombs that ended World War II.

In 1927 German physicist Werner Heisenberg posited that one cannot know both the position and speed of an electron. That is, at the quantum level, reality is unknowable. From this discrete principle, social commentators interpreted the Uncertainty Principle to challenge the conventional belief that one could know a set of propositions about reality with certainty. However aptly, the Uncertainty Principle has taken on an existence beyond science. As much a philosophical as a scientific belief, the Uncertainty Principle underscored the notion that human knowledge is imperfect.

In a major advance for the earth sciences, German meteorologist Alfred Wegener asserted (1912) that the continents had once been a single landmass (Pangea) that over millions of years

had moved slowly to their current positions. This theory of Continental Drift undermined the conventional view that the continents had always been and would continue to be at their current longitude and latitude. Wegener's theory explained how distant continents had come to have the same plant species.

In the field of genetics, the rediscovery of Gregor Mendel's paper on pea hybridization in 1900 led to developments in the discipline. The first practitioners of this new science sought to determine the relationship between genes and chromosomes. American cytologist Walter Sutton suggested in 1902 that chromosomes contained genes, and between 1909 and 1915 American embryologist Thomas Hunt Morgan proved Sutton correct and demonstrated that chromosomes contain a linear arrangement of genes. The fact that chromosomes contain proteins and Deoxyribonucleic Acid (DNA) raised the question of which molecules contained hereditary information. In 1944 Oswald Avery and his colleagues at Rockefeller Institute confirmed that DNA was the molecule of heredity. After World War II, the American James Watson and his British colleague Francis Crick would discover the structure of DNA.

The new science of genetics offered new fodder for the quasi-scientific field of eugenics, with alarming social repercussions. Just as Austrian monk Gregor Mendel had found that single genes coded for traits in pea plants, eugenicists posited that one or at most a few genes coded for intelligence, diligence, thrift, criminality, insanity, sloth, and prodigality. Because eugenicists believed that heredity was destiny, they encouraged the reproduction of the intelligent and industrious and discouraged the breeding of idiots and criminals. When voluntary measures achieved little, eugenicists clamored for laws to sterilize the feeble-minded, the criminals, and the insane. In the United States, eugenic theories aided new efforts at curtailing immigration, while surgeons sterilized approximately 60,000 people, one-fifth of them in California, between the 1920s and 1960s. Between 1933 and 1937 Germany sterilized 400,000 detainees in prisons and mental institutions. Beginning a euthanasia program in 1939, the Nazis had killed 70,000 mental patients by 1941.

In all of their manifestations, the making and testing of scientific theories define science as a discipline and distinguish it from other forms of knowledge. Over the long term, the fashioning of theories has lent authority to science, with the public and, to some degree, scientists conferring greater prestige on theoretical disciplines than on disciplines that are more descriptive than theoretical. Scientists fashion theories, often in the form of mathematical formulae, with the aim of substituting subjectivity with objectivity. To the degree that it is possible to be objective, a scientific theory represents an advance over nonscientific methods of thought. Scientists' misadventures with eugenics, however, indicate that supposed objectivity may instead be quite subjective and dependent on one's prejudices, with scientists no exceptions.

Quantum Theory

At the end of the nineteenth century, American physicist Albert A. Michelson believed that physicists had described the workings of the universe in all their particulars. Perhaps a few discoveries awaited detection, but physicists should expect nothing revolutionary. Quantum theory ended this complacency, revealing a subatomic world that contained particles that behave like waves and waves that behave like particles. Even light behaves as both particle and wave. Quantum theory conceives matter and waves as behaving according to probability rather than certitude. This unsettling new understanding has been at the core of physics since the early twentieth century.

Quantum theory began as an investigation in thermodynamics. Every object that absorbs energy radiates some of it as heat. In the nineteenth century, German physicist Robert Kirchoff had conceived an object (a blackbody) that radiated as heat all the energy it absorbed. In other words, a blackbody is a perfect transmitter of heat. Kirchoff and others determined to quantify this heat mathematically but were puzzled by the discrepancies between their equations and the amount of heat that a blackbody radiated. In 1900 German physicist Max Planck,

alert to this problem, resolved the discrepancies by deriving an equation that precisely described the amount of heat that a blackbody radiated. Planck included in his equation a constant that required the energy of a blackbody, or any object for that matter, to be calculated in tiny units, which he called quanta. In 1900 Planck seems to have thought of a quantum as little more than a mathematical convenience and not as a physical description. He did not think that quantum theory was revolutionary.

An early advocate of quantum theory, German physicist Albert Einstein extended the theory to light in 1905. A tenet of nineteenth-century physics held light to be a wave. Einstein, however, used quantum theory to demonstrate that light is a particle. He understood that when light shines on a metal it can knock electrons free with its energy in some measurable multiple of a quantum. Because the energy from light comes in quanta, light must be composed of quanta. Light therefore was not simply a wave but also a particle. Einstein had taken a step beyond Planck in ascribing reality to the quantum.

In 1913 Danish physicist Neils Bohr applied quantum theory to the behavior of electrons in an atom. He asserted that electrons occupied fixed orbits around the nucleus of an atom. Upon absorbing energy in some multiple of a quantum, one or more electrons move to a higher orbital. Conversely, an electron, in falling from a higher to a lower orbital, radiates light as energy in some multiple of a quantum. From his model, Bohr derived the spectrum of hydrogen, substantiating quantum theory as a tool of atomic physics.

French physicist Louis de Broglie demonstrated in 1924 the dual nature of an electron as both a particle and a wave, a tenet of quantum theory. Noting, as Bohr had, that atoms emit light with energy in some multiple of a quantum, de Broglie asserted that electrons must orbit the nucleus of an atom as a wave and with energy equal to some multiple of a quantum. In behaving like a wave, an electron was not therefore solely a particle but rather had the qualities of being both matter and wave.

Seeking a rigorous mathematical model for the Bohr and de Broglie atoms, Austrian physicist Erwin Schrodinger in 1927 derived a single set of

equations that predicted the energies and locations of electrons. The fact that these energies were yet again some multiple of a quantum provided another confirmation of quantum theory.

The architects of quantum theory sought a philosophy that made sense of a theory that allowed matter to behave as a wave and a wave as matter. As such, in keeping with Schrodinger's model of an atom, they treated the behavior of electrons in terms of probability rather than certainty. The notion that quantum theory dealt with probability rather than certitude disturbed Einstein, who, although an early advocate of quantum theory, distanced himself from it. He even declared that "God does not play dice," a colorful way of saying that the universe does not behave according to probability but instead according to fixed physical laws.

In 1927 Bohr defended quantum theory with the complementarity principle. Paradoxical as it seems, a phenomenon may at the same time hold two incompatible properties. An electron, physicists knew, is both a particle and a wave and will display the property that an experimenter seeks to measure, not because that property alone defines the electron but because the instruments used to measure it can detect only one property. Apart from the measurement of a property, an experimenter can know nothing definite about an electron. Bohr's position came to be known as the Copenhagen Interpretation.

Schrodinger rejected the Copenhagen Interpretation with a thought experiment. Suppose one puts a cat in a chamber in which the cat faces some probability of death. The Copenhagen Interpretation would define the cat as both alive and dead. Upon opening the chamber door, however, one would verify that the cat was never both alive and dead but instead was only one or the other. Should the cat be dead, its status is irrevocable. No amount of trials in the chamber will restore it to life.

Einstein and Bohr joined the issue, debating the Copenhagen Interpretation for more than a decade. Bohr persuaded Einstein of several particulars of quantum theory, but in the end both men held their ground: Einstein rejected the probabilistic nature of quantum theory, and Bohr defended it. Despite their disagreements, they remained friends.

Quantum theory, over the long term, has explained and predicted the behavior of subatomic particles with great success. The results of experiments have strengthened rather than weakened quantum theory, and it now has few detractors. Accurate in the subatomic world, quantum theory makes no predictions about the macroatomic world described by Einstein's special and general theories of relativity. Physicists, Einstein among them, have sought to unify quantum theory and relativity in a so-called theory of everything. String theory may do just that.

Relativity

Relativity is a theory of physics that describes the properties of space, time, and gravity. It was developed by Albert Einstein (1879–1955) during the first two decades of the twentieth century and is commonly split into a restricted version known as special relativity and a more complex and widely applicable form known as general relativity. It is one of the most successful theories in modern science and remains largely unchanged since its inception. Relativity remains a major research area in physics and provides the foundation for the current efforts to develop a theory of everything.

In 1905 German-born Albert Einstein, working as a patent clerk in Switzerland, published his theory of special relativity based on two basic principles: the laws of physics are constant in all inertial reference frames (meaning an observer who is not accelerating), and the speed of light is constant. Einstein constructed a series of thought experiments to show the consequences of these postulates for moving observers. In particular, he showed that observers taking measurements of length and time while moving very

fast (near the speed of light) can disagree about how long an object is (length contraction), how much time has passed between events (time dilation), and whether two events happened at the same time (relativity of simultaneity). Einstein emphasized that there is no one privileged observer whose measurements are correct; instead, all observers are equally valid. This is the origin of the name “relativity,” although Einstein did not give his theory that name and never liked its implication of relativism. He unsuccessfully tried to call it invariant theory to emphasize the constancy of the laws of physics in his theory. In 1907 he deduced a further consequence of his theory: an object's mass increases as it moves faster and faster, with infinite mass at the upper limit of the speed of light. This is a result of the equivalence of mass and energy as expressed in his famous equation $E=mc^2$.

Special relativity was not immediately accepted. It was unconventional and broke with many of the assumptions of Newtonian physics, which had been the dominant view of physics for 200 years. Einstein, for example, banished as superfluous the notion of an “ether” or hypothetical all-pervading substance that provided the medium for optical and electromagnetic effects. Not only did special relativity break with convention, but it was difficult to confirm experimentally since the phenomena predicted only appeared at very high speeds.

Einstein continued to try to expand and improve special relativity. He spent many years working on a version that included accelerating observers. This would become general relativity, which was based on the principle of general covariance (the laws of physics appear the same to all observers anywhere) and the equivalence principle (an observer cannot distinguish locally between constant acceleration and gravitational attraction).

Einstein began a long search for appropriate mathematical equations, eventually adopting the ideas of the mathematician Hermann Minkowski (1864–1909). In 1908 Minkowski showed that he could describe time dilation and length contraction by postulating a space-time continuum in which space and time were fundamentally linked in a four-dimensional (three dimensions of space and one of time) universe. Einstein at

➤ ALBERT EINSTEIN (1879–1955)

(Library of Congress)

Albert Einstein was born in Ulm, Germany, on March 14, 1879. He studied physics and mathematics at the Swiss Federal Polytechnic during 1896–1900 and became a Swiss citizen. In 1909 Einstein's academic career finally took off, and he went to Berlin in 1914. His social

recognition in Germany peaked, and he won the Nobel Prize in Physics in 1921. In the interwar years he became a target for anti-Semitism among his colleagues. When the Nazis came to power in 1933, Einstein was guest lecturing in the United States; he denounced the regime, one of the first German scholars to do so. He never returned to Germany and continued his work at Princeton University.

During World War II Hungarian émigré scientists Leo Szilard and Eugen Wigner persuaded Einstein to sign a letter warning President Franklin D. Roosevelt about the likelihood of a German atomic bomb project. This prompted the U.S. Manhattan Project and the development of the bombs that later destroyed Hiroshima and Nagasaki. After the war Einstein, a staunch lifelong pacifist and Zionist, frequently jeopardized his reputation by opposing nuclear weapons and McCarthyism and by expressing support for the civil rights movement. Yet the right-wing American establishment failed to discredit him. Today, Einstein remains the most famous physicist of the twentieth century.

first resisted this as too complex but soon accepted space-time as necessary for the further development of his theory.

Einstein had a difficult time developing the equations of four-dimensional space-time. Eventually, in 1915, he found equations that predicted that masses, such as planets and stars, bent or warped the space-time continuum around them. Objects present in warped space-time were predicted to move in particular ways, and this motion was what humans observed as gravity. Einstein's equations could explain the movement of the planets just as precisely as Newton did, but he replaced the force of Newtonian gravity with abstract properties of space-time itself.

Einstein derived three observable tests of his theory. The first was that planets close to the sun would have their orbits modified so that they would wobble slightly, an effect called precession of the perihelion. This had already been observed in Mercury's orbit, and relativity's ability to explain it was a major success for Einstein. Second, Einstein predicted that the warping of space-time near the sun would deflect light from distant stars as it passed. This would be seen as

stars appearing to be displaced from their normal places in the sky and was observed in 1919 by the British astronomer A. S. Eddington shortly after the end of World War I. This scientific collaboration by scientists from recently warring nations was celebrated as an example of scientific internationalism. The third test, the gravitational redshift, predicted that light coming from the surface of a massive body such as the sun would be slightly redder than normal. This test was very difficult to carry out at the time (it was not successfully performed until 1923), and general relativity was accepted largely on the strength of the first two tests.

Einstein became famous after 1919 as the man who overthrew Newton and transformed our understanding of space and time. Einstein became an iconic scientific figure and was asked to speak on everything from politics to religion. Relativity became a subject of popular fascination, and there were many books, magazine articles, and radio lectures that tried to explain the new conceptions of space and time. Writers, philosophers, poets, and artists around the world created work inspired by the new relativistic universe.

Beginning in the 1920s, general relativity was used by astronomers to try to understand the structure, history, and eventual fate of the universe, a field of science now called cosmology. The mathematical tools of the theory were combined with observations made by figures such as the astronomer Edwin Hubble to conclude that the universe was, in the distant past, very densely packed into a singularity, a point of space-time so intensely warped that it cannot be accurately described with relativity. Georges Lemaitre suggested that this initial singularity had exploded, resulting in the expanding universe we see today. This model of the universe, known as the Big Bang Theory, became widely accepted by the late 1960s as evidence for it (such as the cosmic microwave background) accumulated. General relativity still forms the basis of cosmological theory today.

Several alternative theories of gravity have been proposed since 1915, but none have replaced relativity. However, most physicists acknowledge that it cannot be a complete theory because it is not compatible with quantum mechanics, the other great twentieth-century theory of physics. Physicists have been attempting to reconcile relativity and quantum mechanics in a theory of everything since the 1920s, with little success. String theory, also known as superstring theory, is one currently promising approach to this problem.

Atomic Structure

The fifth-century BCE Greek philosopher Democritus believed that matter could not be subdivided to infinity, arguing that in the process of

subdividing matter into smaller units one must reach a substance that can be divided no further. Democritus termed this substance “*atomos*,” meaning indivisible. This substance, the atom, comprises all matter, and Democritus thought that the shape and arrangement of atoms gave different materials their characteristics. Atomic theory had detractors, among them Aristotle, whose influence marginalized it for the rest of antiquity and the Middle Ages. In the early nineteenth century, British chemist John Dalton revived atomic theory, thinking of atoms as tiny solid balls of uniform consistency and with no internal structure.

Dalton's thinking about atomic structure ran into trouble in the late nineteenth century. In the 1870s, British physicist William Crookes (1832–1919) passed an electric current through a vacuum, believing that the current emitted from the cathode, the negatively charged wire, was composed of particles. His compatriot Joseph J. Thomson (1856–1940) agreed, and in 1897 he found the mass of these particles to be a minute fraction of the mass of a hydrogen atom. This finding led Thomson to realize that atoms must contain these tiny particles, which he termed “electrons.” Thomson thought of the atom, far from having no internal structure as Dalton had believed, as a sphere with positive charges and electrons distributed more or less evenly. The atom was neutral: positive charges counterbalanced the negative charges from the electrons.

Intent on elucidating the atom's structure, between 1906 and 1909 New Zealand physicist Ernest Rutherford (1871–1937) at the University of Manchester in England fired alpha particles, the nuclei of helium atoms, at thin sheets of gold. Most of the particles passed through the sheets, leading Rutherford to conclude that the atom was mostly empty space. A few particles were deflected, and some bounced back as though they had collided with a massive substance. The atom must therefore have a massive dense core. Because alpha particles were positively charged, the core of the atom must also be positively charged to account for the repulsion of the alpha particles that had come too near the core. The core, or nucleus, contained most of the atom's mass, and around it moved electrons in an orbit. Rutherford's model of the atom was

➤ NIELS BOHR

The son of Christian Bohr and Ellen Adler, Niels Henrik David Bohr was born October 7, 1885, in Copenhagen, Denmark. Bohr received an MS in physics in 1909 and a PhD in 1911. Upon completing his doctorate, he worked in the laboratories of Joseph J. Thomson at Cambridge and Ernest Rutherford at the University of Manchester. In 1913 the University of Copenhagen appointed Bohr lecturer in physics and in 1916 professor of theoretical physics. In 1921 the university founded the Institute of Theoretical Physics, which Bohr would direct until his death. His work on atomic structure won him the Nobel Prize in Physics in 1922. In the 1930s he concentrated on identifying the building blocks of protons and neutrons, work that others would carry to fruition in the 1960s. The German conquest of Denmark led Bohr to seek refuge in Sweden, England, and eventually the United States. Working on the Manhattan Project, Bohr failed to persuade President Franklin D. Roosevelt and British prime minister Winston Churchill to include the Soviet Union in its research on the atomic bomb. After the war Bohr focused on the peaceful uses of atomic energy and opposed the arms race. He died in Copenhagen on November 18, 1962.

—*Christopher Cumo*

much like a miniature solar system. If electrons moved around the nucleus, they must use energy. With nothing to give them energy, electrons must slow and, being attracted to the nucleus, spiral into it, collapsing the atom. The fact that this did not happen meant that Rutherford's model of the atom was incorrect.

Rejecting the solar system model of the atom, Danish physicist Neils Bohr (1885–1962) in 1913 asserted that electrons occupy energy levels. At a lower level an electron is stable and not in danger of spiraling into the nucleus. An electron has some quanta of energy. When an electron absorbs energy, it jumps to a higher energy level. When it returns to its original level, an electron emits a photon of light. In this model of the atom, Bohr borrowed from the work of German physicists Max Planck (1858–1947) and Albert Einstein (1879–1955), both of whom described energy in terms of a fundamental unit, the quantum.

In 1923 French physicist Louis de Broglie (1892–1987), borrowing the idea that particles and waves are two manifestations of the same phenomenon, asserted that electrons are not merely particles; they are also waves. The atom therefore contains electron-waves that oscillate around the nucleus. A wave can only occupy distances from the nucleus that are whole-number multiples of the wavelength of each electron-wave. What Rutherford had described as an orbital, de Broglie described as an electron-wave. As was true of Bohr's model, an electron could only occupy discrete spaces in the atom.

Retaining de Broglie's notion of an electron-wave, German physicist Erwin Schrodinger (1887–1961) emphasized in the late 1920s the impossibility of pinpointing the location of an electron-wave. At best one could express only some probability that an electron-wave occupied a region of the atom. Schrodinger's compatriot Werner Heisenberg (1901–1976) went further than Schrodinger in abolishing all models of the atom. One could never pinpoint anything in the atom with certitude, making futile the attempt to visualize the atom. For Heisenberg, the atom had a structure but one that was fundamentally unknowable.

In contrast to Heisenberg, Rutherford and his postdoctoral students continued to believe that the atom's structure was knowable. In pursuit of this structure, one of Rutherford's students, James Chadwick (1891–1974), discovered that in addition to protons, positively charged particles, the nucleus of most atoms also contains neutrons, particles with the same mass as protons but without an electrical charge. Because neutrons have no charge, they could be fired at the nucleus of an atom without being repelled by the protons. In the 1930s, German physicists Otto Hahn (1879–1968) and Friedrich "Fritz" Strassmann (1902–1980), the Austrian-born Lise Meitner (1878–1968), and the Italian physicist Enrico Fermi (1901–1954) bombarded the nucleus with neutrons. Under this assault the nucleus split apart, converting a tiny amount of matter into energy in accord with Einstein's equation $E=mc^2$. Because the speed of light squared equals 90 million billion meters per second squared, the nucleus of an atom contains enormous energy. The belligerents in World

War II attempted to build an atom bomb based on the work of Hahn, Meiter, and Fermi. The United States succeeded in 1945, dropping two atom bombs on Japan and bringing about the end of World War II.

Putting aside Heisenberg's insistence that the structure of the atom is unknowable, one might visualize the atom as vast stretches of empty space, as Rutherford had urged, with a massive dense core. In this nucleus, physicists have since the 1960s identified still smaller particles that are the building blocks of protons and neutrons. U.S. physicist Murray Gell-Mann (1929–) identified the quark as the constituent of protons and neutrons and therefore of all matter. The electron, however, is not composed of quarks but is itself a fundamental particle. The electron occupies the empty space of the atom, but where precisely is a matter of probability rather than certainty.

Uncertainty Principle

The uncertainty principle, an aspect of quantum theory, departed from the classical physics of the nineteenth century. Classical physics held that one can measure quantities with precision: the amount of heat that an object radiates, the position of an object, the speed and momentum of a moving object, time, and numerous other quantities. This claim of classical physics, in line with common sense, was unchallenged until 1927, when German physicist Werner Heisenberg derived the uncertainty principle.

The uncertainty principle held that classical physics applied only to the macroatomic world. The subatomic world did not behave according to classical physics. Consider the attempt to fix both the position and momentum of an electron as it moves around the nucleus of an atom. To fix the electron's position, one must aim a wave of light

➤ HEISENBERG ON UNCERTAINTY

In his Nobel Lecture, delivered on December 11, 1933 (after being awarded the prize in 1932), Werner Heisenberg explained the importance of the principle of uncertainty to quantum theory:

“The perturbation of the system to be observed caused by the observation is also an important factor in determining the limits within which a visual description of atomic phenomena is possible. If there were experiments which permitted accurate measurement of all the characteristics of an atomic system necessary to calculate classical motion, and which, for example, supplied accurate values for the location and velocity of each electron in the system at a particular time, the result of these experiments could not be utilized at all in the formalism, but rather it would directly contradict the formalism. Again, therefore, it is clearly that fundamentally unverifiable part of the perturbation of the system caused by the measurement itself which hampers accurate ascertainment of the classical characteristics and thus permits quantum mechanics to be applied.”

at it. The light will rebound from the electron to the observer, just as light rebounds from a mirror to the eye. A physicist would prefer to use a low-energy long-wavelength wave of light in hopes of causing the least disturbance to the electron. But such a wave of light has a margin of error as large as the wavelength is long. A short wavelength of light will more accurately locate the position of the electron, but this wave has high energy that will knock the electron from its path, changing its momentum. One cannot therefore measure both the position and momentum of an electron with precision. The very act of trying to measure something in the subatomic world disturbs that world, making impossible a precise measurement of its properties. Physics therefore was a study not in precision but rather in probability.

The assertion that precise measurement in the subatomic world was impossible created a stir among physicists. Danish physicist Neils Bohr joined Heisenberg in supporting the uncertainty principle, but German physicist Albert Einstein, believing that physicists could know something with more than a degree of probability, broke from Heisenberg. Einstein believed, contrary to the uncertainty principle, that physicists could know the properties of an object with certainty, and he challenged Bohr and Heisenberg with a thought experiment. Suppose one has a box with radioactive atoms and a clock to measure time. At precise times a door to the box opens for an instant, allowing subatomic particles emitted by the radioactive atoms to exit the box. At the end of the experiment one will know how much time elapsed with precision. If one weighed the box both before and after the experiment, one may calculate with precision the amount of energy given off by the radioactive atoms during the experiment. One can therefore know properties in the physical world with precision and not merely to a degree of probability. Although Einstein had been an early architect of quantum theory, his estrangement from the uncertainty principle led him away from quantum theory. Despite Einstein's defection, a new generation of physicists, many of them younger than he, came to accept the uncertainty principle. The battle over the uncertainty principle was something of a generational struggle, with the older Einstein ceding ground to the younger Heisenberg.

Continental Drift

The first half of the twentieth century marked a period of increasing debate over long-held geological principles, which ultimately resulted in one of the most significant revolutions in mod-

ern scientific thought. Whereas nineteenth-century geologists believed that the earth was cooling down and that the rate of its movement was in decline, by the 1960s the theory of plate tectonics had convinced scientists that the earth's landmasses were like rafts of lighter rock floating on the plates beneath them.

The continental drift hypothesis was first presented as a serious scientific proposal by the German geophysicist Alfred Wegener in 1912 and reached a wider audience in 1915 with the publication of his book, *Die Entstehung der Kontinente und Ozeane* (*The Origin of Continents and Oceans*), translated into English in 1924. Wegener was certainly not the first person to notice that the coastlines of Africa and the Americas looked like interlocking pieces of a jigsaw puzzle, separated by the Atlantic Ocean, but he was the first to systematically build a comprehensive theory that sought to make sense of this phenomenon. His interest was driven by the discovery of identical or near-identical fossils of animals in Africa and South America, suggesting that the two continents must have been connected. Previously, scientists seeking to explain these floral and faunal similarities had suggested that a land bridge had formerly crossed the South Atlantic Ocean long ago; some even speculated that the Atlantic Ocean had been formed over the former continent of Atlantis or out of an enormous valley. Alternative theories of independent evolutionary development seemed far too improbable.

But Wegener showed that there was no indication of any such land bridge and produced further supporting evidence for what he called continental displacement by stressing geological similarities on both sides of the ocean. To illustrate, Wegener offered a comparable analogy: "It is just as if we were to refit the torn pieces of a newspaper by matching their edges and then check whether the lines of print run smoothly across," he wrote in *The Origin of Continents and Oceans*. "If they do, there is nothing left but to conclude that the pieces were in fact joined this way." As his hypothesis began to take shape, Wegener posited that the world had consisted of a supercontinent or protocontinent during the Mesozoic era. He called this continent Pangaea. Relatively recently, in geological time, Pangaea

had begun to fracture, and the fragments had separated and moved away from one another, thereby creating the continents with which we are familiar. According to Wegener, this also explained the mountain ranges along the western fringes of North and South America; if the continents were pushed laterally across the earth's surface, friction would cause the leading edge of the continental plate to crumple, creating mountain ranges.

In general, Wegener's contemporaries—especially those based in North America—were not convinced by his continental drift theory. It was especially difficult to imagine large continents forging across the sea floor without a plausible explanation for what kind of forces could move such large masses of solid rock over such significant distances. The older theories maintained that the earth's surface—rather than shifting laterally—was forced up and down as its crust relieved pressure brought on by the cooling interior, which reduced in volume. This disagreement on how the earth moved was the focal point of nineteenth-century earth sciences. Nineteenth-century geologists were divided between catastrophists and uniformitarians, with catastrophists insisting that changes to the earth occurred sporadically and violently, while uniformitarians supported the idea that the earth endured a relatively steady state of change over a much longer period of time.

By the beginning of the twentieth century the catastrophists were in the ascendancy, but Wegener's theories offered ammunition for uniformitarianism, sparking debate. Wegener's work also contained some important weaknesses that would eventually be resolved, but not before his death in 1930 while on an expedition in Greenland. Most significantly, Wegener's belief that the continents were like ships that plowed through the ocean floor proved weak. Wegener thought, incorrectly, that the underlying heavier oceanic crust of *sima*—rock comprised mainly of silicon and magnesium—was static. The result made it supremely difficult to effectively argue that the continents were pushed across this surface without colossal friction. Undaunted, Wegener proposed that the crust was not rigid but instead was susceptible to continuous pressure that might allow the con-

Alfred Wegener's pictorial description of continental drift.
(United States Geological Survey)

tinents to drift. Even this was dubious; the English geophysicist Harold Jeffreys dismissed this hypothesis when he correctly observed that a large mass of solid rock could not possibly plow through the ocean floor as Wegener suggested without breaking up.

Some of Wegener's critics also took issue with his credentials. Wegener had been trained as a meteorologist rather than a geologist. Several critics chastised Wegener for his attempts at adopting geology, paleontology, and paleoclimatology to support his claims. Furthermore, it did not help that he was German at a time of rising anti-German sentiment. The Yale University paleontologist Charles Schuchert, for example, dismissed continental drift as a "German theory." These disputes over professionalism were, on some level, justified insofar as Wegener did tend toward generalization, but they also smacked of tensions in the profession between newcomers such as Wegener, with a geophysics orientation, and an old guard that relied more on data collection. Nevertheless, Wegener's lack of specific training in geology might have actually provided

the intellectual flexibility to develop a completely novel interpretation about earth movement.

His bigger idea that the continents had once composed a single continent and were now drifting across the planet's surface persisted and gave rise to the modern theory of plate tectonics. The threat of submarines during World War II and later during the Cold War created a context for geophysicists to engage in careful study of the sea floor. The discoveries from these studies justified Wegener's claims and provided the vital missing evidence. As heat from the center of the earth moved toward the mantle, it dispersed from hot places to cooler places. In so doing, the heat energy moved rocks slowly below the earth's surface, which in turn dragged the crust that lay over them, thus causing the continents to move. By the 1960s continental drift had supplanted older theories and at the same time supplanted scientific definitions of what constituted good science.

Eugenics

In 1883 British mathematician Francis Galton coined the term “eugenics” from the Greek *eu-genes*, for well-born. Whereas his cousin Charles Darwin had identified natural selection as the mechanism of evolution, Galton believed that humans could transcend natural selection by shaping their own heredity through selective breeding. According to Galton, the mating of the intelligent and industrious would yield the well-born, whereas the mating of degenerates would produce criminals and the insane. The goal of

eugenics was to encourage the breeding of superior humans and to discourage the breeding of inferior people.

Adherents labored to make eugenics a science. They grounded their work in the selective breeding of crops and livestock at the agricultural colleges, noting with regret that some scientists paid more attention to the breeding of corn than to the breeding of humans. Rejecting the position that both heredity and the environment shape humans, eugenicists focused on selective breeding because they believed that heredity alone codified the destiny of humans. Eugenicists scoffed at social workers who believed that improvements in nutrition and education could better the lives of the poor. The poor were degenerates who had fallen into poverty through a lack of innate talent and ambition. No amount of social engineering could change their fate.

The rediscovery and application of Mendelian genetics after 1900 seemed to strengthen eugenics. Austrian monk Gregor Mendel had understood that particles (genes) code for traits and pass from generation to generation. From this insight, eugenicists argued that a small number of genes are coded for intelligence, frugality, or industriousness on the one hand and stupidity, prodigality, and sloth on the other hand. Furthermore, eugenicists compiled pedigrees to chart the passage of these characteristics through the generations of a family.

The movement toward intelligence testing in the 1910s further emboldened eugenicists, who claimed that these tests measured innate intelligence and so ranked the inherent cognitive abilities of the people who took them. Eugenicists used the term “feeble-mindedness” as a blanket condemnation of people with low scores, though eugenicists could not agree on the score that separated a “feeble-minded” person from someone with a low but functional level of intelligence. As a rule, immigrants scored lower on intelligence tests than did native-born Americans, enhancing the claims of eugenicists that some races were genetically inferior to others.

The shift in the debate from the individual and the family to the race marked the most sinister phase in eugenics, which came to be more a social and political movement and less a science. Eugenicists in the United States, heirs to centu-

ries of racism, identified blacks as the cauldron of harmful genes and decried miscegenation. In 1920 Indiana barred the marriage of a white person to a person who was as little as one-eighth black, and more than half the states had laws against miscegenation. In 1924 the U.S. Congress passed the Immigration Restriction Act, reducing the number of immigrants from Southern and eastern Europe. Eugenicist Harry Laughlin's testimony, arguing that such immigrants were feeble-minded, was a major factor in convincing Congress that such legislation was appropriate.

The restriction on immigrants did nothing to solve the eugenicists' problem of what to do with the "degenerates" already in the country. In both the United States and Germany, authorities took alarm at the burgeoning populations in prisons and mental institutions. These people, housed and fed at taxpayer expense, did not have the biological potential to contribute to society, according to eugenicists. If one could do little to salvage the current generation, one could reduce the future population of degenerates by sterilizing criminals and the insane. Indiana passed the first sterilization law in 1907, and between 1910 and 1941 surgeons reportedly sterilized more than 38,000 criminals, the mentally ill, and the feeble-minded in the United States. Furthermore, it is estimated that between 1933 and 1937 Germany sterilized 400,000 detainees in prison and mental institutions. Going a step further in an attempt to rid the country of degenerates, Germany began a euthanasia program in 1939, killing a reported 70,000 mental patients by 1941. The Nazi effort to purge Germany of inferior races led to the Holocaust. In distorted form, eugenics thus contributed to the death of millions.

With the Holocaust fresh in the minds of many, scientists fled from eugenics. By 1945 the movement seemed to be dead. In the long term, the fate of eugenics is less clear than it appeared in 1945, with some social critics wondering if later efforts at population control are nothing more than a form of eugenics.

➤ FORCED STERILIZATION OF THE "FEEBLE-MINDED"

The following excerpt, from a U.S. Supreme Court decision written by Oliver Wendell Holmes Jr., indicates the extent to which eugenics was accepted doctrine in the early twentieth century:

"Carrie Buck is a feeble-minded white woman who was committed to the State Colony above mentioned in due form. She is the daughter of a feeble-minded mother in the same institution, and the mother of an illegitimate feeble-minded child. She was eighteen years old at the time of the trial of her case in the Circuit Court in the latter part of 1924. An Act of Virginia approved March 20, 1924 (Laws 1924, c. 394) recites that the health of the patient and the welfare of society may be promoted in certain cases by the sterilization of mental defectives. . . .

We have seen more than once that the public welfare may call upon the best citizens for their lives. It would be strange if it could not call upon those who already sap the strength of the State for these lesser sacrifices, often not felt to be such by those concerned, in order to prevent our being swamped with incompetence. It is better for all the world, if instead of waiting to execute degenerate offspring for crime, or to let them starve for their imbecility, society can prevent those who are manifestly unfit from continuing their kind. The principle that sustains compulsory vaccination is broad enough to cover cutting the Fallopian tubes."

The Big Bang

A cosmological model, the Big Bang Theory, a phrase coined by a detractor, states that the universe began some 13.7 billion years ago. At the beginning of time the universe was a tiny, dense ball of energy. This energy rushed out in all

➤ EDWIN POWELL HUBBLE

Born on November 20, 1889, in Marshfield, Missouri, Edwin Powell Hubble studied mathematics, astronomy, and philosophy at the University of Chicago, earning a BS in 1910. A Rhodes scholar at Oxford University, Hubble initially studied law but instead switched to Spanish, receiving an MA in 1913. Back in the United States, he taught at New Albany High School in Indiana and was admitted to the bar in Kentucky. Having no interest in law, Hubble returned to the University of Chicago from which he received a PhD in 1917. In 1919 he joined the staff at Mount Wilson Observatory, where he remained the rest of his life. His fame rests on his confirmation of the redshift, an insight he used to demonstrate that the galaxies were moving away from each other. The victim of a blood clot in the brain, Hubble died on September 28, 1953, in San Marino, California.

directions into space in an explosion. The initial phases of this explosion lasted only 10^{-43} seconds. During this instant, all four forces in the universe—gravity, electromagnetic force, and the weak and strong nuclear forces—equaled one another, implying that they may all have been a single force in the first instant in time and only became independent forces during the initial expansion. In the second stage of the universe's expansion, the inflation era, the universe expanded at a rapid rate. During this stage, some of the energy from the initial surge began to form quarks, electrons, protons, and neutrons, the building blocks of all matter. Lasting for roughly 100,000 years, the third stage of the Big Bang spawned the formation of hydrogen and

helium, the first two elements on the Periodic Table. These elements formed all the heavier elements, such as carbon and oxygen, that are essential for life. During the last stage of the Big Bang the stars and planets coalesced out of hot gases, and the universe assumed its characteristic form.

The belief in the stasis of the universe is as old as humanity, but in the twentieth century astronomers would overturn this idea in favor of an expansionary universe. As a theory, the Big Bang did not originate with one scientist. As is true of many discoveries, several people shared credit for shaping this theory. In 1912 American astronomer Vesto Slipher discovered that light from distant stars reached earth as long-wave

light (infrared light, for example), whereas he had expected short-wave light (ultraviolet light, for example). The wavelength of this light had stretched because, Slipher realized, the stars were moving away from earth. The stretching of these stars' wavelengths shifted their light spectrum toward the color red. For this reason, this change in wavelength is known as the redshift. In the 1920s American astronomer Edwin Hubble announced that these stars were part of other galaxies that were moving away from earth and from one another.

In 1931 French astronomer and philosopher Georges Lemaitre realized that all galaxies were rushing away from one another as though they had been shot out of a cosmic cannon. The universe must be expanding. This expansion must have arisen from a primordial explosion in the distant past. In the 1940s Soviet physicist George Gamow and American physicist Ralph Alpher, accepting Lemaitre's ideas, postulated that the universe should contain large amounts of microwave radiation, a residual form of energy left over from the Big Bang. In 1964 the Soviets A. G. Doroshkevich and Igor Novikov detected this background radiation. That year, Bell Laborato-

ries scientists Arno Penzias and Robert Wilson verified the Soviets' findings. The work of these four confirmed the Big Bang Theory.

The Big Bang Theory may illuminate the fate of the universe. Scientists must determine whether the universe will keep expanding or whether this expansion will slow down, halt, and finally lead the universe to collapse upon itself. At issue is whether the universe has enough matter for gravity to overcome the forces of expansion. There is no consensus, although the majority holds that the universe will expand forever, growing colder in the process until it is a lifeless collection of matter and energy, scarcely above absolute zero.
